For some years it had been drifting about like a sea-swept derelict. On one occasion, it was moved from Philadelphia to Germantown on account of an epidemic of yellow fever. Provision was made when Congress moved to Washington in 1800 for its temporary transfer to any advantageous neighborhood in that locality in case the official headquarters were threatened by dire disease, plague or epidemic. The original district covered an area a little larger than 100 square miles and is the only independent capital ever established anywhere. Today, this tract has been reduced to approximately 69 square miles, as in 1846 in compliance with a petition from the property owners who lived west of the Potomac that portion of the original territory was ceded back to Virginia. Peculiarly enough, the residents of that section, at present have formed an organization and are doing everything in their power to get Congress to restore their region as part of the District of Columbia. This area includes Arlington Cemetery, Fort Meyer military reservation and about 31 square miles of country which now are governed by Virginia.

In the early days, Washington was called the Federal City, while the District was known as the Territory of Columbia.

George Washington was indefatigable in his efforts to make the city named in his honor one of the powers of the world. It was he who selected the site of the national capital. His plans were to develop the Federal City—this was the name he preferred for Washington city—into the "greatest commercial emporium of the country." He wished to establish there a wonderful national university and even left a legacy on his death for that purpose. George Washington was farsighted enough to predict at the time when Major Pierre Charles L'Enfant, a French engineer, was designing and laying out the city, that Washington would one day become "the greatest of all the international headquarters." George Washington, Thomas Jefferson, Monsieur L'Enfant and Andrew Ellicott, who succeeded the Frenchman as chief engineer, are all responsible for the magnificent proportions, remarkably wide streets and avenues and attractive layout of Washington, which was patterned after the design of Paris.

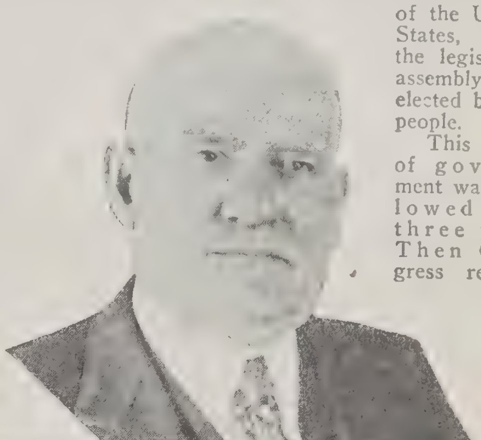
The Capitol of the District of Columbia.
At left—C. H. RUDOLPH, a District Commissioner.

George Washington closed the deal with the 20 original landowners who were proprietors of the 6,511 acres of land, which originally went to make the city of Washington. The United States Government purchased 540 acres of land as sites for public buildings and grounds. The property owners donated all the land for the streets, avenues and alleys and also gave Uncle Sam one-half of the 20.272 lots which were laid out. The government sold its share of these lots and devoted the proceeds to paying for the other land it bought. It is interesting to note that this land cost the equivalent of $66 66 an acre in Pennsylvania currency of that time. In 1800, the population of the District of Columbia was 14,093; it increased to 24 023 ten years later and more than doubled between that date and 1850.

The first few years, building progressed briskly and Washington boomed. Then the city slumped. Congress moved into the new Capitol and was dissatisfied with everything. The building was only half completed. The national lawmakers refused to appropriate more funds to finish the building, because government cash was frightfully short. Even Mrs. Adams registered protests from the White House that conditions were almost unendurable. For the following 71 years, the District of Columbia—Dead Center would have been an appropriate nickname—and the city of Washington practically stood still so far as development abetted by Federal aid was concerned. All that was accomplished was owing to the untiring efforts of the Washingtonians, who shouldered heavy taxes and assumed overpowering burdens, all for the good of a splendid cause which had been fostered by George Washington and neglected lamentably by his successors, who wore the togas of statesmanship.

The first government of the city of Washington in 1802 consisted of a mayor, appointed by the President of the United States and a city council, elected by the people of the city. A decade later, a change was made and the council was empowered to elect the mayor. Ten years thereafter, still another shift occurred, inasmuch as the people were given the right to ballot for the mayor, who was elected for a term of two years. This method of running the capital city continued until 1871. That year, by special act, Congress formulated a territorial form of government for the District of Columbia, consisting of a governor, a board of public works and a legislative assembly of 11 members, called a council, and 22 members, known as a house of delegates. The district was then allowed to have one delegate in the national House of Representatives. The governor and board of public works were appointed by the President of the United States, while the legislative assembly was elected by the people.

This form of government was followed for three years. Then Congress revolutionized the entire system and provided that the District of Columbia should be supervised by three commissioners appointed by the President. This method was followed for four years and was so successful that a special act of Congress of June 11, 1878, was formulated to establish it as a permanent institution. Two of the commissioners are selected at large by the President from actual residents of the District of Columbia, who have lived there for at least three years. The third commissioner is an army officer detailed by the President. Each of the commissioners serves for three years and receives an annual salary of $5,000. The commissioners are responsible to special committees of Congress for the faithful performance of their many duties.



JAMES F. OYSTER.
District Commissioner.

Each year, the commissioners have to submit an estimate of the funds needed for running the District the following 12 months. These estimates go to the director of the budget of the Treasury Department and thence to Congress. When this legislation is passed by both the House and Senate and is signed by the President, it becomes a law.

All legislation for the District of Columbia, other than appropriations, comes under the jurisdiction of a committee on the District, of which there is one in the House and one in the Senate. Whenever the District commissioners desire that a new law be passed, recommendations are made to these committees that such legislation be enacted. The committees carefully consider each measure and if satisfied that it is worth while, they advise the House and Senate, respectively, to make the new laws which become official when accepted and signed by the President. All bills pertaining to the District of Columbia must be introduced through these committees.

The present land area of the District of Columbia aggregates 39,200 acres, while there is an additional 5,116 acres of waterlogged surface. Altogether in the city of Washington right now there are 90,000 buildings of all classes, including 1,000 large apartment buildings, 3,000 small apartment buildings, 88 commercial hotels and 70 theaters. The remaining buildings consist of government and municipal structures, private dwellings, estates and stores.

The three district commissioners—the present incumbents are C. H. Rudolph, J. F. Oyster and Colonel Charles Keller, engineers' corps—are required by Uncle Sam to act as a public utilities commission.

The curious District of Columbia, unlike any other tract of land in all creation, has practically no bonded or floating indebtedness, as its sinking fund is sufficient to liquidate all indebtedness at maturity.

Canada's Attempt at Movie Independence

Dominion's Own Sons Filming Pictures That Portray Real Life

By D. M. LE BOURDAIS

IT IS estimated that the thousand-odd motion picture theaters in Canada pay about $12,000,000 annually into the coffers of American film companies and distributors. This represents only the money that goes into rentals; the Dominion's total movie expenditure is probably 10 times that amount.

That is a lot of money to spend for motion pictures, but it would not be so bad if the people were getting what they want. Not only are they growing somewhat tired of Hollywood's idea of motion picture values, but there has recently been a run on "Canadian" pictures of the "Far North" (made in U. S. A.) which have particularly filled them with disgust.

One may entertain a shrewd suspicion regarding the reality of the local color in a picture portraying life in India or Africa, but when the scene is laid in one's own country all doubts on that score are dispelled. This is one of the reasons why Canadians have shown a disposition to encourage in a material way the recent attempt to produce home-made motion pictures; but perhaps the chief reason is to be found in the development of a Canadian national consciousness whose effects are likewise being felt in art, literature, the drama and in politics. This has been particularly marked since the war. It is safe to say that there are more men and women engaged seriously in the creative arts in Canada today than ever before in the history of the Dominion. Canada's demand for representation at the Peace Conference and in the League of Nations was the expression of this sentiment in the political realm.

Coming back, however, to the subject of motion pictures, a little reflection will show that the stirrings of national sentiment in this field are subject to limitations in their application which do not pertain to literature and the arts. Producing pictures is both an art and a business—at least it *should* be an art, but it must be admitted with regret that it rarely rises much higher than a business. To produce books requires both business and artistic capabilities, but publishers at least confine their efforts to the business end of the transaction and recognize that the writing of books is quite another matter. But in the motion picture industry (it is no accident that it is never referred to otherwise than as an *industry*) recent graduates from the cloak and suit trade seem to consider themselves peculiarly qualified to set the standards.

To make a picture of any size at all is an expensive undertaking at best, and hitherto it has been the man with the money who has dominated the situation. In the early days of the industry in the United States there were many failures; and financial houses ordinarily considered reputable would not undertake the financing of motion picture companies; but as the enormous possibilities of the industry became evident it was not long before the most conservative of financial houses found it quite in accordance with their dignity to participate in the easy profits. The huge population in the United States provided a ready market for more pictures than the producers could supply.

Canada, on the other hand, was a vast country very sparsely populated and divided into sectional regions whose interests and viewpoints varied considerably. The prospective producer could not count on a great home market for his initial return and in addition must compete with pictures from across the line which were produced at less cost and which had probably already repaid the cost of production in their own country. But the chief drawback to production in Canada was the lack of established financial machinery.

Just as it was due to individual private investors that the United States industry got started 20 years ago, so was it also due to private individuals—as distinguished from financiers—that pictures came to be made in Canada. But whereas the hope of financial return was the only incentive of the pioneer investors in the motion picture industry in the United States, in Canada the stirrings of nationalistic sentiment to which I have already referred was the chief incentive.

In art, literature and the drama a development such as this can be immediately manifested in the production of paintings, books and plays—not much organization is needed, and practically no capital. (This is not entirely true as regards plays.) But motion picture making is not such an individual effort. The nationalistic revival provided the opportunity, but it remained for some individual to take advantage of it and organize those who were willing to provide the financial backing for the production of Canadian pictures. This man appeared in the person of Ernest Shipman.

ERNEST SHIPMAN

Shipman is a Canadian who, like many others, as a young man found wider opportunities in the United States than in his own land. For a number of years he "trouped" the country with road shows. In 1910 he became interested in the motion picture industry and in 1919 went into production for himself. Although he had spent most of the years of his manhood in the United States, Shipman still retained his interest in his native country, and it was perhaps natural that he should have been one of the first persons in the motion picture industry to realize the possibilities of the Canadian field. While, as has been said, Canada lacks the element of a large population, it was believed that Canadian-made pictures would be popular in the United States; and in addition the British Empire market could undoubtedly be tapped much better from Canada. The tendency of the various British countries to enact preferential tariffs with respect to the products of each other was not lost sight of. Then again, the romantic history of Canada and the beauty and variety of Canadian scenery were inducements which carried additional weight.

Before undertaking production in Canada, Shipman had made a number of pictures in the United States, filming some of James Oliver Curwood's stories. These stories set him wondering about the possibility of producing Canadian stories in their original settings. The first attempt was made in Calgary and Winnipeg. Shipman got the leading literary and financial people together and placed the matter before them. As a result a local company was formed and sufficient money was subscribed to defray the cost of making two pictures. These were "The Foreigner" and "Cameron of the Royal Mounted," both adaptations of books by the well-known Canadian writer, Ralph Connor.

In 1922 Shipman produced four all-Canadian pictures. Two of these were made in Ottawa. They were also picturizations of books by Ralph Connor—"The Man From Glengarry" and "Glengarry School Days"—and were directed by Henry McRae, like Shipman, a former Canadian who had spent most of his life in theatrical work in the United States, but whose youth had been spent amid such scenes as are described by Ralph Connor.

As those who have read "The Man From Glengarry" will remember, it is a story of the days when the Ottawa Valley was the great logging and lumbering center of the Canadian woods—the days when Robert Dollar, perhaps more familiar to magazine readers as the original of Peter B. Kyne's "Cappy Ricks," was learning the lumber business on the Ottawa River. The Ottawa is yet a great logging stream and a number of the greatest lumber companies in the world still operate on it and its tributaries. The filming of a story so intimately identified with the life of the river could not fail to be of interest to these men of the woods; and one of the largest companies placed its facilities at the disposal of the director. In this way it was possible for McRae to photograph scenes under actual logging conditions. Instead of extras being hired for the occasion, and made up to impersonate loggers, actual rivermen were loaned by the company and rode real logs, broke up real log jambs and lent an air of reality to the scenes such as actors, no matter how carefully coached, could never have produced.

This co-operation by the lumber company is typical of the attitude taken by the people of Canada generally toward the attempt to develop Canadian pictures.

In the second picture made at Ottawa, "Glengarry School Days," the script required certain scenes to be laid in the Parliament buildings. Government authorities are usually very chary about creating precedents which might become inconvenient at some future time, but in this case permission was granted for the movie people to set up their lights and equipment in the Senate chamber itself and enact their scenes under circumstances which are undoubtedly unique.

It was the same with the raising of capital: men who as a matter of investment probably would not have been interested in a venture in the motion picture field were willing to provide money and lend their support for much the same reason as that which actuated the lumber company referred to and the government authorities.

Shipman is fortunate in this respect in being the pioneer. It is doubtful if future companies will be allowed to disorganize the arrangements of large logging crews or to transform the august precincts of the Senate into a movie studio; but these instances indicate the extent to which the people of Canada are sincere in their desire for Canadian films.

In Sault Ste. Marie, Ontario, another Shipman company produced a picture called "The Rapids," an adaptation of a book by Alan Sullivan. Here, as at Ottawa, hearty co-operation between the people of the community and the company was responsible for the incorporation of much interesting local color into the picture.

Down by the sea, at St. John, New Brunswick, Shipman has produced a picture of seafaring life called "Blue Water" from a book by Frederick William Wallace, whose sea stories have become popular both in Canada and the United States in recent years. It attempts to portray the interesting life of the men who go down to the sea in ships.

For the year 1923, Shipman has already arranged to make pictures in Halifax, Vancouver, Charlottetown and St. John's, Newfoundland; while tentative plans have been laid to produce pictures in Montreal, Toronto, Hamilton, London and Windsor.

While Ernest Shipman is by far the most notable among those who are attempting to develop the Canadian motion picture field, he is not the only one; several other companies have been established in various portions of the Dominion, but so far none has achieved the degree of success that he has.

Perhaps the most successful effort in this direction has been made by the Dominion Govern-

St. Augustine—Our Last Spanish Landmark

Concluded from page 6

as wide at the top. The terreplein is 40 feet square and provided mountings for 60 large guns. A unique feature was specially constructed hot-shot furnaces, so constructed that they would discharge red-hot cannon balls at the enemy. The esplanades, barbicans, drawbridges, arched entrance, vaulted casements, frowning bastions, ornate sentry boxes and dark, mysterious dungeons emblematic of Spanish fortifications are still intact. About 85 years ago, two skeletons in cages were found in newly discovered dungeons. The chances are that they were the bones of prisoners tortured to death during the latter years of the Spanish rule. The old fort was rechristened Fort Marion after General Francis Marion of Revolutionary War fame when Uncle Sam took possession of Florida.

St. Augustine is the only town in America today whose portal is still guarded by a lofty city gate. This famous gate is all that remains of the old Spanish wall which ages ago extended across the peninsula and protected the city on the north. It is an appropriate frontispiece to the sea wall extending southward from Fort Marion along the water front for one and one-half miles. During the early years of the Seminole Indian War, Uncle Sam built this wall. Its granite coping four feet wide has since become the city's most popular promenade.

Everything of importance in St. Augustine radiates from the plaza, a one-acre park in the center of the city which accommodates the Federal post office that used to be the governor's palace. The old market place where slaves were sold side by side with ordinary farm produce a few score years ago remains. An interesting fact about the oldest houses is that they are minus either chimneys or fireplaces. Spanish style stoves in the form of metal urns containing red-hot coals were used to heat the rooms in the early days. A pyramidal monument in the middle of the parkway was erected more than a century ago in honor of the Constitution Plaza. This plaza was used as a parade ground by the English and later by the American soldiers. It is impressively set off by an imposing cathedral of Moorish and Spanish architecture ornamented with huge domes and pinnacled minarets which was built about the middle of the eighteenth century. It was once destroyed by fire but has been completely restored. An old bell in one tower bears the inscription, "A. D. 1682."

Several strange customs—carry-overs from the days of Spanish possession—are still observed religiously by the residents. On the evening before Easter Sunday, young men who sing go about the city serenading the homes of their friends.

About the time of the Civil War, wheeled vehicles were not allowed inside the gates of St. Augustine because of the ridiculously narrow streets which were not designed to accommodate carriage traffic. At that time some thoroughfares were only 10 feet wide and even today a few roadways are less than 20 feet across. These little streets were once insignificant donkey trails and passageways for equestrians, as horses were practically the only means of transportation. The overhanging balconies on many houses were originally built in that fashion so that neighbors could chat with one another without leaving their individual front verandas.

In the olden days, the stocks and pillory and the whipping post were satisfactory substitutes for the modern jail where lawbreakers are now imprisoned. That was during the days when the regular practice was to drum undesirable citizens out of town after their heads had been half shaved and they had been garbed in outlandish costumes. In the passing, it is notable that Florida and St. Augustine were great Tory centers during the Revolutionary War, Florida being the only one of the 14 British Colonies that remained loyal to King George III. When the news of the Declaration of Independence reached St. Augustine, the effigies of John Hancock and John Adams were burned in the plaza.

St. Augustine has no fewer than seven houses whose owners claim that theirs respectively is the oldest house in the United States. At present, the St. Augustine Historical Society operates the most famous of these ancient dwellings and states that this house was built in 1565 when the city was established. The house is built of coquina rock and this in itself refutes the preposterous contention, as this variety of building material was not discovered until 1580. Claim is also made that the house was originally the home of Franciscan monks. There were no monks of that order in St. Augustine in 1565. The house stands in the central portion of St. Augustine whereas if it had been built on the original site of the city it would have to be at least five miles south of its present location. The earliest habitations of the Spaniards at St. Augustine had neither fireplaces nor windows. This house has both these fixtures. It so happens that the archives of St. Augustine previous to 1702 were destroyed in one of the fires that swept the old city. The result has been that Florida fakers have made money at the expense of the credulity and historical ignorance of hundreds of thousands of tourists. The true record of the "oldest house" which still lures most of the visitors is that the structure is really a product of tradition. It was built about 1834 and latterly has been "dolled up" and advertised extensively.

Canada's Attempt at Movie Independence

Concluded from page 10

ment itself. A few years ago the Department of Trade and Commerce began making one-reel scenic and industrial films. The primary object was publicity for Canadian scenery and industries, but under the energetic direction of R. S. Peck, a former newspaperman who was placed in charge of the department, these one-reel features have created such a demand for themselves, not only in Canada but practically the world over, that they have become a standard feature on motion picture programs, and compete very successfully on the same rental basis with the products of the large American studios. They provide the theaters with convenient short films in which are combined high-class workmanship with a high degree of instructional and entertainment value and have more than demonstrated the fact that both the public and the exhibitors are eager to patronize pictures whose principal ingredient is not pure "hokum."

It may be asked what results the Canadian people have attained from this expenditure of money and interest in the manufacture of films at home. Are the films which have been made by Shipman's companies and others less filled with "hokum" than those manufactured across the line? And if so are they likely to succeed financially?—for, unfortunately, financial success is still the final verdict on any picture.

In reply, it must be admitted that there is still room for improvement. While Shipman is filming only the works of Canadians and is making the pictures under conditions which should insure the greatest degree of fidelity in the matter of local color, he himself is an organizer and promoter rather than an artist. The direction of the various pictures is perforce left largely to directors brought in from the United States, and these do not always succeed in throwing off their belief in the utility of "hokum," and, in this respect, from the standpoint of a Canadian critic, some of the pictures suffer; but on the other hand the claim is made that "hokum" is necessary to their financial success. That remains to be seen. One thing, however, is certain: in some of the pictures, notably "The Man From Glengarry," the scenery and the natural beauties reproduced are distinctly unusual, and that is a treat which should make up for quite a lot of "hokum."

It is entirely premature to say whether this Canadian declaration of independence will lead to anything permanent. But so far as it has gone it indicates a pretty general spirit of revolt throughout the Dominion against the sort of pictures which have been inflicted on the people in the past—which is also evidenced by decreasing attendance at all but the best movie theaters—as well as a widely extended desire on the part of the people to remedy the situation by taking matters into their own hands; merely from that standpoint alone the subject is interesting.

Loggers never have this sort of thing to contend with in real life, but it probably adds to the interest of the picture.

The boy is an actor, but the policeman is real. A scene taken in the parliamentary library at Ottawa with the statue of Queen Victoria in the foreground.

A movie director's idea of a loggers' battle filmed against a real logging background.

Does the Bank Give Credit, Or Do You?

Facts With Which Bankers Will Agree, and Which Others Ought to Know

By J. V. NASH

FROM time immemorial the issuance of money has been one of the prime functions of government. The principle underlying the government control of money has always been to protect the public against the exploitation of money, which is essentially *a public utility,* by private individuals.

The counterfeiting of money has ever been held an extremely heinous offense. A few centuries ago the penalty imposed for it was boiling alive in oil. Today conviction of this crime involves a term of many years in the Federal penitentiary and the government spends hundreds of thousands of dollars and employs hundreds of secret service men for the express purpose of preventing the counterfeiting of money.

Metal coins are counterfeited by debasement; that is, by manufacturing coins similar in appearance but beneath the standard in weight or purity. The metal money now in circulation is of such slight unit value, however, that this form of counterfeiting has to a great extent disappeared.

The physical substance of paper money, which forms the big end of our currency today, cannot, of course, be debased, since the value of the material in the paper money, either genuine or counterfeit, is practically nil. Yet the counterfeiting of paper money is regarded as just as serious an offense as the counterfeiting of coins.

The theory and justification of the penalizing of the counterfeiting of paper money is that the genuine paper gives the holder *title* to a certain quantity of gold, whereas the counterfeit does not. The proportion of the genuine paper money in circulation under our present banking laws which would pass that test is startling proof of the extent to which the bottom has dropped out of the gold standard.

Years Changed Conditions

WHEN the Constitution was adopted the privilege of issuing money and regulating the value thereof was surrendered by the individual states to the Federal Government, it being recognized even by the most extreme champions of States' Rights that the absolute sovereignty over the nation's money properly belonged to the central government.

In 1787, when the Constitution was framed, the United States was a small pioneer country of about 4,000,000 inhabitants, or less than the population of New York City today. The vast majority of the people were engaged in agriculture and lived on the products of the soil which they raised on their own farms.

There were no steamboats and no railroads, and as steam or electrical power had not yet been applied to manufacture, there were no great mechanical industries. There was a considerable foreign commerce, to be sure, but it was mainly conducted on the principle of barter. A sailing vessel loaded a cargo of smoked fish in Boston and took it to the West Indies, bringing back in exchange a cargo of molasses. This trade proved highly profitable; so much so, that rum and codfish laid the foundations of the fortunes of many a blue-nosed Boston family of the present day.

But in the first half of the nineteenth century the steam engine, invented by Watt, began to be applied to transportation and manufacture. For the first time in history, large-scale standardized production became possible. Factories sprang up all over the land and attracted from the farms thousands of workers by the lure of higher wages.

Great industrial cities now appeared on the map and labor became more and more specialized. A family no longer produced its own food or spun its own yarn for clothing. A worker produced but one article, or a single part of one article. He was dependent upon *exchange* for all other necessary commodities, and this exchange could be effected only by money.

Credit, Not Gold, Does Business

THE small amount of gold in circulation soon became utterly inadequate to carry the tremendous volume of exchange which the new economic system demanded. But the economists and the politicians were so firmly wedded to the gold theory of money that no effort was made to supplant it with another adapted to the changed conditions.

And so the shadow of the Gold Standard was preserved by the government. Meanwhile, however, the rapidly expanding commerce and industry necessitated an adequate supply of a medium of exchange, and privately owned banks came into existence to supply it.

This new medium of exchange is *credit.* Any textbook of economics today will admit that *95 per cent* of American business is now transacted not by Gold but by Credit. Credit, therefore, is the real money of the country. Individuals as well as business must have it in order to live; the government permits private organizations called banks to issue and control it as a profitable private business, so that not only the public but the government itself is in a fiscal sense dependent on a group of money exploiters.

The government, it is true, did in the early days attempt to assert its rightful control over the manufacture of this new kind of money.

The first American government bank grew out of a suggestion by Thomas Paine in 1780, and was established for the purpose of providing supplies for Washington's army. It achieved its purpose well and continued its operations until the close of the Revolution.

The Bank of North America, located in Philadelphia, was opened on January 7, 1783, with a capital of $400,000. Local banks were soon thereafter organized in New York and Massachusetts. The Bank of New York and the Massachusetts Bank of Boston both began business in 1784, the one with a capital of $500,000, and the other with a capital of $300,000.

These latter institutions were the germs of the great commercial banks of today. From these humble beginnings there has grown up the huge American commercial banking system which is being scrutinized today as never before because of a well-defined popular notion that this system blocks the access of the people and even of the government to the supply of *real money* which it is *the function of the government to issue and regulate* for the benefit of all.

The first official Bank of the United States, *the purpose of which was to make the government independent of the private bankers,* was established through the efforts of Alexander Hamilton when Secretary of the Treasury in 1791. It existed for 20 years. A leading historical authority says: "It was well managed and of great benefit to the government and to the people."

It assisted the United States Treasury with loans whenever called upon and received and disbursed more than $100,000,000 of government funds without the loss of a dollar. Its success aroused the envy of the private banks, which had meanwhile grown powerful, and *their influence over Congress prevented the renewal of its charter in 1811.*

The war of 1812 placed the government at the mercy of these *private banks, which promptly left it in the lurch and generally suspended specie payments.* The plight of the nation in 1814, in which year the National Capitol was burned and the President was for a time a fugitive, led to proposals to organize a second Bank of the United States to handle the fiscal affairs of the government. The commercial banks, for selfish reasons, hysterically opposed the measure, but Henry Clay fought for it, and finally, on April 10, 1816, President Madison signed the bill creating the second *United States Bank.*

It was to be given a charter for only 20 years, like its predecessor, and its capital was to be $35,000,000, of which amount the government was to subscribe $7,000,000.

In this second United States Bank the people had an agency through which the government might have developed and maintained a legitimate control over the issuance of that Credit Money which was destined in a few years practically to supplant Gold as the great medium of exchange.

Plot Wrecks U. S. Bank

THE story of the destruction of the second United States Bank is one of the most tragic chapters in American history.

The parent bank was located at Philadelphia and there were 25 branches scattered through the country, with a total of more than 500 employes.

> "In every state of the Union," says one of our historians, "and in many foreign nations of the globe, were stockholders of the Bank of the United States . . . . One-tenth of its stock was held by women, orphans, and trustees of charity funds. Its bank notes were as good as gold in every part of the country, from Maine to Georgia, from Georgia to Astoria. Men could travel and pass these notes at every point without discount, and it is said that in London, Paris, Rome, Cairo, Calcutta, St. Petersburg, and other prominent cities, the notes of the Bank of the United States were within a fraction more or a fraction less than their value at home, according to the current rate of exchange. They could actually be sold at a premium at the remotest commercial centers. It was not uncommon for the stock of the bank to be sold at a premium of 40 per cent. The directors of the bank were 25 in number, of whom five were appointed by the President of the United States. The bank and its branches received and disbursed the entire revenue of the nation."

The very prosperity of this great public bank created powerful enemies who conspired to destroy it. Its charter was to expire in 1836, and as early as 1831 attacks began to be made upon it for the purpose of preventing the renewal of its charter. The conspiracy finally succeeded in wrecking the bank. The deposits of the government were gradually withdrawn and distributed among privately owned institutions—"pet banks" of the administration in power—and the charter of the bank was allowed to lapse.

Thus the United States Bank, which had more than once saved the credit of the nation, was put out of existence. "It paid its creditors in full, principal and interest," says Horace White, "but the shareholders lost every penny." The government was not a loser. It recovered its $7,000,000 of stock in full and the records of the Treasury Department show that the United States realized a profit of $6,093,167.07 through its dealings with the bank.

Twenty-five years later, in 1861, on the outbreak of the Civil War, the government paid dearly for its folly in killing the public bank which had saved it in other emergencies. There was now no agency capable of handling the fiscal affairs of the nation. Private capital immediately fled to cover ("gold, the coward!") money was taken out of the banks and hoarded, and the banks suspended specie payments.

At the close of the Civil War the so-called National Banking System was put into effect. The National Banks, of course, are "national" only in name. They are really private corporations organized for private profit.

However, they were given the monopolistic privilege of issuing notes which were to all intents and purposes legal tender, secured not by gold but by government bonds *on which the government pays interest to the banks.* Today there is *nearly one billion dollars' worth* of these national bank notes in circulation, which the people are practically compelled to accept as money.

The National Banks soon secured the virtual control of the banking business in the United States. To force the national bank notes upon the people, by eliminating competition, the note issues of the small state and local banks were killed by a shameful method of accomplishing an illegal act indirectly. It is a proper function of any bank to issue circulating notes, and therefore the note issues of the local banks could not be prohibited by law.

But the purpose was achieved indirectly by taxation. There was no pretense that the purpose of the tax was to raise revenue. In 1865 a tax of 10 per cent, which was intentionally prohibitive in amount, was assessed by law upon the note issues of the state and local banks. This killed the notes, giving the National Banks a monopoly of the note-issuing field. *That law is in effect today.* (When a proposal was recently made to eliminate child labor by a prohibitive tax on its products, our courts shrieked with horror at the thought of using the taxing power to accomplish an ulterior purpose!)

Since then the growth of the banking business, as represented by the misnamed National Banks, has been one of the most amazing phenomena of our times. Consider the following figures:

Growth of "National" Banking

IN 1870 the number of National Banks in the United States was 1,526, with "deposits" (which will be explained later) of $542,261,563.

In 1890 there were 3,214 banks, with "deposits" of $1,521,745,665.

In 1922 the number had grown to 8,249, claiming deposits of $16,320,564,000.

The total actual capital (representing investment) of these 8,000-odd banks was, however, only $1,307,216,000 in that year; yet net earnings of $372,013,000 are reported.

The report of the Controller of the Currency, made public August 22, 1922, furnishes us with the consolidated balance sheet of all National Banks, as of June 30, 1922.

This itemized balance sheet shows "cash in vaults" to the amount of only $326,181,000, and undivided profits (less expenses and taxes paid) of $492,434,000.

Textbooks of economics define a banker as "a dealer in money." According to this definition, the *National Banks, as shown by their own accounting, are earning profits of 100 per cent a year on their stock in trade.*

In my last article I produced figures showing that whereas the total stock of gold, both coin and bullion, in actual existence in the United States amounted to only $3,294,909,763 in 1921, and the amount of "money" in circulation was $8,178,602,408, all banks reported in that year combined "deposits" of $35,459,155,000 (11 times the amount of gold in the country), and "resources" of $49,671,390,000 (15 times our stock of gold).

Clearing house reports likewise show *checks* to the value of $1,000 in circulation for every $1 of *currency.*

"Paper"—"Credit"—That's All

THE layman is apt to be deceived by the word "deposits" as used by the banks. He may innocently imagine that it represents gold or other lawful money placed in the keeping of the banks by the depositors. Nothing could be more untrue.

Horace White, in "Money and Banking," says:

> "The word *deposit,* when thus used, is clearly a misnomer, since by derivation and common understanding a deposit means a thing laid away or given in charge of somebody. It must be borne in mind, therefore, that bank deposits consist of two different things, namely, (1) money, (2) bank credits, and that the latter may be *four or five times as large as the former.*"

In many cases these "credits," which are incorrectly classed as "deposits" by the banks in their bookkeeping system, are much more than four or five times larger than the so-called money deposits; and furthermore, of the so-called money deposits, only a small fraction is likely to be gold, the balance being bank notes, checks and drafts of other banks. The proportion of gold or gold certificates in these so-called money deposits is almost negligible.

How do the banks manufacture these misnamed "deposits?" Incredible as it may seem to the uninitiated, the answer is, *by lending "money"!*

In my last article I pointed out that the vast "deposits" and "resources" could not possibly represent gold values, since they are many times in excess of the whole supply of gold in the United States. They are, in fact, simply disguised loans and discounts, of paper.

An examination of the balance sheet of any National Bank will show a startling relationship between the item of "deposits" on one side of the sheet and "loans and discounts" on the other. Paper deposits offset paper loans and discounts.

J. T. Holdsworth, himself a big banker in Pittsburgh, frankly states in an authoritative work on this subject:

> "The bank's loanable funds come mainly from deposits, *and deposits arise largely from loans.*"

D. H. Robertson in his recent book, "Money," describes the hocus-pocus in language which will be easily understood by the layman. He says:

> "Bank money originates in *loans* made by the banks to those who are engaged in productive enterprise. A farmer, for instance, who expects to harvest his wheat crop in a year's time, applies to the bank for a loan of $5,000 and the bank creates for him a checking account of $5,000. That is to say, it gives him the right to create bank money, as and when he requires it, up to the amount of $5,000. Within these limits the farmer draws checks (that is, creates bank money) in accordance with his requirements, for the hire of labor, the purchase of implements, and his own personal expenses. At the end of the 12 months he harvests and sells his wheat crop and repays his loan to the bank. Meanwhile, THE BANK CHARGES HIM INTEREST ON IT."

It should be noted that when the farmer or the manufacturer applies to the bank, it is *he* and not the bank which furnishes the *real credit* or security. If the farmer has no wheat planted, or if the manufacturer cannot show a financial statement embodying desirable assets, he will get no "loan" from the bank. Frequently he is required to give a note or a mortgage to guarantee his credit.

It is on the strength of his productive assets, then, that the farmer or the manufacturer is given the check book with the right to issue CREDIT MONEY within a prescribed limit. Yet he pays toll to the bank in the form of interest, for the privilege of doing business *on his own credit.*

The discount game is worked in much the same way. A certain retailer has good credit based on valuable assets, but lacks funds. He wishes to purchase an order of $1,000 worth of goods. He gives the manufacturer a note payable in 90 days with interest. The manufacturer cannot circulate the note as money. Therefore, he takes it to the bank, which "discounts" it, deducting a certain amount as "interest" for the use of the bank's "credit," and adding the balance to his checking account. On maturity of the note the bank then collects the face value plus regular interest. Here again, *the real credit is not furnished by the bank.* Such a note, being endorsed by the manufacturer, becomes so-called "double name" paper, guaranteed by the assets of both maker and endorser. *The bank contributes nothing to the value of the paper,* yet skims the cream from it, simply because the bank's paper has usurped the function of money. "Goods," says White, "can be bought and sold with it as readily as with money, since the checks drawn against these 'deposits' (credits on the books of the bank) are universally accepted."

Instead of the banks furnishing their "customers" with the means of carrying on business, *it is the credit of our farmers and manufacturers that enables the banks to stay in business and reap profits.* In other words, it is the *credit value* behind the checks, a credit value created by productive industry, that makes possible the banks' "resources" of nearly FIFTY BILLIONS OF DOLLARS.

Has No Assets of Its Own

THE bank has no productive assets of its own. The bank creates nothing—it produces nothing. It is a bookkeeping institution, essentially dependent in nature, and its dependence is the very element which is forcing public challenge of the authority which it has assumed. The servant and the dependent assuming mastery is a situation which calls at least for explanation.

If a farmer or a manufacturer possesses assets which entitle him to credit, why should he be at the mercy of and forced to pay toll to other private individuals for the right of using his own Credit? Money Masters are bad enough but Credit Masters are intolerable.

And so, recognizing bankers as *middlemen,* the questions arise as to how serviceable and how expensive they may be.

Since Credit has become the real Currency of the nation, and the issuance of Currency as a public utility is the province of the government, the farmer and the manufacturer should be provided with free facilities for liquidizing their credit.

The annual interest charge, which both the government and productive industry are paying for the privilege of doing business on their own credit, is already mounting to staggering proportions.

In my last article I showed that the Federal government, the state, county, and municipal governments, school districts, and other political units, are already in hock to the tune of more than *thirty billions of dollars.*

The extent to which agriculture and industry are in hock to the financial monopolists can hardly be computed. It has been predicted that within a comparatively short time the entire annual income of the nation will be absorbed in the payment of INTEREST CHARGES, and this is fast reducing government, business and people alike to a condition of economic slavery, not only in the present, but for all time to come through the operation of so-called bond issues extending over long periods of time.

The Federal Reserve Act, notwithstanding the loud talk by its sponsors about "stabilizing credit" and "liquidizing our national finances," was in more senses than one a "gold brick" handed to the people. Its real purpose was to bolster up the gold standard for the benefit of the big banks by pooling their gold supply. It provided a fire department for Wall Street.

Monetized gold is at the bottom of all of Europe's present distressing woes. Stripped of her gold, the international bankers insist that Europe shall continue to recognize the gold standard and pay impossible debts on a gold basis; and thus far no European government has had the wisdom and the courage to supplant the non-existent gold by a modern system of Credit Money backed by the physical wealth of the nation.

This fact was brilliantly set forth in a recent article by the distinguished Italian historian, Ferrero, entitled "Gold Is Dead."

Polygamy, slavery, the booze and drug traffic, commercialized prostitution, monetized gold and war have formed connecting links in the formidable chain with which humanity has been bound to the dark and bloody past. All of these links but the last two—gold and war—have been broken at last, and nothing will aid so potently to abolish war as the dethronement of gold, which has been the most fruitful cause of war throughout the history of the world.

Washington Observations

By "OBSERVER"

COAL is certain to be a burning and blazing issue at the next session of Congress. It is said that the ills of the coal industry cannot be cured by legislation. But that is a convenient argument that is always put forward by the opponents of any reform. The people have been robbed, swindled and frozen by those who control Nature's reservoirs of coal in this country. The influence of the coal operators and the coal-carrying railroads with Congress has been very powerful. It is thought by observers that they will be far less able to continue the control of the next Congress than any they have yet encountered.

There are three important things relating to coal that the next Congress is certain to attempt to settle: First, there shall be a *sufficient supply* of coal made available for the people; second, that the coal shall be sold at a *reasonable price;* third, that the coal shall be of *good quality* that can be used and not contain a large percentage of impurities which has lately made coal of little value as fuel. The greatest swindle is in forcing people to pay the highest prices for the poorest quality. *The proposed legislation to regulate coal will deal with the quality of coal sold.* Several state legislatures are dealing with this serious question at this year's sessions. It will be one of the great domestic problems before the next Congress. Either the Department of Commerce or the Bureau of Mines will, undoubtedly, be authorized to fix or establish standards as to grades for coal.

The Bureau of Mines made a report, upon request of Senator Walsh, of Massachusetts, which shows that the people have paid exorbitant prices for anthracite and other coal that was unfit for use. Samples were analyzed and the results divided into three parts—clean coal, bone coal and slate. Most of the coal had from seven to 15 per cent slate. In other respects it averaged a very low grade of coal. Congress has provided the United States Coal Commission with $400,000 more to carry on the investigation. John Hays Hammond is said to be doing a very complete job of the work, as chairman of the Federal Coal Fact-Finding Commission.

An Aid to Coast Cities

SENATOR Caraway introduced a bill, a few days before Congress adjourned, which provides that any city, state, or political subdivision of a state can establish steamship lines of their own and have the ships the government owns as a gift. If this bill passes the next Congress all any city or state desiring to engage in the steamship business need do is to ask the government for the ships and any such municipalities or states will be made a present of what ships they need to establish a line, on certain conditions. This is certainly an opportunity that should be watched by cities and states bordering on the sea coasts that desire to build up great ports and a foreign trade.

Any municipality or state making application for ships to be allotted to it should address the application in duplicate, one copy to the Committee on Commerce, United States Senate, Washington, D. C., and another copy to the United States Shipping Board. Necessarily these applications will lay over until the next session of Congress takes up the measure.

The government, under the provisions of this bill, is authorized to allot and charter ships to the applicant city or state, for a period of five years, free of cost. After the steamship line has been operated for five years the government transfers title in the ships to the city or state operating the line, but a guaranty is to be given the government that the line will be continued for three years longer. It is thought that cities like Seattle, Tacoma, Portland, San Francisco, Los Angeles, San Diego, Galveston, Houston, Port Arthur, New Orleans, Mobile, Pensacola, Tampa, Jacksonville, Savannah, Charleston, Wilmington, Norfolk, Baltimore, Philadelphia, Newark, Jersey City, Hoboken, perhaps New York, New Haven, Providence, Fall River, New Bedford, Boston, Portland and some of the states in which these cities are located would be interested. In view of the Great Lakes-St. Lawrence Canal, and the wonderful cities on the Great Lakes, it is thought some of them might take advantage of this, in case the bill becomes a law at the next session. The number of the bill is S.4646.

G. O. P. Majority Cut

THE Sixty-seventh Congress passed into history at noon, Sunday, March 4. Unless there is some very great national or international crisis that would justify, in the judgment of the President, the calling of an extraordinary session of Congress during the recess, there will be no session of the Sixty-eighth Congress until the Constitutional date for the regular session, December 4, next.

The last session of Congress had a Republican majority in the House of 169, and in the Senate of 24. The next Congress will have a Republican majority in the House of 17, and in the Senate of eight. The new Congress, however, will have more independent Republican members than any other Congress, in the memory of observers here. The administration members, and the treadmill politicians, deplored the fact that so many of their number sent here under the Republican label, split up into groups or blocs, which made it impossible to handle many of them at the crack of the whip of the boss as in the "good old days." With President Harding's administration now half over, the great anxiety of the politicians in the harness at this time, is the fear that the forthcoming Congress will be far more independent of the political band wagon than even the last Congress.

Fifteen Hundred Always at Work

MOST people, including the newer members themselves, think that when Congress adjourns *sine die,* that the doors of the Capitol are locked, and that because the members are scattered to their homes in every state, there is nothing to do at the Capitol. As a matter of fact, the Capitol is a very busy place during the entire Congressional recess. The disbursing officers of the House and the Senate have about 1,500 men and women, including clerks and members, on their pay rolls.

To be sure, all legislative routine business stops with adjournment but it must be revived—*de novo*—in the new Congress. That is, each bill, no matter how near it may have come to be a law, must start all over again. Then there is a great deal of aftermath cleaning up on the outgoing Congress and preparing for the incoming one. Practically all members keep clerks at their offices constantly to keep in touch with matters before the many departments here that are of concern to their districts and their constituents. There has been no complete overhauling and renovation of the Senate and House office buildings since 1915. The furniture repair shop of the Capitol is already busy and Elliott Woods, superintendent of the Capitol Building, says that he has plans perfected for the general house cleaning—of carpets, walls, desks, filing cabinets, bookshelves, and so on.

In addition to the $7,500 a year of salary, each Senator and Congressman receives 20 cents a mile for traveling expenses. Members living in Maryland or Virginia only 50 miles from Washington receive $10 to bring them to the Capitol and back to their homes each session. The Michigan member living 700 miles away gets $140. The California, Oregon or Washington State member living 3,000 miles away gets $600. The Congressional delegate from Hawaii, living 5,000 miles away, gets $1,000 "mileage" for traveling expenses. Each Congressman is allowed $3,200 a year for clerk hire, and $120 for stationery. In addition the committee to which he has been assigned is furnished stationery. It was stated on the floor of the House during the last week of the session that several members had to borrow money to pay their obligations so they could go home. This was during the discussion of a proposed bill to increase salaries to $10,000.

The "Filled Milk" Crime

WHEN the "filled milk" bill was introduced in the Senate, and during the last week of the session while it was under discussion, there was a tendency to belittle its importance and to laugh at it. One would hear it spoken of as "a wild, western farm bloc proposition." After Senator Ladd, of North Dakota, made an elaborate explanation of his bill in his speech the attitude of the political treadmill Senators could not help but change. The bill was promptly passed, when put to a vote, immediately after Senator Ladd's speech.

Here is a prime article of food for people of all ages, but particularly for babies and children, that has been adulterated and its nutritive qualities taken away by heartless profiteers, and *swindlers in milk.* The scheme was, and no doubt it is still practiced, to *remove all the butter fat from the milk which sells for from 40 to 50 cents a pound and replace it with oriental cocoanut oil that costs only 8 to 10 cents a pound.* In appearance this doctored skimmed milk would be as perfect as a disguise could be. The purchasers of it supposed they were getting genuine and nutritious milk. There seems, however, to be some difference of opinion as to whether the cocoanut oil can be substituted after the milk is fresh from the cows, or has lost its natural heat. At any rate the swindle has been practiced for many years and the practice had become such a menace to the health of children, particularly, that 11 states had passed laws prohibiting the "filling" of milk. Now that Congress has passed the "filled milk" bill into law the next task is to enforce it. It is another score to the credit of the progressive Senators

Much Could Be Done to Aid Trade Commission

Federal Fair-play Body Often Has Hands Tied in Inquiry Work Because of Lack of Adequate Supporting Legislation

By HUSTON THOMPSON
MEMBER FEDERAL TRADE COMMISSION

The story of what the Federal Trade Commission is and why it is, was told by Mr. Huston Thompson in last week's issue of The Dearborn Independent, as preliminary to the question of the present needs of the commission, which are taken up by him in this, the second of two articles by the commissioner. Mr. Thompson desires it to be understood that the views here given are his own, and of course in no way binding upon the commission.

THE Federal Trade Commission does not require more powers but it should have the laws under which it acts clarified.

The commission has the power to step into the arena of business and stop one competitor from purchasing the capital stock of another, and thereby preventing competition. It can issue its order against a business interest where the same receives secret rebates from a manufacturer who is not giving such rebates to its competitors. It can, and does, stop false advertising, misbranding, and enjoins combinations from exercising unfair means by which they get control of commodities or exercise unfair discrimination in selling to those who distribute to the ultimate consumer.

I say it already has the power under the act to do this. But the commission's order when disputed is necessarily delayed a long time before it is finally made operative by the courts. In the interim, a competitor may be put out of existence by his stronger opponent through the unfair practice. The decision is too late to benefit the corpse.

Relief Comes Too Late

IN ONE instance, for example, a group of about 275 retail grocers combined into a co-operative buying association to purchase direct from the manufacturers. The wholesalers in that district joined together with the brokers who were deprived of their profit because of this direct buying on the part of the "co-operative," and conspired against the "co-operative" by threatening the manufacturers with various penalties if they did not discontinue selling to the co-operative. This case was fought bitterly, but the commission issued its order against the wholesalers and jobbers. The order was appealed from, and the case was taken to the United States Circuit Court of Appeals. Finally this court sustained the commission as to a number of those charged with conspiracy.

A long time had elapsed, however, and by the time the decision was rendered the co-operative, unable to keep going because of the condition which confronted it, had passed into insolvency and gone out of existence.

Cases of this kind come repeatedly to the commission and it is urged to hasten them not only by the smaller concerns who are threatened with extinction but also by larger ones who are threatened with serious injury through the acts of a competitor. However, there are so many of them that they have to await their turn owing to the limited number of lawyers in the commission.

It is obvious, if the commission's work is to be effective, that an offender should, when an order has been issued, be required to appeal to the circuit court of appeals within a reasonable time which ordinarily might be a period of 30 days, and in the event that the commission's order is sustained by the court, then the circuit court might require the party to give a bond to pay a reasonable amount of money for every day that it continued the practice after the issuance of the commission's order. The amount should not be so great as to drive the one charged into submitting to the commission's order without appeal because of the fear that by any chance the order might be sustained, but it should be of sufficient size to protect the public and to make the respondent give due consideration to the whole situation.

Must Act Expeditiously

WHILE care in the investigation of cases is a great essential, nevertheless if protection is to be offered to the public and the business world, the commission must move in its work with expedition after an application for a complaint is presented to it.

The commission has another need, also in the interest of expedition. Under the rulings of the court, the commission can only investigate the charge which is set forth in the complaint. It repeatedly happens that the commission charges the defendant with the only ground that is known at the time of the issuance of the complaint. Subsequently, it develops that other unfair methods of competition have been practiced, or that the facts are different in some respects from what the commission discovered in its original investigation. Under the present rule, the commission, in such circumstances, is compelled practically to stop its proceeding, give great care to amending its complaint, serve it on the respondent and start all over again, all of which covers a loss of approximately 90 days.

If the commission is to keep up with the increasing number of cases that come to it, there must be some way found to overcome this delay. This can be done by permitting the commission to amend a complaint at any period prior to the closing of the testimony so as to cover other unfair methods that may have been discovered, or to meet the facts as shown by the testimony.

This will work no hardship since the commission offers its evidence to the one charged, and in the modern vernacular "lays all its cards on the table" before the latter produces any of its defense.

There is another way in which the commission's work can be greatly facilitated and made more effective and that is by clarifying the language which bounds or describes the field in which it exercises its powers. That description is composed of 11 words which are: "That unfair methods of competition in commerce are hereby declared unlawful." Within the boundary of those 11 words, the commission has the power, subject to review by the courts, to say what is fair or unfair.

But many of the most disastrous effects in the competitive world are produced by unfair "acts." The question has been raised as to whether an unfair act is equivalent to an unfair method. All unfair methods are certainly unfair acts, and while the courts seem to indicate that unfair acts are included under the phrase "unfair methods," the point has not been clearly defined. This might seem to be a difference between tweedle de and tweedle dum, but at any rate the commission to be effective should not have to stop on frequent occasions and go into a brown study as to whether an unfair act is an unfair method, but should be clearly given jurisdiction over unfair "acts" as well as "unfair methods." This could be done by simply adding the phrase "unfair acts" to the law as it now stands.

The commission has also been given jurisdiction over parts of what is known as the Clayton Act. One of these parts is found in section seven which says that:

"No corporation engaged in commerce shall acquire, directly or indirectly, the whole or any part of the stock or other share capital of another corporation engaged also in commerce, where the effect of such acquisition may be substantially to lessen competition between the corporation whose stock is so acquired and the corporation making the acquisition . . . . No corporation shall acquire, directly or indirectly, the whole or any part of the stock or other share capital of two or more corporations engaged in commerce" with like effect.

How Competition Is Ended

THE original purpose of Congress in enacting that part of the statute was to prevent corporations from acquiring competitors and thereby lessening competition and producing a condition that would tend toward monopoly.

A number of corporations have accomplished the same result by simply acquiring the physical assets, thereby circumventing the effect of this law. For the statute to become really effective in preventing monopoly, it should be amended so as to prohibit the purchase of the physical assets of a competing corporation when the effect is of a character within the ban of the present law.

In one of its investigations, the commission found a monopolistic control of an industry was possible under the terms of the court's dissolution decree. Under that decree the different units of the corporation were for legal purposes supposed to be strangers to each other; but there was an interlocking stock ownership in the different organizations which has perpetuated the very monopolistic control which the court sought to terminate.

The commission expressed the opinion that the situation could not be effectually remedied by existing laws, and suggested legislation which would forbid common stock ownership in corporations which have been members of a combination dissolved under the Sherman Act.

Cut Down Blue-sky Sales

TO MAKE the purpose expressed in this declaration apply to possible future combinations, that part of the Clayton Act having to do with prohibition of the purchase of stock of one company by a competitor could be amended to prohibit the common stock ownership in several companies which are doing business in a basic or necessary commodity where the companies otherwise under normal conditions would be competitors.

The Federal Trade Commission has been very active in the suppression of false representation in the promotion and sale of blue sky securities in interstate commerce. It has had a considerable potential effect and has stopped some of the largest operators in this field of fraud. However, owing to the magnitude of this unfair business, the number of people operating in it and the geographical territory involved, it is impossible for the commission effectually to cover the field under its present law

The methods applied in the sale of stock, ignorance on the part of the public and the impossibility of getting the facts has hopelessly handicapped the average buyer as against the seller and for this reason the responsibility should be placed upon the seller of giving the buyer every opportunity to know what values are behind the stock, how much the commissions and bonuses are, to whom they are going, and the amount that is actually to be expended in the business. To do this, it should be made mandatory upon all those who are selling securities in interstate commerce to file with the commission or some other official body the necessary information, and in the event that they fail to do so or make false statements be subject to criminal penalty. They should further be compelled to carry a brief but comprehensive statement of these facts in all advertising, circular or other means of communicating their desire to sell their securities. In this way much of the intentional fraud would be stopped through fear of the penalty for falsifying on the part of the criminally minded. A great many of the statements of those who do not intend to defraud, but are ignorant of the statements which they are making, would be prevented, and the commission could undoubtedly, with this amendment to its powers, eliminate to a great degree this present source of loss to our working and farming classes.

Greater Staff Urged

IN ITS brief life, the commission has investigated 2,938 applications for complaints charging unfair methods of competition. It has issued 921 complaints and 479 orders, and has more than 250 cases now in the process of trial, or awaiting trial. It has also dismissed 217 cases either for failure of proof or because it did not think that the public welfare was sufficiently involved. The work of the commission is continually expanding both through decisions of the courts and because Congress is calling upon it with greater frequency to make investigations and recommendations to it.

The business interests of the country are seeking its aid with increasing frequency. Some of the cases awaiting trial involve as important questions as have yet come up for solution in America. The parties involved are represented by the leaders of the American bar while the commission has a trial force of but 21 lawyers. Unless it is to become ineffective its staff will have to be enlarged to meet the requirements put upon it by Congress and the business world.

During the war, the commission had 780 employes, and an appropriation of $1,677,540. Shortly after the Armistice was signed, it cut the number of its employes down to 364, and its appropriation has been gradually reduced until it is now $905,000.

Should the courts decide that the commission has the power, which under the Constitution Congress intended it should have, of making current monthly reports on production cost and prices of the basic commodities of life throughout the United States so as to stop fluctuation markets, over-supply, and buyers' strikes, and have data prepared in the event of labor troubles to submit for a basis of conciliation, it will need at least $1,500,000 a year to meet such a situation, in addition to its constantly increasing docket of cases and its special investigations ordered by Congress.

Many Hopeful Signs

THESE are the essential needs of the commission as I see them at the present time. What of the future? Will they meet and solve what by many is asserted to be the greatest social problem of our time—the absorption of our political and economic philosophy by an engulfing mercantilism? The merchantilists of the seventeenth and eighteenth centuries believed that national welfare rested primarily on industrial prosperity. Accordingly they endeavored to foster and promote industry to the neglect of agriculture. They sought to accomplish this through laws, regulations and restrictions of all kinds, with the practical result that industry, trade and commerce were throttled. Then the reaction set in. The importance of agriculture was again recognized. Adam Smith became the prophet of individual liberty and economic progress.

I believe the commission can stop this drift and be to our practical business world what Adam Smith was to the world of theory of his time. It can bring freedom to the many through the regulation of the few who are unfair.

There are many hopeful signs on the horizon. One is the sound, wise interpretation of its law by our Supreme Court, another the splendid support given the commission's efforts by the farmer, toiler and housekeeper. Still another is the appreciation that business has of the value of a good name with the consumer, and finally the determined effort of some in every industry not only to keep within the law but to insist on their belief that each man or corporation in the market place should stand or fall by his own industry, foresight and skill and not through combinations in which the consumer is left out of consideration

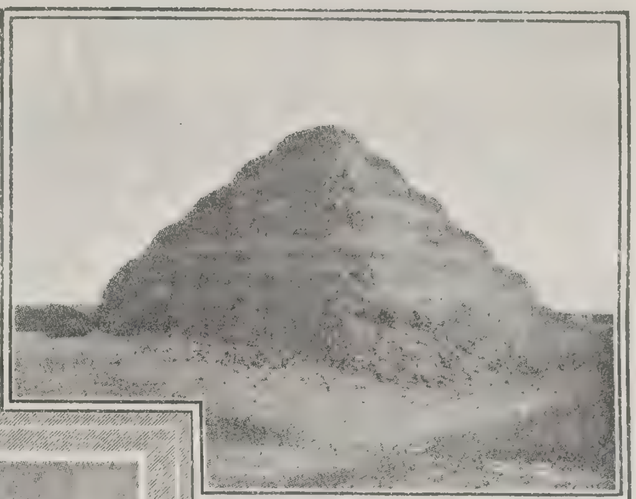
International Science Briefs

By DR. ARVID REUTERDAHL
President, Ramsey Institute of Technology, St. Paul, Minnesota

Imhotep—the World's First Stone Architect

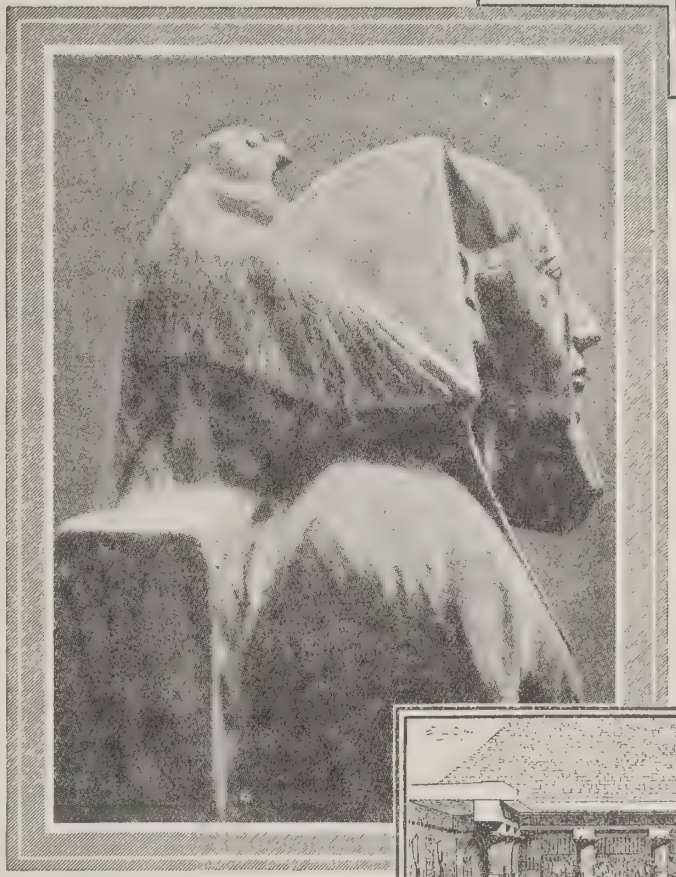
ONE of America's foremost architects, Dr. Ralph Adams Cram, tells us in his fascinating books how we can discover the culture and civilization of nations through their architecture. To the initiated, the mute and silent structures of antiquity never cease to radiate the thoughts and ideals of their builders. Recent archeological research has brought to light many interesting facts concerning Ancient Egypt and its great builders.

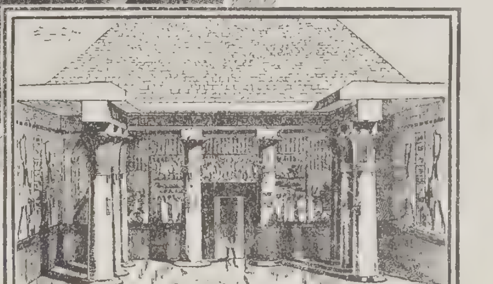
Between the years 4000 and 3000 B. C. the Nile Country was the scene of a marvelous transformation from a great game preserve, with here and there a town, into the first organized state. It is a noteworthy fact that the advent of Egyptian civilization is chiseled in its stupendous monuments to the dead. The thought of death strongly influenced Egyptian life. Our knowledge concerning Egyptian antiquity is almost wholly derived from the mute stories told by the tombs. Diodorus tells us that the Egyptians considered the houses of the living as inns, and the tombs of the dead as eternal habitations. Before the year 4000 B. C. the only type of burial used by the Egyptians was the pit grave. This consisted of a low mound of sand which in some cases was surrounded by a circle of stones. The mound grave was the forerunner of the stone masonry pyramid.



The tomb of Pharaoh Zoser. Designed and built by Imhotep.

The first stone masonry structure known at the present time is a wall built by the Egyptians about the year 3100 B. C. Antiquity can boast of no period of development and use of material resources equal to the thirtieth century B. C. in Egypt. It was this century which brought forward the great Egyptian architect and engineer Imhotep. Before the thirtieth century Egyptian builders used sun-dried brick as building material. It was Imhotep, the greatest architect of ancient times, that definitely introduced stone as a building material. To this great builder was intrusted the task of designing and building the tomb of Pharoah Zoser at Sakkara, Egypt. Imhotep boldly departed from the then prevalent theories of construction and conceived the tomb of Pharaoh Zoser as a huge terraced pyramidal structure of stone 200 feet high. The tomb of Pharaoh Zoser is the earliest stone superstructure known to man. The execution of Imhotep's great conception involved the solution of many engineering and mechanical problems. The raw material must be properly quarried and transported to the site of the structure. The principle of the wedge was applied by Imhotep in conjunction with the principle of expansion in splitting off the great stones which he used in the construction of the tomb of Zoser. Along cleavage lines a series of wedges were driven into the exposed surface of the quarry. These wedges were then moistened thoroughly with water and allowed to expand with the result that huge blocks were split off from the rock strata. Wooden sledges served as transportation means for conveying the stone blocks to the building site. Imhotep used the inclined plane in order to carry building material upward as the work of construction progressed. These temporary inclined planes or ramps were built adjacent to the permanent construction work. Sun-dried brick was used in the construction of these ramps. Wooden sledges loaded with the building material were dragged, by main strength, up these inclined planes. From recent evidence brought to light by Egyptologists it appears that a crude form of the simple pulley-block was used by Imhotep in lifting the huge stone blocks from the sledge to the desired position in the pyramid structure. Another device employed by Imhotep was the wooden rocker. Two rockers cut like segments of a circle and joined by wooden cross-bars constituted the Imhotep rocker. An enormous stone block placed upon the rocker could be raised through a distance equal to the maximum tilt of the rocker. By repeating the operation huge stone blocks weighing 2.5 tons were elevated, by slow stages, to suitable positions in the structure after being first hauled to the top horizontal surface of the construction ramps. The labor was enormous but in the time of the Pharaohs labor was the cheapest of all commodities. That the construction engineers who composed Imhotep's engineering staff were familiar with the principles of surveying is everywhere apparent in the work. The Egyptian engineers could run a straight line over, under, and around obstacles with surprising precision for hundreds of miles.

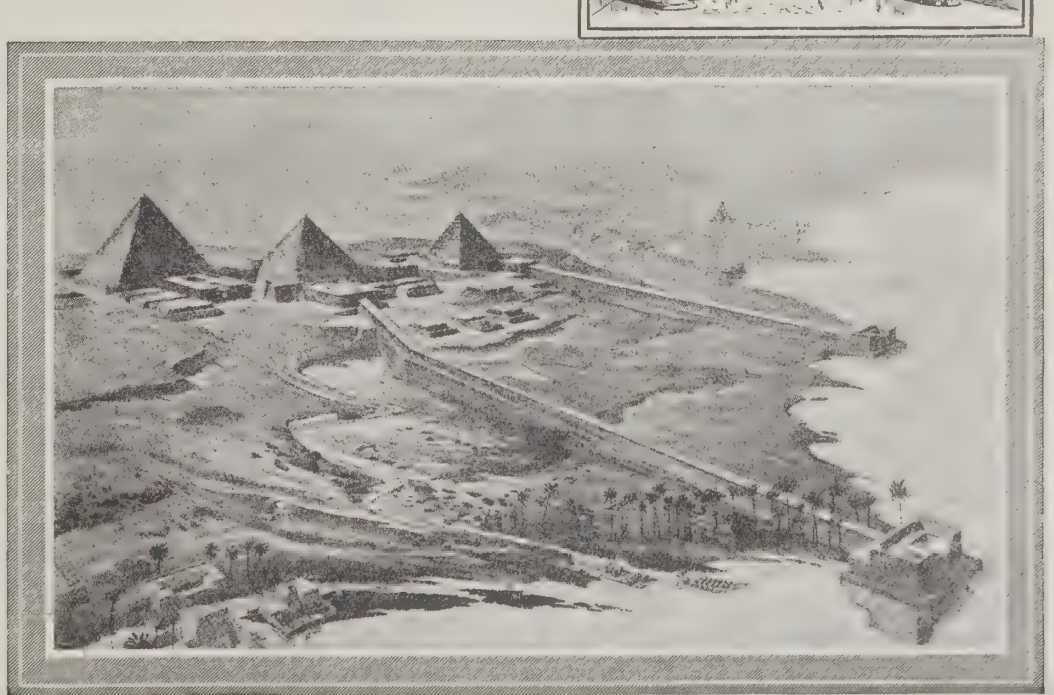




Above—Pharaoh Khafre.
At right—Borchardt's restoration of the Colonnaded Court of the Pyramid Temple of Sahure.

It is unfortunate that Egyptologists have not, as yet, discovered any traces of the surveying instruments which were used by the engineers of ancient Egypt.

Imhotep ushered in the great Age of the Pyramids which lasted from about 3000 B. C. to about 2500 B. C. This first great civilized age, in a large measure, owes its advent to the architectural and engineering genius of Imhotep. In the twenty-ninth century B. C. the engineers of Pharaoh Khufu built the Great Pyramid of Gizeh. This great tomb required 2,300,000 limestone blocks weighing about 2.5 tons each for its completion. About 100,000 men labored upon this structure during a period of about 20 years. The Great Pyramid of Gizeh is almost 500 feet high. Pharaoh Khafre built the Second Pyramid of Gizeh. New and fundamental engineering problems were solved by the engineers of Khafre in the construction of the accessory structures. At Abusir the pyramid engineers (2750 B. C. to about 2600 B. C.) developed the first columns and colonnades known in the history of architecture.



Borchardt's restoration of the Pyramid Cemetery at Abusir.

Imhotep in addition to his achievements as an architect and engineer won fame as the greatest physician of the thirtieth century B. C. It is not strange, in view of his versatility and extraordinary genius, that the deification of Imhotep, by the priests of ancient Egypt, followed soon after his death.

An Indian in the Punjab writes in ink in Arabic a verse from the Koran on a grain of polished rice. The verse is written by the projected and polished finger nail of the writer and the Arabic characters are so beautifully traced that one may read them with the naked eye. The artist, a middle-aged man, has been doing this kind of work for years.

The Waldes Museum in Prague is a button museum founded by a Bohemian button manufacturer. It is devoted to a collection of dress-fastening devices of all kinds and of all periods.

Exciting motion pictures and plays cause the temperatures of audiences to rise and result in the throwing off of bodily heat. Some theaters lower the heat supply as the act approaches the climax.

Boa constrictors are the latest fashionable pets for women in London and Paris. The snakes are caught on the shores of the Amazon and placed in perforated zinc boxes fitted with tanks. American bull snakes are very popular also.

The waters of the Columbia River often rise 40 feet, reaching the maximum from the fifteenth to the last of June. The river flows about six miles an hour on an average.

Tons of fish were smothered in Glenmore Lake, Orange County, New York, by the ice which covered the lake two feet thick from shore to shore. When the community found the water supply objectionable they investigated and when a hole was cut through the ice thousands of dead fish came to the surface together with many live fish in search of air.

All big-game hunters in Alberta will in future be forced to wear clothing consisting of some white material. The high mortality rate among careless hunters makes this necessary.

The tenants at Hampton Bishop, Herefordshire, England, pay their rent with stakes. This is a practice that has been followed since old feudal days of centuries past. Each householder must gather each year six horse loads of stakes from Hay Wood. The stakes are used for penning sheep at the Hereford fair.

An oil purifier, built on the same principle as a cream separator, takes the dirt out of used oil, much as a cream separator takes the cream from milk.

One side of a vein of the Keeley Mine at Cobalt, Ontario, is plated with a sheet of pure silver, from a quarter inch to an inch thick. This sterling silver is 12 feet long and is exposed for a height of eight feet, and may be higher. It is estimated that eight hours and $25 worth of dynamite will blow out $100,000 worth of silver—five tons of solid silver.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Bees have hived in the head of the Henry Clay statue in the cemetery at Lexington, Kentucky.

Dr. Charles W. Eliot, president emeritus of Harvard University, says, "The prime object of democracy is and ought to be increasing freedom, independence, comfort and exemption from fear for all sorts and conditions of men, but this object cannot be attained until the poverty due to political institutions or social customs has been abolished."

German marks and Russian rubles are being sold as souvenirs on the streets of many of our larger cities.

An electric motor will soon replace the bell ringers of Notre Dame, the famous Paris cathedral. Because of the high wages demanded by the ringers it has been decided to introduce modern appliances. The last of a long line of head ringers, who from father to son for generations carried on the work, is now compiling a written manual for the guidance in the future of the electrical ringing of the bells.

Children patients at the Niantic, Connecticut, tuberculosis sanitarium go practically naked the year around. Nothing so quickly destroys the tubercle bacilli as the rays of the sun.

To save the village of Oberammergau from starvation, the famous Passion Players of that place are going to the United States, not to put on the Passion Play, but to present an elaborate act showing Bavarian villagers at their wood-carving craft. All receipts, minus expenses, will be used for charity work in the village of Oberammergau. The players will permit a film of their act to be made, the proceeds going to charity.

The Canadian federal government has purchased a large farm near Guelph, Ontario, to put returned soldiers on the land.

Dean Hammond, of Cornell University, deplores the invasion of Tutankhamen's tomb. How would Americans like it, he asks, if the Saracens 3,000 years hence broke into George Washington's tomb at Mount Vernon and if the bones of Abraham Lincoln were carried off to Constantinople and placed on display in a Saracen museum?

Bentonite, commonly known as soapstone, is found in extensive deposits in Alberta. It has not been developed commercially as yet.

Sweetened condensed milk, diluted with hot water, has won a place as a highly esteemed drink among the Chinese of the Swatow district. They prefer this mixture to the excellent fresh milk, containing a high percentage of butter fat, available from the water buffaloes and other cattle maintained in considerable numbers by the farmers.

The first known log house, built by white men within the bounds of what is now Colorado, was erected in 1816, for a troop of Spanish cavalry patrolling the Arkansas, near the site of Pueblo.

Several skeletons of prehistoric beings estimated to be from 1,000 to 1,500 years old have been unearthed in the Ozarks region of Missouri. These people were cliff dwellers but they should not be confused with the cliff dwellers who lived high up on the faces of cliffs in Arizona and New Mexico. Many crude weapons and implements were found perfectly preserved in the dry soil under the overhanging cliffs.

In a volcanic crater in the Sangro de Cristo Mountains in San Isabel National Forest is an apparently bottomless pit, with black marble sides, in which depth soundings of 1,500 feet have failed to touch bottom.

Northwestern University wants "he men" and not "she men," according to the president of the athletic association. Men and girls will not be permitted to sit together at future basketball games, because the fellows pay no attention to the sport. Students who escort their young women friends to a basketball game will be "bawled out" by cheer leaders with megaphones.

PROPAGANDA OR FACTS?

The world today is flooded with propaganda. There is a scarcity of facts. Pick up a magazine or newspaper and glance through it. Aside from local news—how much dependable information do you find?
That is why Henry Ford established

The Dearborn Independent—The Ford International Weekly

A non-partisan, non-sectarian weekly magazine, devoted to printing facts—a chronicler of the neglected truth.

CHRONICLER OF THE NEGLECTED TRUTH

Watered Housing: How Home Buyer Is Cheated

Organizations Formed to Aid in Financing People of Small Means Charge Exorbitant Rates and Their Profits Are Huge

By AARON HARDY ULM

TWO years ago in an eastern city, where the housing situation coming over from the war was acute, leading real estate men and bankers took steps to evolve a process of relief.

"The chief trouble," they said, "is in the financing of homes which people with small funds want to buy."

Moved it would seem—or so they themselves claimed rather clamorously—by desire to help solve a difficult community problem, they organized a mortgage and trust company for financing the sales of homes, chiefly of the small and moderate-sized sort.

The company has operated for two years. Its promoters claim, with no little apparent ground in fact, that it has contributed considerably toward "relieving" the house shortage in the community where it operates.

During the first six months of its operations, the company handled capital funds amounting to $204,482.93. At the end of the half-year period, its officers reported total earnings of $25,834.90, or at the rate of about 25 per cent a year on capital. After all taxes were paid, net earnings amounted to $18,557.58, or at the rate of nearly 20 per cent a year. At the present time, the company's officers claim that earnings are at the rate of between 25 and 30 per cent a year on capital funds now amounting to about $2,000,000.

Rather profitable benevolence!

Not an Isolated Case

THE operations of this company would be of no particular importance, from a national point of view, were they merely an isolated instance of tremendous profits being taken by mere money as a result of the acute housing situation and the consequent building boom throughout the country during the last several years.

But one of the company's officers—a man of wide and long experience in that kind of financing operations—tells the writer that there are approximately 1,000 such companies in the United States. In a single large city of the East there are more than 30. In each of two mid-western cities there are more than 50. The aggregate capital of these companies totals in the hundreds of millions of dollars. They are able, as will be shown, to use considerably more funds than is represented by capital paid in for stock.

They are what are generally known as second mortgage investment companies. Though they deal to some extent in first mortgages and some perhaps deal in commercial paper, their business consists chiefly of buying what is known as second mortgage real estate notes.

In addition to these incorporated companies, there are a large number of individuals throughout the country who make a business of similar investment operations, which are carried on by individuals very much in the same way as by the companies. They make no public reports of operations, the full nature of which are not even disclosed by the records that cover transfers of and mortgages on real estate.

Generally speaking, they never erect or sell a house or other piece of real estate. They rarely ever make a loan directly to purchasers of homes, as do the first mortgage concerns and the building and loan associations. Yet they hold home purchasers' obligations totaling in the hundreds of millions of dollars.

The amount of such obligations now held by these investment companies and by individuals who also "bought" them has increased vastly in recent years. This is chiefly because of the enhanced sales values of real estate, particularly of the residential kind, and the unusual activity in real estate operations.

It is probable that all those outstanding in the country as a whole total in face value not less than four or five billions of dollars. If so, they contain probably not less than one billion dollars of "water"; that is, of value which was tacked on on the score of "risk," but which ultimately will have to be redeemed in real money by the persons who owe these obligations or by occupants of property covered by them.

Second Mortgage Used

BETWEEN three and four billion dollars' worth of residential building—homes and apartment houses—has been done since the war. The "financing" of most of it involves the use of the second mortgage or some method tantamount to it. The second mortgage rarely covers less than one-third of the full sales or rental value. This would mean that there are outstanding against new residential construction done since the war not less than one billion dollars' worth of second mortgage "paper" of the type dealt in by investors and investing companies of the kind here discussed. Estimating the average rate of discount at which this "paper" was taken over by the third parties which usually hold it, at only 15 per cent, the "water" thus injected, by this one element of "financing," into new housing during the last few years would amount to not less than $150,000,000—to be taken, over and above good interest rates, by mere money.

The average discount rate very probably has been higher than 15 per cent. There are many known cases of its having been as much as 50 per cent. Cases of that kind were disclosed in New York.

Second mortgage note discounting has figured in sales of old as well as new property. It has affected the renting values of old apartment houses as well as those of new ones. In fact, it has accelerated inflation tendencies in all city real estate in practically all the country.

Sometimes equally as radical discounting has been applied to "construction loans" and first mortgages.

At the unemployment conference two years ago, a committee that studied the construction problem reported, as fairly typical, a case where the "financing" of a new apartment house in a certain eastern city entailed an outlay amounting to more than 20 per cent of the total expenditures. The construction loan costs 18½ per cent, over and above regular interest charges. A subsequent loan of $250,000 cost $75,000 or 30 per cent.

"It is doubtful," said the committee in its report, "whether the margins received by the architect, the contractor, and by all producers of the basic industries involved aggregated a sum equivalent to these financing charges."

The committee was headed by General R. C. Marshall, Jr., directing official of the Associated General Contractors of America.

If such could happen to operators big enough to attempt the erection of a large apartment house, what do you suppose may happen to the small builder who erects homes for sale, or to the purchaser of those homes?

In the case of the purchaser of a home on terms of a moderate cash payment down, the assumption of a first mortgage and the signing of monthly notes, backed by a second mortgage, for the balance, much worse has often happened. However, with him it is a painless process. Apparently he pays five to seven per cent interest on the first mortgage and six to eight per cent on the second. Ostensibly he pays a great deal more on both; certainly so, if the financing is done in the usual way.

Service Charge Is Made

IN THE first place, a commission or service charge is paid for the first mortgage. An eastern builder tells the writer that in his section this cost has doubled since pre-war days. He used to get first mortgages at a cost of one and one-half per cent; now they cost him an average of three per cent. In 1913 he would have paid about $37.50 for a $2,500 first mortgage on a house he built to sell for $5,000. Now he would place a $6,000 mortgage on the same kind of house. This costs him $180 or more. Then when he gets what cash he can out of the purchaser, usually about $1,000, he takes the purchase money notes to an investment company or an individual "note shaver" and sells them on the best terms he can get. At the lowest he must discount them 10 per cent, usually it is more, frequently much more, depending upon a variety of circumstances. This loss the builder must anticipate and include, as he does the cost of the first mortgage, in the price he charges the buyer. The total amount of discount on the score of an average new house that would have sold for $5,000 in 1913 has been in recent years anywhere from $500 to $2,000, depending upon many and widely varying conditions. In 1913 it would not have been more than $200 or $300 in the average city.

This is one of the chief reasons houses have been selling at prices far in advance of the increased cost of materials and labor entering into their construction.

According to figures published by the United States Department of Commerce the average new house that would have sold for $5,000 in 1913 should have sold in the average city of the country, at any time between July, 1921, and February, 1923, at from about $8,850 to $9,900; that is to say, if nothing but increased cost of materials and labor had been connoted by the advance in price. The land usually cost more than 10 years ago but at best the land is but a 10 to 20 per cent cost factor in the average item of residential property.

But the $5,000 house of 1913 has been selling for the last two years at from $11,000 to $14,000. In fact, unless the observations of this writer and several experienced real estate operators are at fault, such houses have been selling for considerably more than in 1920 when construction costs, as reported by builders in 60 cities, were from 30 to 70 points higher than in the latter part of 1921 and nearly all of 1922.

In truth, only for brief periods since the war have average construction costs been more than twice the 1913 average. From July, 1921, until March, 1923, they averaged much less than double during all of the time, the index number ranging from 165 to 197. On March 1, this year, it passed 200 for the first time in nearly two years.

On the sales prices of new housing, as compared with the 1913 level, there are no exact figures; a long and scientific investigation would be necessary to develop them. This is because many abstruse factors, changes in the style and appurtenances of houses, subtle differences in the character of construction, and others, enter into the problem. Nobody, so far as the writer can find, has made any attempt to develop exact facts bearing upon it.

But old houses have been selling in most cities for more than twice what they were or could have been bought for in 1913. Rents generally also have more than doubled for the types of living abodes that measure up to new construction. This would not be so if new property could be procured for less.

Inflation, of course, has saturated virtually every phase of real estate and building operations. Dominant factors in the materials industries have tried to combat it. The National Lumber Manufacturers' Association repeatedly has reminded its members that high profits taken easily by virtue of inflation always cost the lumber industry much more than it makes by them. The Associated General Builders of America, the largest of builders organizations, recently warned its members that continued inflation of values will result inevitably in a slump that will demoralize the construction trades.

Many real estate operators who are builders, too, recognize the danger in loading housing down with "water," and have protested against it.

Labor, too, builders tell the writer, has been somewhat unjustly accused on the score of premeditated extortion.

"In most cases," he says, "of seemingly notorious exactions on the part of labor in the building trades, the fault has been with the builder or the promoter. In order to finish construction as quickly as possible and make sure of selling at boom prices, 'scaffold climbing' has been a regular practice. That is, employers have been climbing the scaffolds on the jobs of others and offering workmen large bonuses to shift the scene of their activities. They have paid excessively for overtime work and have accepted almost any kind of work the mechanic would deliver. These practices have 'watered' construction costs, but little blame for it attaches to the workmen."

No Losses, He Concedes

BUT one class of contributors to the processes of building inflation has not, as a class, so far as can be found, either admitted the faults of inflation or made any strenuous efforts to combat it. It is the "note shaving" class. This can be easily understood, for the greater the inflation the greater the volume of "paper" to be "shaved" and the higher the discount rates at which it can be procured. And only in the endurance of inflated values can they look for absolute safety for their investments. The uncertainty of the continuance of those values is the justification they give for the exorbitant levies made by them on the credits underwritten.

Yet the past would indicate that the "note shavers" take no great risks. An eastern operator who has erected and sold thousands of houses and "finances" his own second mortgage paper tells the writer that not long ago he surveyed his purchase money notes record for a period of five years. During that period he lost exactly $6.75.

"I know a record better than that," said the officer of a second mortgage investment company. "There is a mid-Western organization that has been buying second mortgage notes for 20 years and has never lost a dollar through failure to collect on them. Personally, as an investor and considering the element of safety only, I would rather have purchase money notes on residential property than first mortgages."

What $600 Has Earned

WHILE the investment companies, as a rule, exact discounts lower than those usually imposed by individual "note shavers" the organized concerns are more conservative as to quality of "paper" purchased. The report of one of them on 40 transactions in second mortgage notes lies before the writer. Those notes amount to $120,000. The prices for which the property behind them sold aggregated $268,843.52 over and above both first and second mortgage obligations. Those notes are paid in monthly installments and the last one falls due within three years of the date they were issued. They were purchased at a discount of 15 per cent and bear interest at the rate of seven per cent. By the time they are paid off, those who owe them will have paid approximately $50,000 for the credit covered by those notes. The company nets more than 15 per cent a year on the transaction; on the actual money involved in the transaction the company nets more than 30 per cent a year. For after purchasing the notes, the investment company could take them to a regular bank and use them as collateral in borrowing $75,000 or more at six per cent interest, which $75,000 it could use in buying more notes to be borrowed on at the banks in similar way.

No wonder they earn huge profits. From the stock-selling literature of one of them, the writer finds a statement of earnings made by seven older concerns of similar character.

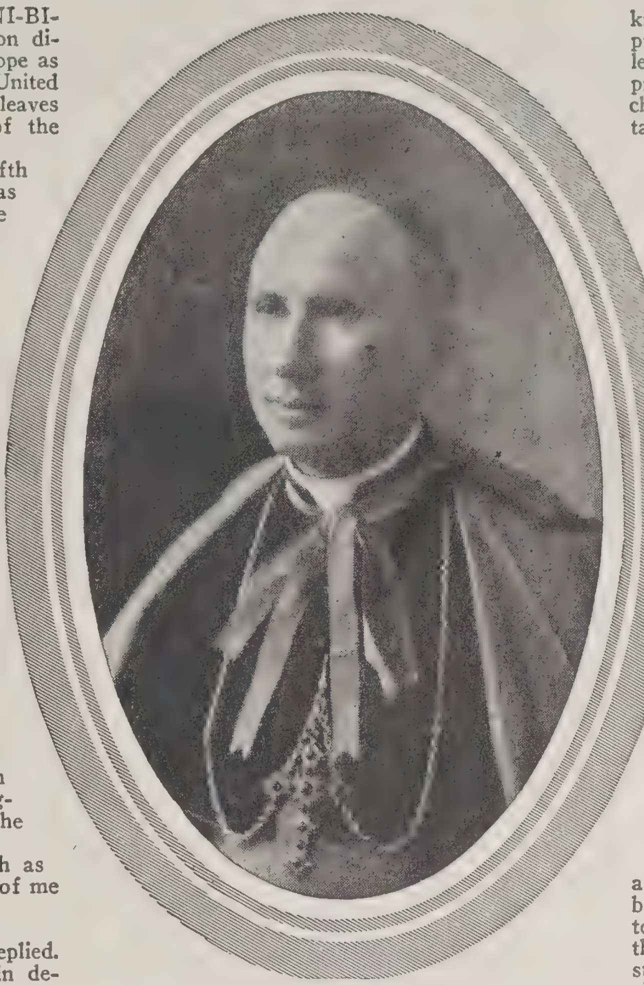
The sum of $600 originally put in the stock of the one that heads the list has earned to date $31,665. The same amount handled by the second one has earned $28,680. The seventh has doubled every $600 of original funds used by it by more than five times!

Remember that there are an estimated 1,000 of similar incorporated concerns in the United States and probably several times that number of individual investors who operate along similar lines—all taking their toll, in the main, from residential property in cities—

(Concluded on page 15)

The Catholic Church's Relation to America

Papal Delegate Tells of Mission—By JAMES MARTIN MILLER



ARCHBISHOP FUMASONI-BIONDI,

New papal delegate to the United States.

ARCHBISHOP PIETRO FUMASONI-BIONDI has just arrived in Washington direct from Rome. Appointed by the Pope as the apostolic or papal delegate in the United States, he succeeds Cardinal Bonzano, who leaves Washington for other diplomatic fields of the Catholic church not yet designated.

Archbishop Fumasoni-Biondi is the fifth representative since the papal legation was established in Washington. The first one was Cardinal Satolli, during the last Cleveland administration. Then came Cardinal Martinelli, Cardinal Falcona, and Cardinal Bonzano, in the order named.

I called upon the Pope's representative in the United States, at the new palatial papal legation in Biltmore street, just off Columbia Road. Here I met one who is unmistakably a born and trained diplomat. He receives with great cordiality. Dressed in the robes of his high rank, he discussed the spiritual condition of the world, and of his Church in particular. He converses in all the principal languages, even in Japanese, and one or two of the many dialects of India. He has served as papal delegate to both Japan and India.

His almost faultless English is tinged with the soft and musical Italian, for Italy is his native country. Such a man, speaking our language without the corruptions, without the slang and the short cuts we practice in America, almost makes us ashamed of misuse of our mother tongue. He has a staff as large as that of any foreign embassy or legation represented in Washington. Monsignor Cossio is auditor of the apostolic legation.

The archbishop interviewed me as much as I did him. In fact, he had a little the start of me when he asked:

"Are you a Catholic or non-Catholic?"

"I am a non-Catholic, your Grace," I replied.

In answer to a question he was exact in defining the boundaries of his stewardship in the United States:

"My territory, you know, includes not only the United States, but also the islands of the Pacific, the Hawaiian Islands and Guam. The Philippine Islands, Cuba and Porto Rico are not included in my territory. Each of these countries has a delegate sent specially to it. There are 10,000,000 Catholics in the Philippines.

"How many Catholics, and again how many Christians, are there in the United States, your Grace?" he was asked.

"There are 23,000,000 Catholics in the United States, exclusive of the Philippines and Porto Rico, and 24,000,000 members of other denominations. It is appalling to think that in this great Christian nation, there are some 60,000,000 of people without God, so far as we know!

"I have read a great deal about the declining church attendance in the United States. Apparently it has grown to be a serious matter with many denominations. Your United States census report for 1920 produces figures indicating that for each Catholic edifice in the United States, there was an average attendance, each Sunday for the census period of 10 years, of a little over 900 persons. In all other denominations, there was an average attendance, each Sunday for the same period, of 66 persons, for each edifice.

"I read that the authorities of several denominations in the United States give as a reason for the decreased attendance at church in recent years the many modern distractions that have arisen—the movie, the automobile, and Sunday amusements. However much these have affected other churches they have not adversely influenced the attendance at the Catholic churches, as an examination of the statistics on this subject will show. If these distractions do not cause a loss of interest in the Catholic church, why should they do so, as their own authorities point out, in other denominations?" asked his Grace.

"How much growth, or progress, has the Catholic church made in the United States during the past 10 years, your Grace?"

"Oh, I cannot tell you, no one knows that, but if you will ask me how much progress we have made since the United States was a nation, or during the past century or more, I can tell you that we have made a marvelous growth. We count growth by centuries, not by decades," said he.

"Your priests own property in their own names, do they not, your Grace?"

"There seems to be a great misunderstanding among many people about that. There are two kinds of priests in general terms. The parish priest is the secular priest. He comes more or less in contact with the world, of necessity. The priests, or fathers in the great orders of the church, are the regular priests. The secular priests take two vows, that of chastity and obedience; obedience to their Bishop and the Pope. They do not take the vow of poverty. But the regular priests, whom the world rarely sees, take three vows; of chastity, obedience and poverty. They cannot own even a car fare or the clothes on their backs. When they need a car fare, or a stamp, or anything, they ask their father superior and he supplies their wants. There are about 90 orders of men, and about 120 orders of women in the United States. They are not of the world and the people know little about them. But their influence, within the church and out of it, is very great.

"There is no discipline in all the world so severe and so strict as that practiced by many of the Catholic orders," continued the archbishop. "If it requires constant and faithful discipline and practice to be a good military man, or a perfect musician, it requires more of these to be a good Christian. No man or woman can go along life's pathway safely for themselves, and for society in general, without God and Christ."

"Your Grace, is there more, or less, spirituality in the world since the war than before it?"

"While it is true the war created a deplorable situation I feel there is more spirituality in evidence among the people than before the war. Take for instance, Benito Mussolini, now premier of Italy. He had strayed away from God and the church before the war, but during the last year of the war he came back to God, who directed him and made Mussolini the power that he is. Many in France and Italy strayed away before the war but have returned since."

"Your Grace, how many countries of the world had ambassadors accredited to the Pope before the World War and how many since?"

"France discontinued diplomatic relations with the Vatican in 1903, or 11 years before the war. In 1914 when the war broke out France at once sent an ambassador to Rome accredited to the Pope. Germany, which had none previous to the war, sent one immediately when it started. So did Great Britain. These embassies remain and without doubt will continue. Before the war Great Britain had none, you may recall. There are now more than 30 countries of the world having two groups of diplomatic representatives at Rome; one group accredited to the king of Italy and the other to the Pope. Before the war started I think there were only about 10 nations with representatives to the Vatican.

"Japan, China, Turkey, Sweden, Norway, Denmark and the United States are, practically speaking, the only countries in the world that do not send diplomatic representatives to the Pope. The Pope sends to each of these countries, and to countries like Canada, Australia and South Africa, papal delegates, as I am here."

"You are not, then, your Grace, an accredited political or, rather, temporal representative, of the Pope in the United States?"

"No, I am simply the representative of the Pope in the spiritual affairs of the church. There is no exchange of diplomatic representatives between your government and the Vatican.

"I am particularly pleased in being in the United States," said the archbishop as he accompanied me to the door. He paused, then added: "The ideals of your Constitution and our constitution are the same."

As the representative of his holiness, the Pope, in the United States, His Excellency, Archbishop Fumasoni-Biondi, with emphasis, made it plain that his mission is spiritual for the welfare of the 23,000,000 souls, whose titular head he is, in the biggest "diocese" in the world.

Lasker Again

IT MAY have been by request, it may have been shame, but whatever the cause the newspapers have avoided including the name of Albert D. Lasker among the President's companions on his Florida trip. Washington knew that Lasker would be a member of the party, and Mr. Harding's friends threw up their hands in despair as they have done more and more of recent months. "In God's name what power has Lasker over Harding?" exclaimed one of the latter's friends. The spectacle of a President of the United States jumping into the Ship Bonus fray whenever Lasker cracked the whip, and taking a beating for his pains, was most humiliating to Americans. Lasker, whose career would make the most interesting sort of reading, without reticence and with all the delicacy of an advance man for a circus, haunts the White House, is with the President socially and officially and has made himself official chaperon for the White House family.

But everyone sung low on Lasker's going to Florida. The President's choice of intimates is not high to begin with, but it was thought that for appearances' sake Lasker might be left off the list. However, he went. But never a mention of his name. It would be interesting to know how that silence was secured. Mr. Lasker, of course, as head of a great advertising agency and the dispenser of millions of dollars' worth of advertising annually (some of it the government's!) is in a position to request and enforce silence. Anyway he secured it, and he did not see it broken until sensationally he dashed back to Washington bearing with him President Harding's consent and commission to go ahead on another shipping bill!

It would have been impossible, of course, for Lasker to have retained silence on that. And so we are to have it all over again—a Lasker bill favorable to the host of Lasker's waiting friends, and the President of the United States in Lasker's retinue of celebrities to put it through.

Surely of all the Court Jews that appear in the record of European kings none ever was able to make such a spectacle of his sovereign as is this most amazing White House Jew.

The Sugar Conspiracy

THE recent advance of 50 per cent or more in the retail price of sugars is the result of a conspiracy that amply warranted the announced investigation by the government. As usual, the independent press of the country has "scooped" the dailies in calling attention to the matter, but at last the newspapers are stirring after the steal has in part been completed. The people of the United States were robbed of $25,000,000 in six weeks and the dispatches intimate that it will be no surprise if refined sugar attains an altitude of 20 cents a pound.

In an interview on February 21, but a few days after the first advance in price, Earl D. Babst, president of the American Sugar Refining Company, warned against a recurrence of the conditions of 1920, his statement being all that is needed to prove that *manipulation*, not necessity, is responsible for what has occurred and what is to occur. He said:

"I returned today from Cuba after an annual visit. The sudden jump in the price of raw sugar naturally is very gratifying to the Cuban people and will be very helpful to them in their undeserved reverses. It, however, mystifies them not a little. The weather in Cuba is fine and the crop is moving rapidly.

"The supply of sugar in the United States, according to our weekly canvass, is ample. We have on our books practically a 30 days' business for our customers and have raw sugar to operate all of our refineries at capacity for that period. The one thing, however, that we, as refiners, cannot provide against is a stampede either in the trade or among consumers. Such unthinking action only plays into the hands of speculators and the public puts up sugar prices on itself unnecessarily. These facts are given to the public in an effort to forestall even a start of conditions which led to the over-buying of 1920.

"Sugar statisticians, whether government or private, should remember that they have only part of the facts. It is their office simply to record statistics. When they comment on their statistics or prophesy, they then step out of their office and do so with grave risk to the public. The present speculation on the New York Sugar Exchange is greatly to be deprecated. Those who foster it and those who follow it are introducing a gambling element into a food necessity, which in my judgment should be left entirely to the law of supply and demand."

How seriously is viewed the government's part in this matter is indicated by the fact that many are now calling attention to the misleading reports issued by Mr. Hoover's department. The Department of Commerce, using Mr. Hoover's all-too-much-used name, said that a sugar shortage impended, that the year would call for an increase of 725,000 tons of sugar with only an increase of 125,000 tons in sight. This operated just as the Hoover coal fiasco operated: when there was more coal above ground than there had been in years, Mr. Hoover's department slapped on its stupid discriminatory order which was exactly the thing that the coal profiteers and coal bootleggers wanted. This gentry profited by conditions created by the Hoover fuel control. Likewise, the report of Hoover's department seems to have suggested the rise in sugar price.

The sugar report of the Department of Commerce was unfounded. It isn't the only unfounded report that has been issued from that quarter. But it just happens that this time it touched something that could be checked up.

The only lack of confidence felt in the forthcoming investigation is that Secretary Hoover will have part in it. His record for efficiency, courage and correct information is not reassuring.

Price of Wheat on the Farm

A STRIKING contrast in the expense to the wheat growers of Western Canada and their neighbors across the line in the United States in getting their product to the seaboard is presented by the *Wheat Growers' Journal* of March 15.

The outlet for the Canadian grower is Fort William, while his American colleague ships either to Duluth or Chicago. These points are practically equi-distant from the seaboard, so any difference in net price at the farm must be caused by a difference in transportation cost to the Great Lakes.

The most striking comparison made by the *Journal* is the case of the freight rates from Sweetgrass, Montana, and Coults, Alberta, towns but 10 miles apart. The Canadian Pacific carries a car of wheat from Coults to Fort William, a distance of 1,203 miles, at the rate of 27½ cents a hundred pounds. For the same service from Sweetgrass to Duluth, 1,004 miles, the Great Northern charges 43 cents. Tariff barriers prevent the American from utilizing the cheaper route, and it might easily occur that two farmers whose lands joined at the international boundary net different prices on the farm, with a difference of 15½ cents a hundred in favor of the Canadian.

The strange part of the story is that the Canadian feels his rate is too high.

Other comparisons made by the *Journal*, which we compress into shipping points and distance, are: Lander, Wyoming, 1,275 miles, 69 cents; Ashland, Wisconsin, 527 miles, 28 cents, exactly the rate from Passburg, Alberta, for 1,259 miles; Hutchinson, Kansas, 741 miles, 36½ cents, compared with Calgary, Alberta, 1,243 miles for 26 cents.

One railroad man thought the lower rate obtaining in Canada was because the roads had been taken over by the government, but it was pointed out to him that the Canadian Pacific was one of the most prosperous of North American rails, its stock selling at 150. Another ventured the view that the tariff tax levied by this country on Canadian wheat made the Alberta farmer sell at a lower price, but went no further when told that grain for export is not dutiable, and if it were, could avoid the rail transportation from Buffalo by reaching the seaboard in Canadian waters all the way.

There is just one cause for the difference, and that is, rail rates in this country are too high.

We Wonder If They Know

DID you ever read the names of the men who form the majority of committees in the organizations that crowd thickly in the neighborhood of New York and Washington? It would not be exaggeration to say that at least 50 men in this country are wholly unaware of the number of committee lists which are adorned by their names. It is said of a New York resident who is by courtesy referred to as a clergyman that he would need a dray to carry all the committee lists on which his name is found. Being a "liberal," which nowadays means nothing definite at all except possibly a more or less shady attitude toward constitutional Americanism, his membership, of course, is in all those societies which amaze the country by their financial lavishness, their outspoken contempt for American institutions as thus far developed, and their hand-in-hand attitude toward all sorts of internationalists. And with him, of course, are other men to whom certain organization objects have been explained in most alluring terms.

We wonder if these committee members, these patrons and sponsors always know the exact purpose to which they lend their names? And we wonder if there would not be a wholesale revision of scores of lists if they knew?

And the humbler membership of organizations—we wonder if they know what they are supporting? The term "supporting" is used in the sense of social support, for certain questionable organizations do not press their membership for money, they have it in plenty from concealed sources. There is, for example, a widespread woman's organization in the United States which goes back to one woman, behind whom stands a man seldom heard of. People who are "in the know" always refer to that organization of hundreds of thousands of American women as "————'s crowd." Mr. ———— just happens to be a Jew, and is in most respects an admirable man. The point is that this multitude of American women don't know the inside facts of the society which their names and presence and prestige support.

This herding of the people into easily handled groups, on the strength of alluring "statements of purpose" which as printed command the approval of all decent minds, has reached such proportions in America that it is time, and past time, for someone to make inquiries as to what it means and why these hidden sponsors pour out money to keep the people herded.

It is time for the common membership of organizations to begin an investigation and run it clear through to the top. It were better for the members to do this than for an outsider.

Americans, in their good nature, have been bundled into so many packages, that one can take a trip to Washington and New York and meet 20 persons who claim to pull the strings which mold millions of minds and control the actions of whole sections of our people.

It is a good spring exercise to push through the question: "What actually is this thing to which I have given my name?"

That Revised Version

A COMMENT in these columns some weeks ago on the subject of a copyrighted Bible was not complete in its statements of the situation. To copyright the Bible, to make the text a commercial possession and the sale thereof a commercial monopoly, smites all the traditional views that have been held regarding the freedom of the Scriptures.

In the case of the American Revised Version, however, certain circumstances have entered which have made this in a way unavoidable. For three decades a group of scholars labored in the work of revision, and when their work was completed it was found impossible to secure a publisher who would assume the risk of issuing a new version of the Bible without guaranties which would justify the necessarily large initial expenditure. The present publishers took up the responsibility under a copyright which should operate to protect their investment not only, but also insure the purity of the text. That is to say, the purpose of the copyright was not to create a Bible monopoly, and it does not operate to prevent public use of the text, it being understood that the Sunday school publications, and others which use the copyrighted text, do so without payment.

Efforts are now being made to create a society which shall hold the American Revised Version in trust, thus eliminating what may appear like a special commercial interest in Bible production. The comment in these columns has had the happy effect of bringing these facts to a wider public notice.

Mr. Ford's Page

SEVERAL weeks ago there was discussed on this page the value of beginning a business right. Several statements were made on the practical side, of which these two are probably worth more definite discussion: First, that a small beginning enables a business to make those improvements which experience always makes desirable; second, that stockholders are inevitably a drag on service, a brake on the character of the business—that is, of course, absentee and non-productive stockholders.

In a country where the benefits of stockholding are so eloquently extolled, it is not easy for everyone to see just where the stockholder becomes a hindrance to the fullest development of *business as service.* And the initial difficulty is that we have not been accustomed to think of business as service; business has been an approved way of *getting money* and the money meant something again that had no reference to business as *service.* It is rather strange to think that what a business "made" was money.

The other day three working men were eating their noonday lunch when a passer-by asked one of them, "What do you make a day?" The man stopped munching his food long enough to say, "I make two thousand bolts a day." That man had a true political economy. He made two thousand bolts a day, and the bolts "made" him $7 a day, but the main thing was the service rendered society by the bolts, and the sign of that service was the money that came back to the man.

What does a business make a year? The answer is almost certain to be in terms of money rather than in terms of useful commodities. That is the difficulty of discussing business in terms of service—people are not accustomed to it. And yet it is just this fundamental principle that is at the basis of the whole problem of stockholders.

It is very noticeable of late years how the big corporations have been using their stockholders as a defense against the public demands for service. This is especially true of those corporations whose products are so necessary to the public that they have really become public utilities. There are a number of private concerns whose products are so indispensable to life that they are really part of the social organization. The public at least has felt this and has exerted pressure to increase the quality of service. And then, to parry the public demand, the corporations have pleaded their duties to their stockholders. It is now a favorite method to advertise the large number of stockholders whom a corporation pleads that it must serve with dividends, and if any considerable percentage of these people be widows and orphans, the plea is the more pathetic.

The public, of course, is thus misled. Dependent on sources of information which he cannot check up, the average citizen is misled constantly. For example, he is not told *why* so many plain people came to be stockholders in concerns which now complain that they cannot give service and pay dividends, too. He is not told that the financiers who once owned all the stock deliberately sucked the business dry of all possible profits for half a century to come and then, using their great financial names as bait, unloaded the stock on a lot of unsuspecting people who had been inoculated with the virus of getting something for nothing. It has been a long, sad story, but it has taught a lesson, and that lesson is being learned.

And now that those people are in, their only interest is dividends. Did you ever see an absentee stockholder who was proud of anything in a business except its power to produce dividends? Did you ever hear a man refer to his "stock" in terms of shop production or of service to the community?

A BUSINESS that is at the mercy of any competitor is a business that has stopped growing. A business that is growing in volume and not in quality is also in danger. And this happens mostly to businesses that started big. It is a great disadvantage to start big, because then you are too big to change and revise and improve as your experience grows. A business that begins at its natural beginning and grows through merit and industry is supple, it is easily able to adapt itself to the very valuable discoveries of experience. It always leaves an open end for new progress, always keeps a place where the new can link hands with the old for greater service. There is safety in small beginnings and there is unlimited capital in the experience gained by growing.

A young man starting business may need partners, he may need helpers, he does not need stockholders. The only ground he has for thinking that he needs stockholders is his notion that he must start as big as he can. If a man would follow his own instincts, if he would sit down quietly and let the present and the future arrange themselves sanely and clearly before his mind, his own ordinary sense would tell him that there was something wrong, something not quite businesslike in starting a business by loading it with debt the very first thing.

Because, for one thing, money paid for stock does not produce. Nothing produces but the minds and hands of men. When a man has an idea he has what is necessary to demonstrate the idea, because an idea gathers to itself what it needs. And then if a man needs help in production, the idea gathers to him like-minded men who are willing to throw in their lot with his, and together venture on the idea. This is not a stock company; it is a working, producing organization. If you will look at the history of the successful concerns that have started as stock companies, you will see that it was not the stock that accounted for their success. Stock can never create success, it can only tax success.

One disadvantage of stockholders to the business beginner—a disadvantage little thought of but very important—is that it cheats him out of the valuable experience of growing. One of the big assets of any business is the education it received in growing from a small beginning. The automobile business was fortunate in this, it seemed so unlikely to the wise financial men of a quarter of a century ago that it had to begin at the beginning. Suppose large sums of money had been sunk in the early models and great factories built to produce those models (which would have been necessary under the stockholding system), it is awful to think what would have been the status of the industry today! Progress would have been impossible.

But the successful motor makers began in little shops with few helpers, and they learned. Their business was small enough so that they could profit by what they learned. Their equipment was small enough so that they could adapt themselves to the requirements of progress. They were able to grow.

Now a business that starts big is not able to grow; it is committed to a certain form, a certain style, a certain quality of product and there it must remain. Why are very helpful inventions pigeonholed in great industries? Because to adopt the inventions would mean a complete revision of those industries, and they have become too big to grow. Growth would break them. They are "set," fixed forever, or until some little fellow who was willing to begin in a small way grows up and passes them.

The tragedy of a big business, that exists solely to produce dividends and not to produce the very best article in its line, is its inflexibility. There are big businesses that have made no provision for growth at all, nor for improvement. A slight improvement on the article which they manufacture would require far-reaching changes and cut deeply into the money consecrated to dividends.

This situation, however, would not develop in a business which had begun at the beginning and grown by sheer merit and industry, because in the experience of growing this business would have learned that there must be kept an open end for more development and ever more development and that the article produced must develop so naturally and harmoniously that even the new thing can be used with the old. The managers of such a business would naturally learn that lesson, but how could it be learned by the managers of a business that started big?

It is very important for young men of industry, integrity and merit to learn these fundamental lessons.

A volume of 346 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Federal Court Flouted in Cronkhite Case

Two Men Are Indicted for Murder, the Jew Walks Free, the Non-Jew Held in Jail for Trial

By CHARLES ALBERT COLLMAN

TWO men were arrested last October as fugitives from justice. Bench warrants had been issued against them from the United States Court for the Western District of Washington, charging them with wilful and premeditated murder. The two men had been indicted on the same counts and for the same crime. Their cases, therefore, were identical. It is the province of this chapter on the Cronkhite case to show from official court records how the administration of Federal justice was *different* in the state of New York from that in the state of Rhode Island.

When Rolland R. Pothier was arrested in Providence, Rhode Island, bail was refused him, and he was placed in prison, where he has since remained.

When Robert Rosenbluth was apprehended in New York City, wealthy men identified with a racial organization, the American Jewish Committee, went to his support, and he was immediately released on bail.

The two men now were to be extradited to the state of Washington, to plead to the indictments. No question of their guilt or innocence was considered in these purely "removal proceedings."

In Rhode Island, Pothier's case was properly laid before the United States District Court. The Federal judge decided that the bench warrant against the prisoner had been issued by a court of competent jurisdiction, and granted a warrant for Pothier's removal to Washington.

In New York City, Rosenbluth's case was not laid before the United States Court, nor before any "judicial" body whatever. It was presented for adjudication to a United States commissioner, who acts as an amanuensis, or in a ministerial or clerical capacity for the district court, to assist it in routine transactions of bail and other minor matters. After much hesitation, and many protests that he should not have been called upon to take the responsibility for this important decision, and asserting that his opinion could not be considered as final, the commissioner discharged Rosenbluth's bail and *dismissed the proceedings against him.*

Today Pothier languishes in a Rhode Island jail.

Rosenbluth walks the streets in freedom. Although charged with murder by the United States, he is in a position to snap his fingers at the indictment which still points its accusing finger at him from the Pacific Coast.

How is it possible that the laws of the United States Government are interpreted differently in New York City than they are in the state of Rhode Island?

Readers of THE DEARBORN INDEPENDENT will recall that in the first chapter on the Rosenbluth-Cronkhite case, published on December 30, 1922, the following statement was made: *The heads of a powerful and country-wide organization, the American Jewish Committee, or New York Kehillah, have intervened in the legal proceedings. This organization will undoubtedly prove its supreme test of power if it accomplishes its efforts to nullify the acts of public officers and destroy the functioning of one of the greatest departments of the United States Government.*

Nearly 100 American citizens have knowledge in their possession concerning the mysterious death of a United States Army officer, whom two men, wearing that army's uniform, are charged with having murdered. These men have sworn to the facts in their knowledge before a body of other citizens, forming the Federal Grand Jury in Tacoma, Washington. The latter, after weighing the evidence, found the indictment for murder against the two accused. But the indictment would not have been effective until it was returned to a United States judge, seated in open court. It then became a Federal indictment, because the grand jury is an arm of the court—its most important arm. Those who try to frustrate the legitimate progress of this court's action are enemies to the government.

Federal Judge E. E. Cushman, to whom this presentment was made, assured the jurors that "the court feels that this jury is entitled to the thanks of the public for the services performed." He issued the bench warrants for the arrest of Pothier and Rosenbluth, and *gave instructions that the men, when apprehended, should not be admitted to bail.*

To date, no military court, no United States court, no judicial body whatever has had opportunity to pass upon the merits of the case against the men charged with the premeditated murder of Major Alexander P. Cronkhite. The witnesses above mentioned have never been heard outside the inviolate walls of the grand jury room. For two years, however, desperate efforts have been made to prevent their testimony from being heard.

The proceedings so far initiated have merely been for the extradition of the men from the Federal districts in which they were found, to the state of Washington, to plead to the indictments. As said before, no question of their guilt or innocence has ever entered into the hearings so far held. That question can be determined only in the United States District Court for the Western District of Washington.

How Removal Proceedings Were Conducted Against Rolland R. Pothier in Providence, Rhode Island

HEARINGS on the removal to Tacoma of Rolland R. Pothier, jointly indicted with Robert Rosenbluth for the murder of Major Cronkhite, were conducted in the post office building, Providence, Rhode Island, before *a United States district judge,* Arthur L. Brown.

The same government witnesses appeared at this hearing as at the one held in New York City in Rosenbluth's case. At the New York hearing the arguments against the validity of government jurisdiction were presented by Louis Marshall, head of the Jewish Committee.

Judge Brown rendered the following decision, which is *the only judicial opinion yet rendered in the Rosenbluth-Cronkhite case.* **This decision was suppressed by the newspapers of New York City, because at one blow it destroyed the Rosenbluth propaganda which those newspapers have been fostering.**

In Re
Rolland R. Pothier } (Certified)

District Court of the United
States District of Rhode Island
Misc. No. 3270

Petition of Norman S. Case,
United States Attorney,
for Warrant of Removal.

OPINION
January 11, 1923.

BROWN, J. "This is a petition by the United States Attorney for this district for a warrant for removal of Rolland R. Pothier to the Southern Division of the Western District of Washington, pursuant to the provisions of Section 1014, Rev. Stats. (Sec. 1674 Comp. Stats. 1916) for trial upon an indictment returned in the District Court of the United States for that district, charging that said Rolland R. Pothier, on about the 25th day of October, A. D., 1918, "within and on lands theretofore acquired for the exclusive use of the United States, and within the exclusive jurisdiction thereof, and within the Southern Division of the Western District of Washington, to wit, within and on the Camp Lewis Military Reservation," and so on, did feloniously kill and murder one Alexander P. Cronkhite.

"The main objection to granting the warrant is that the Federal Court of the District to which removal is sought has no jurisdiction.

"While it is true that in order to establish the crime against the United States it must appear that the place of its commission was 'territory within the exclusive jurisdiction of the United States,' yet the District Court where the indictment is pending has full jurisdiction to try and determine this fact, as well as other allegations of the indictment. The denial of this allegation as to the place of commission does not raise a question properly of the jurisdiction of the trial court, but goes to the merits, raising the question whether the act charged was a violation of Federal Law. Louie v. United States, 254 U. S. 548. In view of this late decision of the Supreme Court it is unnecessary to cite the earlier cases in which this distinction was pointed out.

"Though the evidence presented at the hearing seems to have been relied

(Concluded on page 11)

How Removal Proceedings Were Conducted Against Robert Rosenbluth in New York City

SEVERAL months were consumed in the government's attempt to obtain the removal of Robert Rosenbluth from New York City to Tacoma, Washington, where he eventually must plead to the indictment found against him for murder. Rosenbluth had been liberated on bail furnished by Felix M. Warburg and Herbert H. Lehman, Wall Street bankers, and executive officers of the American Jewish Committee.

The hearings in the removal proceedings were held in Room 314 of the Federal Building, before United States Commissioner Samuel M. Hitchcock. The assistant United States attorneys charged with the duty of extraditing Rosenbluth were Samson Selig and Abraham Solomon. The prisoner's removal was opposed by Louis Marshall, president of the American Jewish Committee, and Jonah J. Goldstein, of the law firm of Goldstein & Goldstein.

From the beginning it was evident that extraordinary efforts were being made to prevent Rosenbluth from being brought to trial, and having the testimony against him heard. The government's action was opposed by the introduction of every technicality known to law.

Major Cronkhite had met his death at the Camp Lewis military reservation on October 25, 1918, at a time when this country was at war, and while he was in the act of training men for over-sea service. It is the obligation of the government to protect the lives of its officers while in the performance of their duty, both in peace and war.

Pierce County, Washington, had donated the land occupied by the Camp Lewis reservation to the United States Government. Lieutenant Colonel William Taylor, judge advocate, U. S. A., had stated it as his opinion that: "I confidently believe that the United States courts had or have exclusive jurisdiction of every criminal offense committed on the Camp Lewis military reservation or camp site since July 1, 1918." Thomas P. Revell, United States Attorney, Seattle, Washington, had testified: "We submit that as soon as Pierce County obtained the legal title in the condemnation proceedings that title passed to the United States. It was the intention of the legislature to get that title to the United States as soon as it could, and there was no reason for deferring the transfer after Pierce County had obtained it." Colonel Francis G. Caffey, United States Attorney for the Southern District of New York, had written to the United States Attorney-General: "It is perfectly evident, as always contended, that the jurisdiction in this case must be judicially determined in the jurisdiction where the crime was committed." It has been seen that these opinions were sustained by the high authority of the United States District Court, District of Rhode Island, the first and only judicial decision as yet handed down in the case.

Rosenbluth's lawyers, however, argued at the removal hearings, *that the government had no jurisdiction over the Camp Lewis reservation,* and that the case should be in the hands of the state authorities of Washington. Now the state authority in that instance would be one J. W. Selden, prosecuting attorney for Pierce County, Washington, who had never had the complete evidence in his hands, had never heard the many witnesses in the case, and admittedly knew little about it,

There's Real Paving in Antofagasta—a Surprise to Traveler in Chile

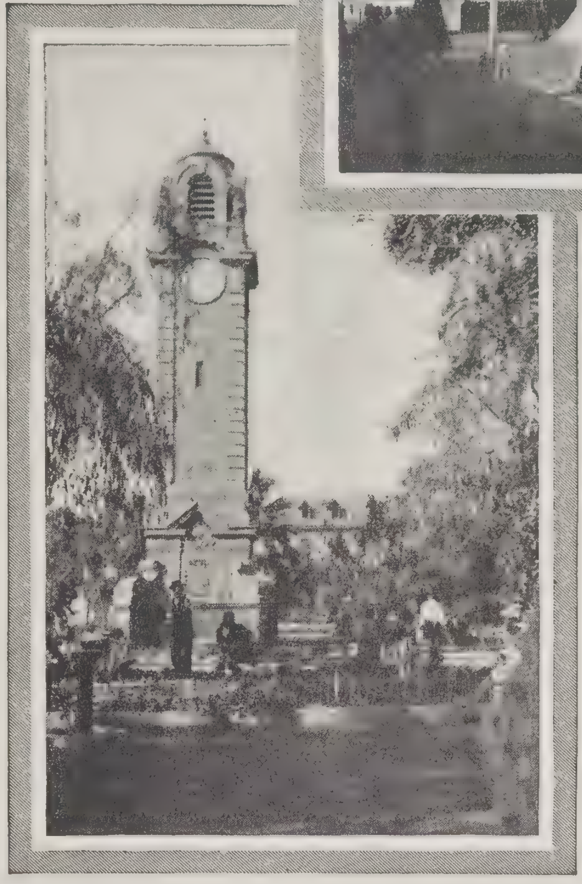
Nitrates Play Part in South American Industrial Activity

By CARROLL K. MICHENER

This is the fourth of a series of travel stories by Mr. Michener.

PELUQUERIA

In the heart of Antofagasta's retail district.



Clock tower erected by the British colony in Antofagasta's principal plaza.

A SCOTCHMAN, named George Smith, is more or less responsible for Antofagasta. It is a grave responsibility, for, beyond the first Sunday, Antofagasta is more deadly than any Gopher Prairie. To George is credited the discovery of the Chilean nitrate fields, which burst somewhat vaguely into the headlines of North American newspapers not so long ago in connection with the dispute over Tacna and Arica.

Mr. Smith cultivated a garden of fruits and flowers in a place called Pica, which is near the present port of Iquiqui. He banked his plants with soil containing a mysterious white substance common to the neighboring deserts, and beheld them grow almost with the rapidity of Jack's beanstalk. The tale ran its course to the bourses of England, and it was not long before the great inland plains of Chile and Bolivia were swarming with Indian laborers, blasting and hacking out whole square miles of the pampa subsoil.

Chileans hint that even the Inca farmers, long before Pizarro arrived, understood the miraculous properties of this desert substance, known locally as caliche; but no matter which legend gains ultimate acceptance, it is at least a pleasing fancy to associate Chile's great fertilizer industry of today with Mr. Smith's Pica roses.

Prior to the time these posies blossomed and faded there was very little excuse for Antofagasta. It was then merely a seaport for the very negligible foreign trade of Bolivia, and for some of the interior copper mines. Now it is, next to Iquiqui, the greatest nitrate port in the world, bristling with wharves, general offices and international banks. Once upon a time it was within Bolivian territory, but that unfortunate three-cornered quarrel between Bolivia, Peru and Chile toward the end of the last century left all the rich nitrate provinces in Chile's hands. Hence the Tacna-Arica dispute of yesterday's headlines.

In at least one respect, Antofagasta is different from some of the Gopher Prairies and from most of the mountain cities of Chile, Bolivia and Peru. When the extremely narrow-gauge train that had hurried us through the night, past the dismal nitrate and borax fields and down the last of the bleak foothills of the western Cordilleras, drew up at daybreak before a neat, cement-laid station, we were snatched away in a taxicab that did not jounce over such cobblestones as those of La Paz—sharp enough to rasp even the inured hoofs of the Bolivian llamas—but rolled smoothly and without rattle over an asphalt pavement

Of this symbol of wealth and modernity we had been forewarned by our train companion, the young Yankee drummer, who had spent most of the previous day lecturing some elderly Chileans on the superiority of North American business methods.

"Say," said he irrelevantly, in response to our inquiry concerning the Antofagasta hotels, "that's *some town*. They've got real paving down there!"

It was as well, perhaps, that he evaded the subject of hotels, for our temporary ignorance of them enabled us to enjoy Antofagasta so much the more on that brief taxi ride over ecstatic asphalt.

At the recommendation of Sancho, our "gentleman chambermaid," the Sunday afternoon of our arrival was spent at the Antofagasta Sporting Club. Deprived of bull fighting, the Chilean's gaming temperament finds its most dramatic gratification in horse racing. He by no means neglects the lotteries and all greater and smaller institutions of chance, but his sporting disposition is roused to its most poignant pitch in the grand stands and before the betting stalls of a *club hipico*.

Getting to the race course developed one of our many linguistic adventures. Translating a North American idiom into grammatically flawless classroom Spanish, we made an elaborate diplomatic arrangement with a taxi driver for round-trip transportation.

"Si, Señor," he assured us, confident of his understanding. "Go and come back. *Claro.*"

Carrying out the terms of the covenant as he thus comprehended them, this *hombre* had driven us there and part of the way back before we realized what was happening. Not having recognized as such the ramshackle board fence that afterward proved to be the race course inclosure, we felt somewhat in the position of the lad who sat all day on the Wishing Gate and then came home because he could not find it.

The Englishman, following the lead of George Smith, has played a large part in the development of Chile's nitrate industry. We were by no means surprised, therefore, at the liberal seasoning of English surnames in the directory of club officers. Equally conspicuous on the race cards was the Anglo-Saxon christening of some of the horses. Rover-White, Afterglow, Daring, Tommy and Rick tripped the tongues of Chileans who encouraged them from the stands or called out before the racing stalls for tickets bearing their numbers. They competed with such favorite local nominatives as El Inca, Mariposa, Mercader, Vengador, Copayapu and Quien de Pilla.

Betting was on the pari-mutuel plan, and for uncommonly small stakes. This enabled a garlicky crowd of many castes to struggle for tickets at the betting wickets. The unaccountable human hysteria that seizes on a group of persons leaving a theater or boarding a street car, and impels each one of them to attempt the impossible feat of getting out or in simultaneously with all the rest, inspired the winners here to trample one another in a mad rush for the pay window. South America inherits a good deal of the Spaniard's highly polished manner, but it is a veneer that sits lightly on the bottom of the melting pot and wears thin on slight occasion.

The Englishman is fond of turf. For those Britons who were so largely responsible for the Antofagasta racing enterprise, however, there was little chance of gratifying this predilection among the gravel wastes over which the course was laid. The only green thing visible from the grand stands, aside from the cap of an occasional jockey, was a house garden half a mile away, outside a smelting plant smoking against the flanks of the foothills.

These bleak, landward ramparts of Antofagasta are a desolation against which it is almost futile for the city to struggle. They have been enlivened a little by the Yankeefied industry of a dozen business houses that have etched near their summits, in white-bouldered inlays, square-typed advertisements that are legible from far out to sea. But they are nevertheless inhospitable and forbidding to the eye, like the whole of the dessicated coastline fronting northern Chile and Peru.

Within the city, which lies on a site that originally must have been refreshed by not so much as a spear of growing grass, Spanish tradition has been carried out in the establishment of public squares, and here there is concentrated a bold effort to maintain oases of semitropical foliage.

We succumbed, near the end of our Antofagastan Sunday, to the caravel-like motor buses that do their best to keep street cars off the city's pavements. A familiar Detroit vehicle bloomed into shapes like those of a psychic garden. There was no apparent uniformity of dimension or motif, and the body builders, palpably local and Latin-American, seemed to have given complete liberty to their imaginations. Some, indeed, were suggestive of the high-sterned sailing-ships of the Spanish explorers; others were composed of timbers, ribbed and rounded, like mandolins; some were brilliant with paint but more were without any chromatic adornment at all; one or two provoked the picturesque notion of upright piano boxes animated by the possession of wheels.

Carousing over the city in these rollicking vehicles, fitting our knees carefully between seats better calculated for Japanese stature than for even the moderate proportions of the Chilean, we came at last, by means of such exploration, to the cemetery. There we spent the rest of the afternoon among the women and children busy with their chocheting and play. Iron gateways of the family vaults stood open before them, and fresh flowers lay within these almost cheerful retreats; the dead here seemed unterrifying and familiar. Beyond the city of marble vaults and the wall crypts that displayed tier upon tier of wreathed, epitaphed coffin niches, sometimes adorned with a photograph of the occupant, there was a forest of whitewashed wooden crosses marking the last residences of the poor.

In the main plaza, about which center the banks and other pomposities of the city's business life, we submerged ourselves in the Sunday evening *paseo*, an institution of old Spain that survives in some form even in the most modern of Castilian communities. In the Peruvian village of Yunguyo the promenade was of brilliant-hued Indians, fiesta-clad, shuffling their bare feet or leather sandals over the cobblestones of the public square; in Havana the idea was variegated by frequent carnival throngs motoring in unwearying procession up and down the Prado and the Malecon; in Buenos Aires there was the afternoon parade, *a pie*, through the narrow Florida, from which all wheeled traffic must

The port of Coquimbo, clinging to the bleak foothills of northern Chile

An Engineer's Solution of Money Problem

Control of Credit Is Vital, Necessary Thing, Declares Major Douglas, Londoner Whose Work on "the Douglas Plan" Has Brought Him Fame

By PAUL TYNER

I HAVE found the most interesting and worth-while man in London. He is the man who "sees through it." He sees clear through the mist and cloudiness to the cause of all our present muddle and mixedness, of war and menace of war, of unemployment, industrial depression and upheaval, and puts his finger surely and squarely on the particular system that is back of most of the ills with which humanity is today blindly struggling. He is a happy and hopeful man, because he realizes fully, in the words of a recent luminous article in The Dearborn Independent, that "to see through a thing is to let light and lightning into it; that honest understanding eyes bore through a wrong system like hot irons, honeycombing it with weakening tunnels." He realizes fully that not attack by invective or even voting against it, makes so surely for the destruction of an evil system as the understanding mind that just "sees through it."

Nothing could exceed the smiling serenity of speech and manner with which he talked to me this morning at his office in the Middle Temple. He does not get wrought up the least little bit and his manner and method are the very antithesis of that so often associated with the reformer.

The man is Major Clifford H. Douglas. He is a consulting engineer and one very much in demand, but he devotes his leisure to helping his fellows to see through the wrong of credit power and control exercised in the interest of the financiers and against the interests of producers and consumers.

Has Dozen Books to Credit

AMONG the dozen or so of books Major Douglas has published may be named, "Economic Democracy," "Credit Power and Democracy; With a Draft Scheme for the Mining Industry," "Credit Power" and "The Control and Distribution of Production." About a score of books have been written about "The Douglas Plan" and it has been discussed in the House of Commons and before many engineering and trade bodies throughout the United Kingdom.

May I set down at the start that Major Douglas begins where most American "currency reformers" leave off. He wastes no time arguing as to the comparative merits of coin and paper, inflation and deflation. That "money" in the old sense has become a myth and that the gold basis is a transparent fallacy he assumes to be too obvious and familiar facts in everyday experience to need argument. Getting right down to facts and assuming that every thinking man realizes the undeniable truth that credit has displaced coin as medium of exchange, he goes ahead and analyzes credit, points out its true basis and its actual relation to production and distribution. Then he shows how necessary to human welfare and progress it is that we should adopt a radical, yet natural and scientific, change in the *control of credit,* if we are to learn the lessons of hard experience and avert future chaos and disaster.

In passing, for the benefit of any readers who may still labor under the notion that "money"—meaning gold or its silver or paper representatives—is essential in modern life and business as a mechanism and medium of exchange, it may be pointed out that only about seven-hundredths of one per cent of the business transactions of civilized countries involve any actual transfer of money. The actual present situation in this regard in the British Isles is illuminating. Britain's total legal tender, including gold, silver, copper and treasury notes, amounts to approximately £200,000,000 or, say, one billion dollars. Yet from a superficial examination of the accounts of the banks it is plain that there is a great deal more "money" in the country than there is legal tender. The deposits of the "Big Five" banks and their affiliated concerns represent about £2,000,000,000 or $10,000,000,000 and overdrafts and bills discounted represent about £1,000,000,000 more. For all practical purposes all this "money" is homogeneous, as the average man would draw no vital distinction between 10 pounds in his pocket and 10 pounds in his current account with one of the big banks. The question arises: What has happened to transform this £400,000,000 of legal tender into £3,000,000,000 of "money"? The answer is simply that the banks and financial institutions have created £2,600,000,000 in new money which ranks equally with legal tender as purchasing power. The same sort of thing, in relative degree, is practised under the American banking system.

Irresponsibility of Bankers

"LET it be realized," said Major Douglas, "how complete and irresponsible is the control of the banker in the matter of loans. His grant of credit is entirely a matter of favor. *Two of the indispensable parties in the transaction,* **the consumer and the remaining depositors,** *are not consulted at all.* If collectively the banks refuse the loan, both producer and consumer are helpless. The queer thing about this situation is that it is not of the banker's own making and only exists by general consent. The moment the business community ceases to back the banker with *its* credit, which is the commodity in which he deals, his power will be gone.

In Germany this is beginning to be understood. For several months now, the Krupp firm at Essen has been issuing its own currency in denominations up to 500 marks. Obviously a concern which can issue its own currency and get it accepted does not need to go to a bank for money. Absolutely the only qualification necessary to the acceptance of any credit instrument called "money" is that it shall be effective in exchange for goods and services.

"The banker is probably the only known instance of the possibility of lending something without parting with anything and making a profit on the transaction while obtaining his commodity in the first instance free. But that is only the beginning of the tangle. When the borrowing manufacturer repays his banker with interest, the banker puts the interest to his profit and loss account and cancels the phantom credit in the borrower's account. But the depositor who has obtained the overdraft pays it out in wages and salaries, and these wages and salaries, together with the banker's interest, all go into costs. As all costs go into prices which the consumer has to pay for the goods, after the manufacturer has repaid the loan, there is $1,000 or $10,000 worth of goods (according to the amount of the loan) immobilized on the market, as no one, not even the banker, except potentially, has the money to buy them. Further, since the consumer, who originates the demand for all production, never has sufficient money to back his demand, every order has to start with the banker (whose objective is not that of the consumer) and percolate through the industrial system, reaching the consumer only perhaps months afterward and in a form which by common consent is unsatisfactory. Although the loan which the manufacturer had is cancelled when repaid to the bank, the loan which the workman receives from the employer in the shape of wages, and which he has to repay in the shape of general prices, is not cancelled in those prices. On the contrary, *the worker's cost of living today is inevitably added to his cost of living tomorrow!*

"This situation is the core of the world crisis through which we are passing. The vital defect in the present financial system is that it hampers and clogs the object for which it is supposed to exist. I take it for granted that the vast majority of people only regard employment as a means to an end—and that end is the obtaining of a sufficient supply of goods and services. An enormous step forward would be made if this desire for goods and services were met, even if the alleged demand for employment remained for the moment unsatisfied.

"Just now, let me say that I have no doubt that it is an entirely practicable proposition to meet fully the public demand for goods and services, if we will make that our first objective and let the matter of employment fall into its place as a by-product, so to speak. Every real economist and business man well knows that *one-tenth of the available labor today, working short hours, but with the whole attention directed solely to the objective of the most efficient production,* could supply all the general demands of the population of this country or of the United States.

Distribution the Problem

"PRODUCTION as a problem has been solved long ago. The problem we have to solve is the problem of distribution.

"Now organized distribution, whether it be the allotment of seats in a theater, in a railway train, or in benefits from a dividend-earning corporation, is always a matter of *tickets.* All the present trouble being due to an unsatisfactory distribution of tickets, the first thing to do is to straighten out the present kinks in the ticket system. The generalized ticket system under which modern distribution is carried out is somewhat loosely called 'money,' and it is in the money system that we shall find what we are looking for. In short, there exists in the world today a producing system which has an immense latent but unutilized capacity to deliver goods. Unemployment happens to be the most obvious but not the only indication of this failure to utilize. On the other hand, there is an immense body of unsatisfied customers. Standing between these two and outside both, and run with an objective entirely outside both, there is a Money System—that is to say, a banking and financial system.

"What the population of the world wants and is determined to get is a sufficiency of goods and services. There is no lack of these goods and services, either actual or potential; but they cannot be obtained except through the agency of money, of which there *is* a lack. This lack of money is in no sense natural, or unavoidable. It is wholly artificial, and is the result of a deliberate policy in the operation of the Money System, although those responsible for that policy may not be wholly conscious of the fact."

"But, Major," I interjected, "the bankers say that their system is an important and indeed necessary factor in facilitating business; that it provides a time and labor saving mechanism which makes it possible to carry on and expand production and exchange. You do not mean to say that bankers are not producers, that they render no service of value?"

"I mean," Major Douglas replied, "that there exists and is being exercised for anti-social purposes a monopoly of the 'ticket' supply, without which distribution cannot be carried on. There has been much discussion lately in the press over a speech of the chancellor of the exchequer in which he openly implored financiers to 'conserve capital' by which, as the context showed, he means *credit.* The speech is remarkable in the fact that it marks the first time in British history that a chancellor of the exchequer acknowledged in set terms that the financial group is absolute in control of the government and the country. Think what that means. Two or three great groups of banks controlled in many cases by men who are alien, and even anti-British alien, by birth and tradition; men *international* in their interests and quite definitely *anti-public* in their policy; men not elected by the people and not subject to dismissal, and so able to set at naught the plans of governments. Producing nothing themselves, these few men are yet able to control all production. *I do not believe there is a single considerable commercial organization in Britain or America, however apparently prosperous, which could live for two years against the active hostility of half a dozen of these men.* To them ministers of the Crown are servants appointed to take orders and dismissed if they are negligent in executing these orders. Wars, famine and desolation are simply implements called to the bankers' aid to conserve their control of credit.

"You have a striking example of that sort of thing in America in the decadence of your great railway systems. I remember how 20 years ago such roads as the Pennsylvania, the New York Central, the Baltimore & Ohio and the Missouri Pacific gave promise of forming a model transportation system. Today, looted, sacked and exhausted by one financial raid after another, they are almost *in extremis* and only maintain a service (which is a mockery to technical capacity) by a grant from the public purse of a sum substantially equal to the original cost of their construction. Let me add that every one of the groups which were directly responsible for this result is represented in the banks of the City of London, as they are represented in New York, Paris, Berlin and probably Moscow.

The Struggle of Finance

"A GRIM struggle is proceeding in the great international financial groups for the acquisition of key positions from which to control the World State when it is formed. The League of Nations, as at present constituted, seems to me to be part of such a plan. In view of the curiously circumstantial evidence brought forward by The Dearborn Independent at various times, and the immense importance of the issues involved, I certainly think that it is very much better that the fullest light of investigation, discussion and publicity should be allowed to play on the matter than that it should be hushed up. We want it cleared up, for the alternative will be an outbreak of popular fury in which the innocent are likely to suffer with the guilty.

"I may say that certain representatives of these 'international' banking groups have shown a lively interest in the Douglas plan. One from a leading banking house in the past few months has been assiduous in learning all he can about it. Not satisfied with reading my books, he invited me to lunch several times to question me and get me to talk about the plan inside out. He seemed insatiable in his thirst for information. At last, I had to decline further social invitations, telling him that while I was more than ready to give all possible information, I had to conserve my time. Several weeks later I was dining with a London banker of some prominence who had asked me to come to his house to present my ideas to a little gathering of friends in the financial and political worlds. To my surprise, among those who came in after dinner was this same New York 'international' banker. As a result, these interests seem to be carrying out a deliberate scheme to block all public discussion of the Douglas plan.

Cancelled on Eve

"LET me give you an instance. Recently I was invited to read a paper on finance before the annual meeting of the British Institute of Automobile Engineers. I warned the chairman of the committee that I should give utterance to some wholesome truths that might not be palatable to the financial interests allied with the automobile industry in this country. He told me to go ahead; they were fellow engineers and wanted facts and expert testimony as to the bearings of those facts on trade conditions. So I went ahead and even corrected proofs of my address for the institute's official journal. Only three days before the date set for the meeting, without the least warning, I received a wire cancelling the engagement. I asked for a reason but could get none. I sued for breach of contract and as they let the case go by default, the court awarded me a handsome sum as assessed damages. This I accepted only after formally notifying the institute that in doing so I waived none of my rights to publish the address or the facts in the matter. My own bank has not attempted to discriminate against me in the matter of ordinary business accommodations. In fact they have shown a quite friendly disposition; but several of my friends who have become identified with the Social Credit Movement have had the experience of difficulties being put in their way, presumably on that account.

"The monopoly of the 'ticket' supply without which distribution cannot be carried on must be broken. How it is to be broken is the very serious problem we now face. Unless it is solved, civilization will soon cease to exist. Not only must we break this monopoly, but we must also adopt such arrangements as will automatically prevent its re-establishment. This requirement, fortunately for its full and early solution, is closely interlocked with the second great objective to which we have to address ourselves—and that is the adjustment of the rate of issue of the 'tickets' or money to correspond with the rate of production of goods, so that there will be a continuous relation between tickets and articles, and so that we shall not have in future either an undue quantity of tickets, nor, as at present, a lack of tickets.

"The present dullness of trade and widespread unemployment and distress are plainly due immediately to the fact that prices are too high in relation to the purchasing power in the hands of the people—the potential consumers. At first sight, it may seem that this situation could be remedied by either issuing more purchasing power (money), or by arbitrarily reducing prices. But the problem is not quite so simple as that. If, having broken the monopoly of credit, we simply proceeded to give every one large overdrafts, it must be fairly clear in the light of familiar experience in these days, that we would be far from improving the situation. All we would accomplish would be to create a feverish boom in production accompanied by a spectacular rise in prices. That, of course, is exactly what is happening in Germany today. If, on the other hand, we should arbitrarily reduce prices by means of a rigid government control, it is equally obvious that we should strangle production, cause widespread bankruptcy, and probably arrest our sales of commodities."

"And what is your remedy?"

"The engineering solution, which I believe to be the only common-sense and practical solution, is that we should place ourselves in a position to be able to say to the manufacturers and retailers: 'We will assist you to sell to the public at lower prices than you can sell without our assistance.' Let us note carefully the series of remarkable results that would follow. In the first place, we benefit the public, as individuals, by lowering prices. Thus we enable them to *get* at once the goods and services which all agree they rightly demand and intend to have. Without going further, it will be seen that we also benefit the trader to whom we extend this assistance, because he is enabled to undersell any competitor not so assisted, his turnover increases, and thus his business flourishes and expands. One immediate effect of this increased flow of business is to stimulate employment."

How It Would Be Used

"BUT what would be the source from which such 'assistance' could be drawn?" I asked. "Surely you do not think the government is an inexhaustible source of wealth?"

Major Douglas smiled. "Certainly not," he replied. "We have a much better source and that source is the same source from which the banker now, *for his own purposes,* creates additional purchasing power through the medium of overdrafts, bills discounted and other forms of 'loans.' *I would apply a portion of the credit so created to the reduction of prices and a portion to the creation of new purchasing power."*

Major Douglas expressed the opinion that present prices in England—they are about the same in America—are still about three times what they ought to be and what they would be under a really scientific credit system. Keeping in mind what has already been said as to his contention that credit control should be in the hands of the consumers, and not of the financiers or the producers, he puts forward these two important definitions:

> *Real Credit* is a correct estimate of the rate, or dynamic capacity, at which a community can *deliver goods and services* as demanded.
>
> *Financial Credit* is ostensibly a device by which this capacity can be drawn upon; but as a matter of fact today it is a measure of the rate at which an organization or individual can deliver *money*—which may or may not represent goods and services.

"Speaking as an engineer," said Major Douglas, "I have no hesitation in saying that it is the *program of production* and not the *productive process* which is chiefly at fault, and that where the productive process is working badly it is because of the inclusion of unnecessary labor in it. If wages and salaries, forming a portion of *costs* and reappearing in *prices,* are to form the major portion of the purchasing power of society, then modern scientific progress is the deadly enemy of society, since such progress aims at replacing the persons who now obtain their living in this way by machines and improved processes. Prices cannot be less than costs over any considerable period of time. Therefore, if a portion of the 'costs' of production are allocated to machines, and yet reappear in ultimate prices, it is obvious that these 'costs' in the shape of purchasing power so distributed in wages, salaries and dividends, to individual consumers of ultimate products, are not sufficient to pay these prices.

As to "Intermediates"

"THIS carries us to a consideration of a factor usually overlooked by the cost accountant; that is the effect on the prices of ultimate products—those consumed by *individuals*—of the production of *intermediate* products—tools, machinery, factory plant and equipment. Just realize that while the flow of purchasing power to individuals is not sufficient to buy the total price-values created in the same time, a great and steadily increasing percentage of the total production of the world is *not* bought by individuals at all, and is not intended for their consumption. It is bought and paid for by organizations, national or other, and is of no use to individuals. The costs of this production *should*—but under the present system does not—represent effective demand in the hands of individuals. The more of these intermediate products brought into being under the present system, the higher go the prices of goods intended for individual consumption. On this account, the cry for indiscriminate super-production is both inane and mischievous. Plainly, it is immaterial whether more or less goods are made and more or less money distributed, when *any* quantity of goods less than sufficient will absorb all the money that is available. Because the incentive to production is *money,* production stops when there is *no more money.* Under the existing credit system, the control of intermediate production is not distributed to ultimate consumers at all, and it gives them no say whatever as to the quantity, quality or variety of ultimate products. The distribution of purchasing power thus fails to distribute *the product.* Since production stops when distribution stops, the system would appear to be quite unworkable. Yet we know that although the grinding and groaning of the machine is audible evidence that it is working very badly, it *is* working. That distribution of a sort takes place at all is due to two factors: export credit and loan credit. Unhappily, all industrial nations are competing for export credits—and the end of that is war."

Asked for an illustration of what he meant by "intermediate products," Major Douglas answered:

"It is a necessary incident of modern large-scale production. If you want to buy a loaf of bread nowadays, what you really are forced to buy is something much more than bread. Before the flour can be mixed and the dough baked, great ovens have to be provided, as well as mixing vats and other machinery, possibly including electric and heating power equipment. So every loaf of bread involves the output of building materials and of coal, iron and copper mines, foundries and machine shops, to say nothing of rail and water transportation and automobile delivery systems. Credit is used up at every step. A striking example was the American appropriation during the war of several hundred million dollars for airplanes. The 'money' was all spent, but only a few airplanes had been produced up to the time of the armistice. The colossal expenditure went into buildings and machinery and raw materials."

Answering further questions, he went on:

"The first modification called for in the present system is a cutting of phantom costs out of prices. Business men know that 'the price of a thing is what it will fetch.' They know that a rising demand (with money in the jug) means rising prices, and a falling demand (due to lack of money) means falling prices. I challenge the current delusion that industry is forced to demand from the public more money than it distributes to the public through wages, salaries and dividends. If it were, the inevitable consequences would be—as at present—an unsalable surplus leading to slumps and bankruptcies. Suppose a concern is manufacturing and selling its goods at certain prices. It raises and spends a million pounds for 'capital development,' that is to say, additional plant. This money is distributed through the employes concerned to the public. This addition to purchasing power increases the demand for the goods manufactured by the firm, and up go prices. The increase is approximately the million dollars, so that the concern gets back the million it expended on capital development. Yet this million dollars remains on the books as a 'cost' to be allocated to the goods that eventually emerge from the additional plant. But this amount having already been extracted from the purchasing public in the shape of prices, it cannot be extracted from them again. If, as a matter of fact, it is extracted, that is made possible only by fresh loans in a vicious circle."

Control the Vital Issue

MAJOR DOUGLAS' method of meeting this difficulty has been embodied in the concrete plan for the coal mining industry which he submitted to the Sankey Commission, and it practically applies to all industries. That plan is an elaborate one, scientifically worked out, and cannot be gone into in detail here. Roughly, it provides that prices would fall as the total cost, including a fair profit, should fall; consumption tending to increase with the decrease in price; and that any increase in costs should not alter the price. Any increase in profits, resulting from keeping the nominal costs the same although actual costs are reduced, would be shared out as follows: One-quarter to the representatives of the workers; one-quarter to the shareholders, and one-half to the National Credit account, forming a fund from which advances would be made without interest to make up to the owners any difference between actual cost and actual prices when necessary to keep the mines going and prevent lessened demand by consumers. The chief aim is to make the total purchasing power equal to total prices by the addition of a credit issue to purchasing power, taking capital costs out of prices and distributing them as purchasing power. The trustee for the collective credit based on real capacity to deliver goods and services which is represented by plant, tools, processes, and so on, would be the National Treasury.

"The correct use and control of credit," Major Douglas contends, "is absolutely the vital issue of the present era."

And lots of people appear to be waking up to this view.

There's Real Paving in Antofagasta

Concluded from page 7

be excluded to make way for the array of walking sticks and Paris hats; in Seville the procession was a slow trot of carriage horses along the Guadalquivir, a persistent souvenir of the leisurely days when gasoline was not; and in Madrid, the bedizened whirl of limousines up and down the brilliant avenue of the Recoletos and past the boulevard seats of the Alameda.

Here in Antofagasta the *paseo* still clung to its proper place, the principal plaza, and the *gente decente*—the "decent gentry"—arrayed and uniformed in its utmost, went arm in arm over a broad sidewalk, mingling perfumes with the breath of exotic blossoms overhanging the park benches, and exchanging significant greetings and glances at recurrent encounters in the treadmill peregrination.

A chocolate soldier quality seasoned this grand march, for there was a liberal spicing of the military; swagger-sticked, mirror-booted army officers in uniforms of distinctly Prussian influence; crinkly white duck, splashed with a touch of red and gold, a sartorial motif borrowed from the tailors of the British navy. The eyes of these caballeros were even more smoulderingly and frankly alert to feminine charms than those of the civilian Don Juans.

Above—One of the innumerable street markets of Chile.

At left—From the mausoleums of the rich to the graves of the poor, in Antofagasta's cemetery

In spite of fastidious elaboration in the costumes of both sexes, there was an unexpected somberness in general effect, due to the prevailing tint of black. We had always considered this hue fundamental to Spanish beauty—black hair, jet eyes, and black *mantilla*—yet it was almost a shock to see the idea carried even so far as the men's straw hats. There were no *mantillas*—outside the ball room we rarely saw these elsewhere than in Andalusia—but full half of the women seemed to be in complete mourning. Black, too, appeared to be the prevailing masculine color, in consonance with those astonishing hats of funereal straw. No barn-red and parrot-green Indian ponchos, at least, draped their inharmonies over the public square or rubbed dustily against the elegance of the promenade. We saw no aborigines in Antofagasta, a salient contrast with the mountain cities of Bolivia and Peru, but there was an unmistakable tinge of the indigenous facial mold and color in a large part of the population.

Countenances made familiar by the repetitious encounters of the *paseo* were visible, after a late dinner, at the principal theater. We listened there, for a time, to the loquacious and inactive dialog of a troupe of Spanish comedians, most of whose lines were lisped in antiphonal response to the prompter's audible reading; then we went out to appease our limited understanding of *la lengua español* with the more facile Castilian sub-titles of an American-made motion picture. We were almost able, through contagion from our fellow spectators, to join in their applause of a pie thrower and the heroine of a jungle melodrama dating well back into the pioneer days of the photoplay industry. With them we stamped and cat-called when the film broke, and together we hissed the villain.

There was no glitter of fresco and electricity in front of the picture palaces; and from their dingy, bill-postered doors the spectators vanished speedily into dark streets. Sounds of night revelry were rare, and there was no white way. The café is a saloon, frequented by men only. Women dine seldom in public.

No doubt there is a younger generation that will change all that. We saw some members of it, we supposed, in the tea rooms, and in an ice cream parlor, where a small group of young people passed Sunday midnight in consuming sodas and dancing jazz.

Players' Pranks No Longer Part of Baseball

Major League Professionalism a Stern Business Proposition That Wins a Support—Newspaper Publicity—That None Enjoys

By A Veteran Sports Writer

BASEBALL, regarded as our national sport, is really one of our leading business enterprises. The commercial angle of baseball has created one of the best dividend-producing investments in history. Not in all the country is there another venture with the business advantages enjoyed by baseball.

There are in the major leagues 16 baseball clubs. Each club carries an average of 25 men during mid-season and more during the early and late part of the season. The teams represent the large cities of the East and Middle West and civic pride is vested in them. The citizens refer to the organizations as "our team" and "our club" but, among the 400 players that are employed on 16 major league teams in mid-season, I do not believe there are five that are bona fide residents of the cities they represent. In the spring of the year the players are called to assemble at certain points south of the Mason and Dixon line to engage in preliminary practice and, as soon as the season closes, these players hurry back to the points from which they came seven months previously.

The only thing local about any team in the major leagues is the crowd. They bask in civic pride when the team is up in the race; they are steeped in gloom when the team is losing and wobbles somewhere in the second division. As far as the players are concerned, it makes no difference to them where they play, as long as they get the money they want. Of course, for the same salary, most of them would like to play in New York. There is a certain glamour about playing on Broadway that appeals to players. Detroit is a favorite town because of the loyalty and fairness of the baseball followers there. St. Louis and Washington are not popular because they are too hot during the summer. A team that has a chance for the pennant, or second or third place, naturally appeals to players because finishing first, second or third, means much extra money.

Have No Fear of "War"

NEVER in the history of business or sport has there been anything quite like professional baseball. The owners are protected under the national agreement with far greater safety than one can find in business. The club owners united, guard their investment and guarantee against competition. Territorial rights are sacred and competition against this combine means absolute financial failure as the Federal League established.

The club owners whose money is invested have no fear of a "trade war." There is no such thing in professional baseball. There will be no bidding for talent, no "stealing" of employes by rival employers, no price cutting in admission rates. The greatest worry that the average business man has is removed from the men that have their fortunes tied up in baseball.

The greatest asset of the club owners is, of course, the columns of the sport pages of the newspapers. Here they command something obtained by no one else—free publicity. Column after column is devoted to baseball from the day the players report in the southern training camps until after the close of the season. At frequent intervals between seasons you can read baseball news; it is kept alive through 12 months of the year.

A man buys a major league franchise. He sends representatives over the country to gather likely looking players. He brings them from all parts of the United States to represent the city where his money is invested in a franchise. Not one player, quite likely, is really a representative of the city. Nearly every player is a stranger. And then the local newspapers devote columns to this enterprise, giving it free advertising in tremendous bulk, sending special writers to report all the moves, the news and the features, advertising the team two months before it is ready to exhibit. It is the best advertising obtainable and does not cost the man who has his money invested in the club a cent.

No Publicity for Others

IF THE average game attendance of a major league team is 2,500 (and it is much more than that) then the motion picture houses outdraw the ball team by many times 2,500 daily. But, there is no free publicity for the motion picture theaters for, while they get publicity, this is paid for. The theaters that get publicity advertise heavily and for this advertising they pay amusement rates, the highest charged for newspaper advertising. As pointed out, many times as many persons attend motion picture houses as attend ball games and there would be many times the interest in motion picture news that you find in baseball. There is no reason why the motion picture houses should not get more free space in the newspapers than the ball teams. Both are professional amusement enterprises, conducted for private gain.

The large department stores spend fortunes with newspapers annually. They are responsible for a large percentage of a newspaper's earnings. You never see free publicity given a department store in the newspapers of major league cities. A double header is played at the ball park and a few days before this double header takes place the fact is announced in the newspapers, the announcement being quite often "boxed" and given unusual prominence. The public is informed that such and such a day "will be bargain day at the local ball park." You can see two games for the price of one admission.

The city's leading department store decides to have a big bargain sale. Wearing apparel and household goods are offered at greatly reduced rates. The sale means much to many families. Do the newspapers treat this as a news item? The newspapers permit the store owner to use an entire page of the paper to give a detailed account of the sale and all the store owner must pay is from $500 to $1,000, depending upon the newspaper, its circulation and the kind of contract for advertising that this particular store has.

Immediately following the war period, when food prices were very high, many merchants, realizing that prices must tumble and wishing to establish themselves well, started to cut the prices of food. No mention of such cuts was made in the newspapers, unless within space limits sold to the store for advertising rates.

Baseball clubs have an advantage that can be found nowhere else. Newspapers make business for the club owner. He is certain of heavy profits as long as the sporting pages are open to baseball. The season of 1922 was the most profitable in baseball history, and 1923 should be even more profitable if the free advertising continues, which it probably will.

As baseball is conducted today it carries everything employed by every successful business enterprise. There is system carried to a scientific extreme. An office staff looks after all the business matters and of these there is an enormous amount. The baseball parks are known as plants and these structures, nearly all of steel and concrete, attest to the success of the venture. The players themselves have become keen business men and they are in baseball as other men of their age are in the real estate business, shoe or clothing business, or any other commercial venture.

Playing ball is work and the player handles it accordingly. If Cleveland loses it is a tragedy to many Clevelanders, wrapped up in the rise or fall of their team, but to the player no such viewpoint presents itself. Cleveland never enters into his reckoning. We simply mention Cleveland as an illustration. The player is not fighting for the civic honor or glory of the city his team represents; his chief interest is in the hit column, unless he is a pitcher, and then the won and lost column of the pitchers' averages concerns him most. His salary for the following season is based chiefly upon his record for the current season. A team may be badly beaten but the player, if he has had a good day at bat, is not downcast over the result.

Baseball is not what it was 10 and 15 years ago. The difference is to be noted in the training camps. Years ago the spirit of play hung about these baseball corrals in the southland each spring. The veteran player eagerly looked forward to the trip. To him it was a lark. There were the same possibilities that present themselves to the members of a high school fraternity on initiation night. Fun and frolic were ahead.

Training Means Work

TODAY the training season means hard work, work demanding conscientious application. The player is tested. A job depends upon the result of the test. He goes about the matter in a businesslike way. He concentrates upon the work of the day and he abhors frivolity. This is the general attitude of players in the baseball camps of Dixieland.

The badger fight has gone. Snipe hunting has passed outside the baseball law. Express trains roll through the night without a recruit ball player clinging to the rear platform of the rear car, desperately grasping a red lantern. The "hammocks" in the Pullman berths are now used for clothes instead of pitching arms. The recruit pitchers do not write to patent medicine companies, ordering "fast-ball oil." The recruit goes his quiet way with a sporting chance of making good and clowning for no one.

The first important event of a spring training season used to be a badger fight. Every major league camp in the country had at least one badger fight. As soon as the advance squad arrived preparations were begun. Deep thought was given to advertising the affair and this was accomplished with an astonishing thoroughness. No detail was overlooked and there were more details than can be found, as a rule, in other sporting ventures conducted on a mammoth scale.

Huge signs announced the fight. The date was always included, also the place selected. Posters were distributed and everybody talked about the event. Conversation was necessary to preparation; everybody must become excited or pretend to be.

In a week or so there appeared in town a badger, safely caged. The badger, naturally, was the principal. The animal was put on exhibition in the lobby of the leading hotel, or in the principal saloon or, at times, in the window of a store.

The badger would be pitted against a bull terrier. Frequently a mean-looking bull terrier was put on display. Like the badger, the dog was caged. The dog was always identified as the winner of 19 or more famous fights with badgers. The badger had never suffered defeat. Getting these unbeaten animals in the same pit meant a duel between unconquered beasts. It was bound to be worth a busy man's time.

Soon "excitement ran high." That was part of the stage setting. Heavy wagers were placed, some picking the badger, others stringing along with the dog. The wagers were always made publicly.

All this time search was being made for a victim. Perhaps there was trouble in selecting a victim; there would be four or five candidates and the promoters could not decide upon one man. Each was "hopped up" until a decision could be made.

Often the official referee was not selected until the night of the fight. This was part of the play, a stage effect. The idea was to make the victim all the more anxious to accept the appointment.

The ball players, of course, were the principal actors. The townspeople furnished the stage setting and background but the players were to furnish the chief actor. They always did. And always the candidate was a recruit.

On the scheduled night, players, townsmen and folk from the countryside assembled. Here the advance "stuff" reached its climax. There was heavy wagering. Usually there were many arguments. All means that could be employed to add excitement were introduced. Everybody became agitated. There was a pause when the badger was brought in. He was exhibited and the result was more excitement, higher betting on the badger. The animal was then removed.

Finally it was announced that everything was ready. The announcement was applauded and then several asked who would referee. Sometimes a man was named but often the announcer replied that the referee had not been agreed upon. After much argument a referee was announced. However, this referee was not one that the promoters intended to use. As he stepped into the arena he was challenged. Several men questioned his honesty, his courage, his physical fitness. Insults were exchanged and there followed challenges to fight. Often there would be fights, some of them most realistic. I have known participants to rehearse them carefully for days and days. Sometimes there was a free-for-all battle exceedingly well done. When order was restored the referee retired, indignantly refusing to officiate.

The crowd would then begin selecting a referee, "a man of courage, honesty and popularity." Names were presented and hooted down or disagreed upon. After many arguments the name of the intended victim was finally introduced and the ultimate result always was that he became the choice.

No Badger Fight Today

THE arena was a large square, covered with sawdust. In the center stood a wooden box, with a long rope protruding. In one corner stood the handler of the bull terrier, holding his mean beast by the leash. The referee's duty was to pull the rope and release the badger. At the same time the handler of the bull terrier was to release the dog. The referee was in entire charge of the proceedings and it was up to him to see that no unfair tactics were used and that the two animals received an even chance. The fight, of course, was to the death.

A signal was given and the referee gave the rope a quick jerk. However, instead of releasing a badger, the referee jerked out a jug of water which drenched his clothes. Then everybody howled with delight and the rookie ball player, who so gallantly acted as referee, was joshed for weeks.

Weeks of careful planning, infinite pains, endless publicity and preparations, with a drenched ball player as the climax, the badger fight was the high spot of every training season and of every major league club. It was as important to the season of preparation as opening day is to the regular pennant season.

The victim, naturally, was always somewhat annoyed, but this feeling vanished after several weeks and then he joined the large society of former referees and waited for the next spring to come when he would promote a similar affair for another victim. He was always successful, unless he failed to make good in the major leagues.

Ball players today would not think of holding a badger fight. The work that such an affair demands makes no appeal. The tone has changed and players view matters differently. There would be nothing gained, only time lost.

Holding the Red Lantern

SNIPE hunting has also been discarded. It was always a favorite pastime. Snipe hunting never received the prominence that was granted the badger fight and snipe hunting really did not start until after the badger fight was over.

Victims were many. The game was to invite rookies to hunt. Each intended victim was supplied with a bag and the perpetrators were armed with lanterns. Snipe were always hunted on dark nights.

The selected victims would be taken to a dark woods, several miles from the training camp. The object was to get the victims far from the town and main roads. The party walked steadily into the woods. The victims were stationed as far apart as possible. They were told to wait silently. The promoters would drive out

Federal Court Flouted in Cronkhite Case

Concluded from page 6

The Decision on Rolland R. Pothier

upon to show that the trial court would have no jurisdiction, we may consider also whether it overcomes the *prima facie* effect of the indictment upon the question of probable cause. Hastings v. Murchie, 219 Fed. 83, 88.

"The evidence presented at the hearing comprised in addition to the certified copy of the indictment, a large number of documents and the oral testimony of three witnesses, all relating to the question whether Camp Lewis was land 'theretofore acquired for the exclusive jurisdiction thereof.' As to the other allegations no evidence was presented which affected the *prima facie* case. See Gayon v. McCarthy, 252 U. S. 171; Tinsley v. Treat, 205 U. S. 20, 31.

"The defendant introduced a photostatic copy of a deed by Pierce County to the United States, dated October 1, 1919; (nearly a year after the alleged murder), purporting to convey certain lands to the United States for military uses; and also a copy of an Act of the Legislature of Washington passed January 27, 1917, called Chapter 3, Washington Laws 1917, constituting Pierce County 'as the arm and agency of the state' to condemn certain lands in that county and to donate them to the United States for military purposes.

"The argument of the defense is that by the terms of the statute the passing of the deed is a prerequisite to the exclusive jurisdiction of the United States, and that as the deed post-dates the time of the alleged murder the United States did not then have exclusive jurisdiction over the lands conveyed by said deed. But the evidence shows also that before the passage of the deeds, and before the date of the alleged murder, Pierce County, acting as the arm and agent of the state, had acquired by condemnation, and had turned over to the United States military authorities, many tracts of land comprised within the Camp Lewis military reservation, which had been selected by a representative of the Secretary of War, and which, when donated to the United States, the Secretary of War had been authorized to accept. Buildings had been erected and the camp permanently occupied before January 29, 1918, and before July, 1918, there were 50,000 men in camp.

"There is much evidence tending to show that as to a number of the tracts of land comprised in the camp there was, before the date of the alleged crime, a practical consummation of the donation, and that the agents of the county and of the United States had done all that it was necessary to do in order to vest title and exclusive jurisdiction in the United States, save the execution and recording of the deeds whereby the title of the United States should be evidenced.

"The contention of the United States that the evidence of *de facto* exercise of exclusive jurisdiction is sufficient in itself to show probable cause cannot be disregarded, in view of the *quaere* in Holt v. United States, 218 U. S. 245, 252: 'The documents referred to are not before us, but they properly were introduced, and so far as we can see justified the finding of the jury, even if the evidence of the *de facto* exercise of exclusive jurisdiction was not enough, or if the United States was called on to try title in a murder case.'

"The United States Attorney urges that the expression 'to be evidenced by the deed or deeds of Pierce County,' and so on, indicates that the deed was not to be the conveyance but only evidence of a prior donation. The defendant, however, urges that the assent of the state to the exercise of legislative jurisdiction is limited to lands which have been conveyed by deed.

"The United States Attorney also contends that the testimony and documents offered by defendant are insufficient, since the defendant has failed to prove that the deed described all the lands in Camp Lewis Military Reservation, and suggests that there are indications in the documentary evidence of the probability that some land not donated by Pierce County may be included within the reservation.

"At the hearing the defendant's contentions as to legislative jurisdiction of the United States went to the whole reservation; some 70,000 acres, more or less. There was no agreement or definite evidence as to the exact *locus in quo*. It is, therefore, impracticable for this court to go into the details of the acquisition by the county, the transfer of possession to the United States, and the uses of the different tracts which were from time to time added to the reservation. In the trial court, upon the establishment of the exact place of the alleged murder, many of the questions now suggested will disappear, and the inquiry limited to a small area.

"The jurisdiction of the trial court being clear, and there being many disputed questions of fact and law, it is evident that this court cannot properly assume the functions of the trial court. Henry v. Henkel, 235, U. S. 228, 229.

"I am of the opinion that the defendant has failed to overcome the prima facie case made by the indictment, and that the evidence fails to show the want of probable cause.

"A warrant for removal may issue in accordance with the prayer of the petition."

Pothier thereupon having been placed in the custody of United States Marshal Rodman, Mr. Arnold, the prisoner's counsel, applied for a writ of *habeas corpus*. This was denied by Judge Brown, in the following opinion:

"The questions arising on this petition are substantially the same as those disposed of by the opinion of this court upon Petition for Warrant of Removal, in Misc. No. 3270, filed this day. It appearing that *the indictment was by a court of competent jurisdiction, that there was probable cause for his commitment by the commissioner, and that his imprisonment, restraint and detention were in accordance with law,—*

"The Petition is denied."

The Decision on Robert Rosenbluth

but had already issued a report, in which he embodied, without question, affidavits submitted by Rosenbluth's lawyers, Goldstein & Goldstein, and in which he had "exonerated" Rosenbluth. By this strange behavior, Selden disqualified himself from ever trying the Rosenbluth-Cronkhite case.

So Louis Marshall and Jonah J. Goldstein well knew that *if the government could be declared to have no jurisdiction, their client could never be tried by Selden, the prosecutor for Pierce County. This was the impasse they hoped to create.*

On January 4, Commissioner Hitchcock rendered an oral opinion on the case. He stated that the identity of the defendant as being the person indicted was admitted and the indictment on its face appeared a valid one. A *prima facie* case had been made out before him by the government. *"The evidence presented before me has tended to show the defendant's innocence rather than his guilt. As to the jurisdictional point raised by Mr. Marshall, that is not for Sam Hitchcock but for Chief Justice Taft to decide."* Finally he directed that all records in the case be presented to a Federal judge for decision.

The hearing, having been confined merely to removal proceedings, any evidence introduced tending to show the prisoner's innocence or his guilt would have been inadmissible. Sam Hitchcock was not charged with the duty of evolving an opinion on that matter.

It will be seen that Mr. Hitchcock was in a state of cruel indecision. He felt that an adjudication of the question of the government's jurisdiction was not in his purview and was beyond his authority. Not being a judge, not presiding at court, his functions being merely quasi-judicial, he felt the need of a decision being rendered by a judge of the United States District Court.

It so happened that seven days later, on January 11, a decision was rendered on this very point of jurisdiction in the same case by Arthur L. Brown, United States district judge of the District of Rhode Island. Judge Brown held that the government did have jurisdiction in trying the men indicted for the murder of Major Cronkhite, and granted a warrant to the United States Marshal for the removal of the prisoner, Pothier, to Tacoma.

This decision was now in the hands of Mr. Hitchcock, and undoubtedly added to his perplexity and uncertainty. He went to the judges of the United States District Court, of which he is an appointee, for advice. I am credibly informed that a circuit judge to whom he applied, said to him:

"Well, you've flunked on it, and it's up to you to make a final decision."

On February 13, 1923, Commissioner Hitchcock thereupon made the following decision:

United States Circuit Court:

Southern District of New York:

United States of America

against

Robert Rosenbluth,

Defendant.

"Since the hearing before me on the 4th day of January, 1923, *efforts have been made to bring this matter before the court, or one of the Judges of the Court for review,* in accordance with the suggestion made before me at that time, *but there seem to be difficulties in the way of doing so.*

"In the case of a holding and a commitment in removal proceedings, relief may be obtained by writs of *habeas corpus* and *certiorari.*

"In the event of a dismissal of such complaint before a Commissioner, there seems to be no right of appeal. However, there seems to be no reason why a proceeding *de novo* could not be instituted inasmuch as *the hearing before the Commissioner can in no sense result in a final determination of the issues involved.*

"It therefore devolves upon me at this time to decide this matter according to my best judgment, which I have already expressed upon the record at the last hearing, and in accordance therewith *I find that the Federal court in the state of Washington has no jurisdiction in the premises and I therefore deny the government's petition to remove the defendant to the Western District of Washington for trial upon the indictment there found and hereby dismiss the complaint herein, and order that the bail heretofore given by the defendant in this proceeding be discharged."*

Dated New York, February 13, 1923.

A DECISION of the United States Supreme Court is the law of the land. The Supreme Court has decided that a United States commissioner, sitting to issue warrants of arrest on preliminary hearing, is not holding in any court of the United States at all—not even an inferior court. Similar decisions stand on record in the United States Circuit Court and the United States District Court.

The action of United States Commissioner Hitchcock, in declaring that the United States Government did not have jurisdiction over Camp Lewis at the time when the alleged murder of Major Cronkhite occurred, and his steps in discharging Rosenbluth's bail and liberating the prisoner, *were not the action of the United States District Court for the Southern District of New York.* The United States commissioner was not the proper officer to whom should have been submitted the question whether or not the government had jurisdiction in the Rosenbluth-Cronkhite case.

Mr. Hitchcock plainly shows by his actions and statements that the above is also his belief. In his preliminary report he says: *"As to the jurisdictional point raised by Mr. Marshall, that is not for Sam Hitchcock but for Chief Justice Taft to decide."* Then he directs that all records in the case be submitted to a district judge for decision.

Later we see Mr. Hitchcock, Judge Brown's decision in hand, going personally to the judges for advice. But since he has already stated his views on the case, they apparently did not wish to be involved in his contentions. Then the commissioner issues another statement, in which he protests that "efforts have been made to bring this matter before the court, or one of the judges of the court for review, *but there seemed to be difficulties in the way of doing so.*" Then he seems to deliver advice to the prosecutors that they begin a "proceeding *de novo*"—that is, start the case all over again.

But the most significant statements of Mr. Hitchcock were: "In the event of a dismissal of such complaint before a commissioner, there seems to be no right of appeal. However, the hearing before the commissioner can in no sense result in a final determination of the issues involved."

Is there no appeal from a decision of a United States commissioner? There certainly is. The Supreme Court has said that a district judge may at any time review arrest proceedings taking place before a United States commissioner. The day after Mr. Hitchcock stated that there was no appeal from his decision, Judge Learned Hand, of the United States District Court for the Southern District of New York, granted an appeal from a decision of Mr. Hitchcock's, and reversed it.

Why was not the Rosenbluth affair brought before a United States district court as the Pothier case was taken before a United States district court? Why, if the hearing before the commissioner cannot result in a final determination of the issues involved, was a man, indicted by the United States for murder, liberated before those issues were determined?

The peculiar position in which Robert Rosenbluth has now been placed, and the rebuke administered to the situation by the senior judge of the United States District Court in New York will be dealt with in a succeeding chapter.

Nothing Is Ever Done to Prevent Famines

Russia and India See Suffering But Surplus Grain Is Never Stored

> **Job. 38:28.—Hath the rain a father? Or who hath begotten the drops of dew? . . Canst thou lead forth the Mazzaroth in their season?**

By HERBERT J. BROWNE

This is the third of several articles by Mr. Browne, taking up the dependence of crop conditions upon the weather and discussing the possibilities of a drought. Mr. Browne also offers a suggestion designed to do away with the possibility of famine.

WEATHER history justifies the statement that variations which affect future weather conditions, like extremely dry weather on the Western Plains and a thin Canadian snow cover, continue to a grand climacteric of abnormality, which in America takes the form of a nation-wide drought or a repetition of that extraordinary year 1816, the "Year Without a Summer."

In either form, the probabilities are for a continuation of the freak weather of 1920-22 until, perhaps, 1926-27, the period for the recurrence of the great 55.6 year cycle of maxima of sun spots and aurora borealis. What the sun spots and the northern lights portend is yet to be unfolded, *but they go together.* More heat reaches the earth, and during the display of lights all telegraph, telephone and wireless systems go on a rampage. And weather eccentricities either above or below the par of normality charge compound interest.

Let it be restated: Following a series of unusual years, with a mild, dry, open winter, the displacement of the Atlantic and Pacific Subpermanent Highs and Lows far north of their regular locations will be the first signs of a severe drought—not the *causes* but the *indicators.* The causes will be a high thermal condition in the arctic and a low thermal condition in the tropics, which will produce a stagnant High over the continental area.

The absolute failure of crops from an almost unprecedented drought was the main cause of the Russian famine. Western Russia takes its climate from the same meteorological sources as Central and Western Europe, but the vast granary stretching from below Moscow to the Crimea and east to the Urals and the Kirghiz Steppes, including the entire Volga basin, is Asiatic in its weather factors. The huge ramp of the Himalayas gives to China, Indo-China, Siam, Burma and India *the rains which feed half the populations of the world,* but its western and northern slopes are thereby cut off from the abundant moisture of the Indian Ocean. Russia, like North America, is a vast plain opening to the arctic, with Western Siberia (substituted for Canada) as a contributor to Eastern Russian weather conditions.

Mean temperatures decline toward the east due to the severity of Siberian winters. In annual temperatures the Russian wheat belt corresponds to Wisconsin, Minnesota, the Dakotas and Western Canada.

The Russian winter is longer than ours, and the crop period is therefore shorter. Kishinef has 85 days below freezing, while in Kansas the period is 60 to 70 days and in Oklahoma, Southern Missouri and Southern Illinois the period is from 30 to 50 days. But the shortness of the season is in some degree atoned for by its greater heat.

In the districts where the drought and consequent famine were severest, the normal rainfall rises from 5.9 inches in the Aral-Caspian region to 11.5 in the Middle Volga. In these parts droughts and partial crop failures are frequent. The central black-earth belt suffers most. The southern provinces of Kishinef, Kherson, Don, and Astrakhan (which lies across the mouth of the Volga at the head of the Caspian), are like Iowa and Nebraska, while Northern Caucasia between the Caspian and Black seas is more like Missouri and Kansas, but it has the even milder winter climate of Oklahoma and North Texas.

South Russia from its remoteness loses the influence of the weather which covers Western Europe. The arctic and northeastern winds which sweep down from the Siberian plains bring dry air in winter, cold from November to March, and warm and dry the rest of the year. The winds of Southern Russia are influenced principally by the comparative Low of the Black Sea and by the comparatively high pressure of Central Russia and Siberia. From the middle of May to the middle of August, western and northwestern winds prevail in Southern Russia due to the high pressure of Western Europe and the low pressure of the Kirghiz Steppes.

The Russian Commission of the Near East Relief left Tiflis August 16, 1921, and returned September 12, having traveled 4,863 miles. The urgent necessity for haste accounted for their seemingly superficial examination. They had, however, been in the semi-independent provinces of Algaria, Georgia, Azerbaijan, Daghestan and Gorsk in the Near-Caspian and in the Russian provinces of Stavropol, Kuban, Don, Kharkov, Voronej, Ryazan, Moscow, Penza, Simbirsk, Samara, Tzaritzin, Astrakhan, Saratov and Tambov. Nearly 600,000 square miles of the Volga basin, the granary of Russia, were desolate. Even the grass was dead.

The drought was in itself as severe as the one of 1911, and only exceeded by that of 1891 over practically the same territory. The drought of 1921 struck its first blow in April. For April and the ensuing months the record of normal and actual rainfall and temperature follows:

Temperature—Degrees Fahrenheit	April	May	June
17 year average	41.2	55.4	59
1921	48.5	66.7	76.8

Rainfall—Inches	April	May	June
17 year average	0.8	1.52	1.84
1921	0.027	0.012	0.2

India is the land in which the threat of famine is ever present. Her 300,000,000 population live literally from hand to mouth, yet the British rulers have never seriously attempted to build up grain reserves against the constantly recurring years of need. Experience seems never to count against administrative red-tape incompetence. This past year saw more than 2,000 square miles of Bengal laid waste and its hundreds of villages destroyed because a new railroad embankment was built athwart the country, and, despite numerous native warnings and protests, with too narrow openings for the inevitable run-off of the monsoon rains.

With the coming of May the Indian Ocean develops temperatures higher than the land, and pressure throws vast bodies of humid air over India, beginning with the southwest monsoon which drives against the Himalayan slopes and floods the land with rain, running from the world's record at Cherra Punji in the Khasi Hills of 464 inches a year down to the bare requirement of 20 inches from Delhi to Peshawar. Not until a ring of weather stations has been established in the antarctic will the forecast of the monsoon failures be definitely established, but somewhere in that land of frozen mystery lies the secret.

The Austral winter is coming on. Assume one of unusual severity and prematurity, it would tend to draw strong equatorial air currents from the India front to fill its vast contracting Low and thus weaken the monsoon to the point of failure. This would be especially true if a warm and early arctic summer lessened the ability of Siberia to draw air across the Tibetan plateau, thereby encouraging the building up of the India Low.

India has witnessed 23 severe famines since the British occupancy, the one of 1769 being the worst. Ten million wretches lost their lives directly from starvation, while other millions died in the aftermath of resulting disease. A thousand square miles of closely cultivated land reverted to the jungle.

The great typical famine of all time was that of Egypt, told in the forty-first chapter of Genesis. As far as its chronicler knew, it was world-wide. The Nile then as now drew its overflow from the Abyssinian watershed. While its permanent flow comes from Lake Albert Nyanza and Lake Victoria Nyanza, fed by 10 months' annual rainfall under the equator, Sir Samuel Baker in 1861 proved that the floods of the Atbara and Blue Nile from June to September gave the overflow and that the Atbara brought the fertilizing silt.

There have been many other Egyptian famines due to the failure of the Nile. One of seven years' duration occurred under the Ptolemies, about 200 B. C. Another is recorded on a granite monument in the Island of Sehel at the first cataract. Arab writers note one of seven years from 1064 to 1071 A. D., in which the starving people resorted to cannibalism, and still another of two years from 1200 to 1202 A. D. Pliny refers to one which took place during the reign of Trajan. The famine of 1064-71 corresponds in time with three extremely cold years which visited Europe.

But the deep lesson of the Egyptian famine lies in the wisdom which led to the storage of grain against the coming of the seven years of drought and crop failure, enough not only to supply the needs of Egypt but to sell to the surrounding countries. And a great warning is read to the peoples of today against that high finance which banked on the direst of human needs and gathered in all the money, all the livestock and finally the land itself. Read the story:

"And Joseph said unto Pharaoh: 'Behold, there come seven years of great plenty throughout all the land of Egypt; and there shall arise after them seven years of famine, and the famine shall consume the land . . . . Let Pharaoh . . . . appoint overseers over the land, and take up the fifth part of the land of Egypt in the seven plenteous years. And let them gather all the food of the good years that come . . . . And the food shall be for a store to the land against the seven years of famine . . . . And he gathered up all the food of the seven years which were in the land of Egypt.

"And the seven years of famine began to come . . . . and there was famine in all lands; but in all the land of Egypt there was bread . . . . And all countries came into Egypt to Joseph to buy grain, because the famine was sore in all the earth.

"And Joseph gathered up all the money that was found in the land of Egypt, and in the land of Canaan, for the grain which they bought . . . . and Joseph gave them bread in exchange for the horses, and for the flocks, and for the herds, and for the asses . . . . And when that year was ended, they came unto him and said . . . . buy us and our land for bread and we and our land will be servants unto Pharaoh . . . . and the land became Pharaoh's."

The concluding article will present the storage of wheat as a development of modern insurance, entirely in line with sound economic progress; will show that the stabilization of price is also in line with present practice, illustrated in numerous directions, and means economy and lowering of costs. Finally the plight of the grain raisers and the farming community generally is brought home conclusively in justification of the government's entering this field of conservation.

Players' Pranks No Longer Part of Baseball

Concluded from page 10

the snipe and chase them into the open sacks. Snipe always sought refuge in empty sacks.

As soon as the victims were desirably placed the promoters would vanish. The automobile was always stationed far enough away so that the recruits could not hear the engine as the veteran players, with their lanterns, left for town. This they did quietly, peacefully.

The victims would hold the sacks until suspicion got the better of them. Sometimes they held the sacks until dawn, waiting for the scared snipe. If they decided that the hunt did not promise much success and sought their companions the trouble was on. Stranded in a strange woods, far from the main road, completely lost, the recruits invariably were compelled to wait until daybreak to find their way back.

Veteran pitchers always took keen delight in working one joke on the young aspirants for pitching jobs. Some of the recruits had never slept in a Pullman. The veterans would take the youngsters aside and give them much advice. One secret of success was taking care of pitching arms. Properly to care for the arm the veterans had a secret which few knew. It was a simple plan but it was the reason for the success of every star pitcher. So they said.

The veterans worked on the curiosity of the recruits; finally they were induced to divulge their secret. After swearing the recruit to eternal secrecy the veteran would confide that his success was due to resting his pitching arm in the "hammock" of the Pullman berth. Many restless nights were spent by recruit pitchers who tried to keep their arms in the "hammocks" and some developed stiff and sore arms as a result and failed to show enough ability to win a job, which did not worry the practical jokers.

Another time-honored joke was that of holding the lantern. Ball clubs generally have two Pullman coaches. These are hooked to the rear of the train. The joke can be worked only on the rear car and this is generally the one to which the recruits are assigned.

The recruits were told that major league clubs feared more than anything else a train wreck. To prevent rear-end collisions the clubs always selected one player to do sentry duty on the rear platform. The player sat on the rear platform all night with a lantern. He was to swing the lantern and warn the engineer of any train that might approach from the rear. It was exacting and only players who were mentally alert could be trusted. As a matter of fact, the recruits were told, several major league stars owed their positions to the showing they made holding the red lantern. Several train wrecks were prevented and managers figured that any player who is alert enough to prevent a train wreck is alert enough to hold a job in the major leagues. So the recruits were told—and many believed.

Young men have sat on the rear platform all night, peering into the darkness as the train rolled on. They firmly clasped red lanterns and prayed they might save the train and become famous.

This joke was really dangerous. Several players narrowly escaped death when sleep overcame them while on sentry duty. Managers always tried to prevent this prank. Railroads also forbade their train crews furnishing red lanterns to ball players but in spite of all precautions the joke continued until recent years.

Also, inducing a pitcher to write a patent medicine firm, asking for fast-ball oil, was a favorite trick. Players who wanted to become great batsmen were inveigled into spending certain sums for "home run" bats, made by a certain factory and guaranteed to deliver a certain number of home runs each season. Nearly all players believe that certain bats "hold" a certain number of hits.

These pranks no longer form the side show of the major league training season. The player today is a business man. He has the money end of the game uppermost in mind. He attends strictly to business and playing practical jokes is not business; that is merely a waste of time.

Another reason for cancelling the jokes is that they were becoming too well known. The badger fight has become so widely advertised that finding victims among the sophisticated recruits that now come to the training camps would be difficult. However, it would be a simple thing to substitute new jokes. This is not being done. Jokes are passé in this business age of baseball. The dollar is the thing

If You Go to Mercer You Must Learn "News"

Georgia University, Nearly 100 Years Old, Makes Journalism Compulsory

By CLAIRE GILES

GEORGE M. SPARKS.

Practical newspaperman for eight years, now teaching college men to be the same.

WITNESS the passing of a picturesque figure of familiar fiction—the cub reporter, who, starting out uneducated and untrained, by virtue of a certain imperviousness to hard knocks and hard-boiled city editors, finally ascended the ladder of newspaperdom to the editor-in-chief's chair, where he benignantly heaped coals of fire on the heads of his former persecutors.

Yes, he's gone for good. A southern university has sounded his death knell. In the ranks of the ultra-conservative a precedent has been established—a university president discovered that a knowledge of the writing game is as necessary to a boy's education as mathematics and history and the dead languages; that there is a very definite "tie-up" between journalism and a university student's preparation for his life work. So he established a school of journalism and made it compulsory. Mercer University at Macon, Georgia—nearly 100 years old—is the only college in the world where journalism is compulsory.

You can see the erstwhile cub reporter's prototype most any day around town in Macon, his orange-and-black skull cap bobbing in and out among the crowds, or where there is something likely to be happening.

Maconites have come to know and love him—to answer frankly his impertinent questions and to look with a kindly tolerance on his eager interest in matters seemingly trivial. True, he is rather numerous, but always interesting. Besides, it is rather fun to help him get his news story, and then watch for it in one of the local dailies or in the columns of the *Mercer Cluster,* the eight-page college weekly.

When President Weaver established the School of Journalism in 1920—the third year of his administration—he selected an experienced newspaperman as the logical head of the department, making him also publicity director. You see, the president once served a newspaper apprenticeship (even now he carries a membership card in the Typographical Union), hence knew instinctively that the best way for a small university to become a great one was NOT to hide its light under a bushel. Since he came to Mercer, she has been constantly in the public eye. Neither her alumni nor her benefactors, her competitors nor the public at large have been allowed to forget for one moment that she is on the map and going strong. The publicity department has maintained a regular news correspondence to all the principal dailies in the state, chronicling the news, academic, athletic and social, especially to those towns from which Mercer students have matriculated.

For instance, Tom Jones, of Podunk, Georgia, wins in a debate—not a matter to create a great flurry at the university, where there are so many other activities, but of great interest (naturally) to Tommy's parents and his former schoolmates at Podunk. So! the "news hounds" get busy and send a news item to the *Podunk Weekly*—or maybe it is the county semi-weekly—reading like this: "THOMAS JONES CARRIES OFF DEBATING HONORS AT MERCER." Result: Tommy's parents are proud and the whole town has a new interest.

The boys get actual, practical training in being "news hounds" through assignments from the local newspapers (in addition to lectures from local newspapermen). They learn to know what is news and what isn't, what is legitimate to print and what is not by a comparative study of the leading dailies of the country. They contribute all the college news to the local papers, and get out the *Mercer Cluster,* a weekly eight-page newspaper covering all the news of interest to and concerning the 14 secondary schools and colleges that compose the Mercer System.

How many would know, for instance, that the last edition of "WHO'S WHO IN AMERICA" contained 17 names of Macon people, 13 of whom were Mercer faculty members, if the "news hounds" did not dig it up and spread it broadcast? Or that the present governor of Georgia and the editorial writer of one of Georgia's biggest newspapers are Mercer graduates? Or that the highest-paid writer of a single short story in Georgia is a Mercer alumnus? That the founder of Baylor University, and the former president of the largest Protestant convention ever held in the United States were Mercer alumni? That Mercer had at one time as its graduates governors of Georgia, Florida and Alabama, and half the Congressmen from Georgia? Or that the oldest alumnus of any college, now living, is a Mercer graduate, and that one of the first physical tests confirming the fact that the world is round was made at Mercer by one of the professors. And so on.

The technical work includes courses in reporting, editing, the history of journalism, business management, the country newspaper, the writing of editorials and special feature articles, publicity campaigns, and the principles and psychology of advertising. And, so that the student shall bring to the practical task of newspaper making not only a trained mind and the necessary technical instruction, but broad human sympathies and understanding, he is required to familiarize himself with social, political and economic conditions by choosing courses in history, economics, sociology, philosophy and literature.

So much for the passing of the cub reporter—a lovable chap, too, with his audacity and freckles. But fictionists may weep and city editors rejoice, for the system works! University students learn journalism just like they learn any other required subject.

Even the faculty at Mercer are drilled in the acquisition of a "news sense," and the value of publicity. Dr. Weaver tells his faculty that they must not "live on the campus, and feel bound by tradition to mold in the musty atmosphere of academic life; that they must get out and form contacts with people outside the college, get their viewpoints, and cultivate fresh interests." He tells them that he wants every member of the faculty to do something "different"—something that will interest outsiders and that is a logical excuse for getting into print.

"Perhaps you did not know," said the professor of Theory and Practice of Journalism, a newspaperman of experience, "that we go back to the Bible for our journalistic standards. The greatest newspaper lead that was ever written is in the Bible: 'In the Beginning, God.' These four words tell who, when, where, what, why and how, thereby conforming to the first newspaper requirement to 'tell your story in your leads.' The greatest story in the world—the story of creation—is told in less than 900 words. The greatest 'human interest' story ever written is in the Bible. It is the story of the Crucifixion, and a whole human drama is told in 200 or 300 words. Luke was the great newspaperman of the Bible, and might be likened unto a modern city editor, drawing to himself three good reporters in Matthew, Mark and John. Luke had by far the greatest 'news style.'"

Mercer University, founded nearly 100 years ago by Jesse Mercer and located at Penfield, Georgia, is a denominational university including a Baptist Theological College. Its former presidents include a long list of illustrious Baptist ministers and laymen. Dr. Rufus W. Weaver, now president, is a Baptist minister of wide culture and a practical viewpoint. When he became president, Mercer was $240.000 in debt and running at a deficit. In four years, with twice the equipment and three times the faculty, the endowment has been restored to $750,000, and it is showing a net gain over running expenses of $10,000 to $12,000 a year. This has been accomplished largely by "telling them about it" in the press, hence Dr. Weaver has a great respect for printers' ink. He believes that no man who expects to take his place in public life has properly fitted himself until he has mastered the technique of writing, and is familiar with the avenues and usages for making himself heard in print. He says:

"The old idea that the student existed to shed glory on the institution is erroneous. The institution exists for the student. Seeking a way in which the curriculum at Mercer could be made to turn out graduates who are better rounded characters, and not only instill in them Christian principles but high ideals of service that will stay by them through life and endow them better to cope with the moral, ethical and financial problems they will have to face on leaving college, I decided that journalism was one of the most important branches of study—and one most commonly neglected.

"Mere scholarliness will no longer suffice—the regular academic course in English and literature will not fill the bill. Public men and leaders must rise to the changing standards of the age and meet popular demand on its own terms. If our leaders in politics and law and sociology and economics are to be heard above the clamor of skepticism and doubting, they must not only arm themselves with convincing proofs but they must know the most effective way to present them. No possible avenue for expression should be overlooked. A comprehensive course in journalism with correlative subjects will teach them this."

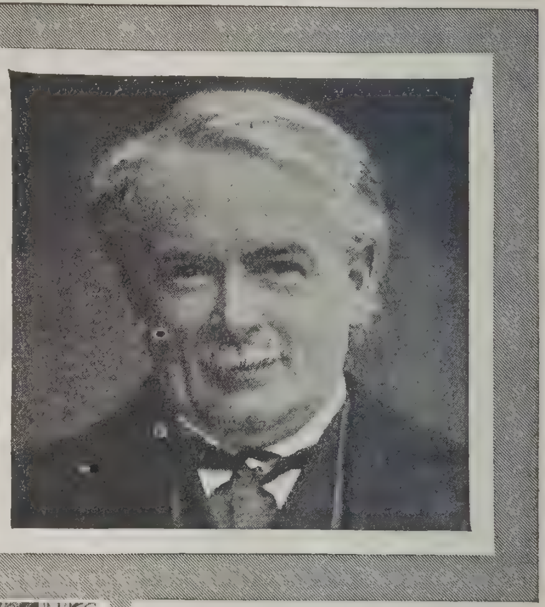
Above—DR. RUFUS W. WEAVER, president of Mercer University. Below—Mercer University's sky line.

Lloyd George Following Fades to Meager Few

Striking Feature of New Government in England Is That Labor Chiefs Have the Solid Backing of 142 Socialists

THE speed with which events are marching in England would make the American's head swim. A few short months ago Lloyd George was premier and virtual dictator with a strong coalition cabinet and a subservient parliament registering his will. His lease of power seemed intrenched and indefinite. Today, he has taken a back seat with a mixed and meager following that obtained only fourth place—a sort of "also ran"—in the general elections race; a bodyguard of such incoherent and uncertain elements that it hardly attains the dignity of a political party, while Bonar Law is premier at the head of a reconstituted and compact Conservative party in office by virtue of a majority of 87 votes over all in a House of Commons containing 615 members.

First, as the result of a speech at the aristocratic Carlton Club, Lloyd George, probably the most popular idol and the most magnetic and brilliant political orator Britain has known in a generation, ceased to be head of the government and dictator of the destinies of the empire and that quiet-spoken and pipe-smoking Glasgow business man, Bonar Law, stepped into his place. The coalition government that had been in power for seven years was no more and the jingo parliament elected in 1918 to keep it in power under sway of the still hot war-time passion and on the fiery slogan, "We'll hang the kaiser and crush Germany," has passed into history. Lloyd George was forced to resign, Parliament was dissolved and an almost immediate general election called to give the new government a mandate or to vindicate Lloyd George and return him to power. This half of the change took place almost over night. Within the following fortnight the country passed through an electoral campaign that came as near to being exciting as anything of the sort that has ever happened in this tight little isle.



LLOYD GEORGE,
Ex-premier and leader of the National Liberal party.

House of Commons. Below—MR. BONAR LAW, Prime Minister of England and Conservative party leader.

In the days since Bonar Law kissed hands at Buckingham Palace on his appointment as prime minister and Lord Privy Seal, more than 1,500 candidates for the 615 seats in the House of Commons were nominated and waged hot local battles assisted by the "Big Guns" touring the country and addressing hundreds of meetings in all parts. The very conservative London *Morning Post* speaks of it as a campaign "conducted on the whole with quiet dignity." But the things which Lloyd George and Winston Churchill have been saying about Herbert Asquith and Bonar Law, not to mention Lord Gladstone and Lord Birkenhead, and these about Mr. George and Mr. Churchill, and what both the old party speakers have been saying about the Labor candidates would have been regarded as decidedly "personal," to say the least, if they had been said in the course of a hotly contested American election. And the cartoons and the posters! Well, they were hot stuff and rough stuff.

Lloyd George within three days of his downfall started out on a speaking tour, "sword in hand," (only it was a club) with which he smashed right and left regardless of diplomatic amenities, storming the country as the head of a party all his own and called National Liberal (to distinguish it from the straight or Independent Liberals who had withdrawn from the coalition four years ago) and reinforced by a little band of coalition Conservatives headed by such former members of his cabinet as Austen Chamberlain, Winston Churchill and Lord Birkenhead. He broke all precedent in England by chartering a special train for his party of speakers and for a whole week firing the crowds at stations and from cinema platforms, waging a veritable "whirlwind campaign" that reminded one of Bryan and Roosevelt in their palmy prime. Elections were held in 557 constituencies, 58 members having returned unopposed, and within a week the 615 newly elected members came up to Westminster and were sworn in. Of this number, 122 are new men, and for the most part young men, and a score at least are men who had been more or less conspicuous as pacifists and had been swept off the stage in the avalanche of 1918.

This year's election has transformed the whole atmosphere of the British Parliament, and with it that of the country at large, while the actual "government" as constituted by Prime Minister Bonar Law and which includes nine of the men previously in Lloyd George's cabinet, remains unaltered, it has been put on a more permanent basis by the popular ratification. But the change in the composition of the House of Commons effected by the emergence of the Labor party as the second strongest party, so ranking as "His Majesty's Opposition," means nothing less than the achievement of a bloodless revolution—and one of far greater significance than the triumph of the Fascisti under Mussolini in Italy. Besides, it is a revolution in the opposite direction to that which Italy has just witnessed.

The British Labor party is a *Socialist* party. Its avowed aim and object is nothing less than a complete change in the existing social order by the steadily progressive socialization of industry: the establishment, that is, of public ownership and direction of the means of production and the distribution of wealth on a basis recognizing the worker's right to the fruit of his labor; this as a substitute for the present system of private ownership of capital and the appropriation by the capitalist of surplus values. It does not seek to make this change at one fell swoop, nor by any other method than that of peaceful and orderly constitutional agitation and education, issuing in parliamentary action. And the way things look now, while the party sticks to this program, there is nothing that can stop its arrival at this goal within measurable time. That is nothing but a counter-revolution by force on the Fascisti plan—which may be Italian, but is entirely foreign to the British psychology.

The tremendousness of this change, moreover, is emphasized by Labor's choice as leader of it. Ramsay MacDonald, an ardent and uncompromising Socialist with a solid block of 142 Socialist votes at his back, outnumbering the split fragments of the Liberal party put together, and with so able and tested a lieutenant as J. R. Clynes, MacDonald is sure to be a power to be reckoned with. Under the British parliamentary system, the "Opposition" plays a much more important part than that played by the minority party in our own Senate or House of Representatives. It is always an alternative government. Should the government actually in power be outvoted on any measure proposed by it, even with the help of disaffected members of its own party and of other minority parties, such a vote would be construed as a "vote of want of confidence." Constitutionally, and almost automatically, the "Leader of the Opposition" (in this instance Ramsay MacDonald) would succeed to the premiership and form an all-Labor cabinet. The legal government of the Kingdom of Britain would be Socialist.

Time was when such a situation as now exists would have aroused intense alarm among the "solid" people—the propertied and governing classes. In their eyes, it would have meant a "rocking of the empire to its foundations," a turning of the world upside down and a menace to our whole civilization. The prospect of an accession to power of the Socialists has until now been viewed with alarm as the imminent threat of "red revolution." The specter of "Bolshevism," indeed, was raised with a beating of the big drum and more or less ingenuously in the last few weeks by even that whilom radical, Lloyd George. It was shrieked by the erstwhile "Northcliffe" press, which urged that readers should vote even for Lloyd George's or Mr. Asquith's followers to beat Labor, if they could not stomach the Conservative platform or lack of platform. At a gathering of bankers, brokers and business men, Reginald McKenna, former chancellor of the exchequer and now head of a bank, squarely turned his back on the Liberal party with which he had been identified all his life and appealed to his hearers and to all British business men to support Bonar Law and the Conservative candidates as the nation's one hope of stemming the tide of Bolshevism and revolution. Mr. Asquith himself, while pooh-poohing the Bolshevist bogey and wittily sarcastic at the expense of McKenna and his fears, denouncing all that sort of thing, as an insult to the sterling character and intelligence of the British workman, centered his attack on the main plank in the Labor platform calling for a capital levy. He denounced it as a measure that would prove disastrous and confiscatory, destroying the last hope of a revival of British trade and industry, and so likely to increase and intensify unemployment.

Now that the accession of Labor to that second place, which in this country is always within hailing distance of first place, has become an accomplished fact, there is scarcely a fluttering among the dovecotes. It is suggested in many quarters that the capital levy may not prove so bad a thing after all—for the people not overburdened with capital—although it might be bad for the war profiteers. It is even pointed out that Lord Rosebery once gave axiomatic vogue to the idea traditional in English politics that nothing could be better for the government itself than to be faced by a really live, alert and aggressive Opposition, spurring it to be vigilant and active. The present Opposition, it is indicated, may happily force Mr. Bonar Law's administration to be actively and constructively progressive, rather than apathetic and retrograde.

Yet, it is certain that while fear of Socialism may have won many votes for Bonar Law, his famous declaration in favor of "tranquillity" won him even more. It was, of course, eagerly seized on by his opponents in both Liberal and Labor ranks as a fine subject for satire. But, exaggerated and distorted as it became in their handling, the declaration made strong appeal to many persons. Weariness and distrust of Lloyd George's pyrotechnics had become very general. His sudden somersaults, dramatic surprises and proneness to desperate adventures in foreign policy had begun to pall. The sober second thought of the Anglo-Saxon mind, revolting against a seemingly endless succession of crises that kept the country in turmoil at home and abroad and was wasting millions of money, while economic conditions went from bad to worse and a large proportion of the population was on the edge of starvation, was calling out, in Grant's famous phrase: *"Let us have peace!"* Thoughtful persons had become distinctly distrustful of the further possibilities of Lloyd George's Celtic temperament. Bonar Law would at least be safe and sane and give the country a rest.

But the enormous increase in the Labor vote in Parliament from 76 to 142 representatives was due principally to the acute and long-drawn-out distress caused by unemployment. Workingmen and women everywhere—outside of those under the traditional sway of the squirearchy in country districts, the small and large farmers and agricultural laborers, along with the small tradesmen and pensioners, parasites and hangers-on of the great landlords and moneyed aristocracy—cast their ballots for Labor. So the Labor party nearly doubled its representation in Parliament, casting a total of 4,191,732 votes for Labor candidates as against 5,464,707 polled by the Conservatives; 2,619,870 by the Independent (Asquith) Liberals, and 1,430,000 by the National (Lloyd George) Liberals, this last including many coalition Conservatives.

For more than two years, the unemployed have been receiving "doles" of public money, the taxation for which alone has been a serious drag on trade and industry, keeping up rents and the cost of living and, in numerous instances, not only retarding needed local public improvements, but actually causing the shutting down of factories, so increasing and intensifying the evil the dole system was devised to mitigate. Although the amount of the dole is scarcely sufficient to keep body and soul together and it has had so pauperizing and demoralizing an effect on the out-of-works that many of the more self-respecting have refused to apply for it until they had sold the last stick of furniture and almost the last stitch of clothing to buy food, some smug persons have complacently regarded it as a convenient salve to conscience. These comfortable folk usually regard the "working classes" in bulk as pestiferous fellows and stirrers up of strife, or lazy ne'er-do-wells reaping the fruits of their own thriftlessness and refusal to accept low wages. It is common to hear the rejoinder to a plea in behalf of the men who have been vainly demanding an interview with the Prime Minister that exceptional conditions of distress should entitle them to exceptional consideration: "They are not *starving;* they have the dole!"

The men themselves demand not doles but work—although if they are not to have work they call for an increase of the amount of the dole to make it equivalent to a living wage. All the party platforms ("manifestos" they call them in England) condemned the dole system; but only the Labor manifesto pointed out that the obvious remedy for the immediate situation, while pushing for a settlement of foreign affairs that should bring about the stabilization of the mark and restore foreign trade, must be the prosecution of productive and large-scale public works in the shape of railway extension and betterment, and of much-needed road and canal extension, as well as an intelligent building program which would at the same time relieve the scandalous house shortage.

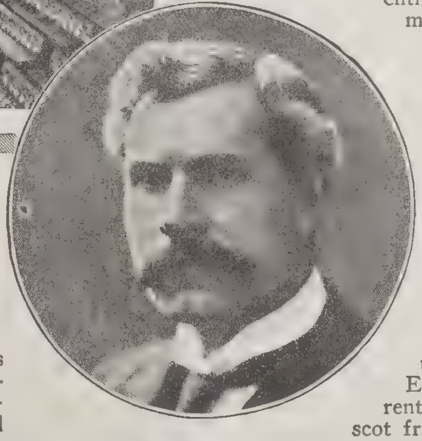
On the day before the opening of Parliament, a procession of the unemployed marched along the Thames embankment. There were nearly 40,000 men in line, about one-half of them crusaders from the provinces and the other half London men. Although they tried to make a brave show with their big red banners, their belligerent placards and drum and fife noises, the spectacle on the whole was sad and depressing. Those from outside had walked to the capital from all parts of the country to present to the government (like Coxey's army in 1894) a "petition in boots." Several of the detachments, like those from Dundee and Aberdeen, had come 400 miles afoot and been two or three months on the way. Not a few had been out of work for from 18 months to three years. They seemed half-starved, haggard, miserable and worn, in spite of the fact that many were ex-service men who with pitiable pride strove in their rags to preserve a tidy appearance. With all this, they were obviously of the peaceable, self-respecting British type, knowing their rights and determined to obtain them. Only a violent stretch of imagination could see in them "dangerous revolutionaries" and bomb throwers.

London is now laughing at the sensationalism of the *Pall Mall Gazette* and other London dailies which filled their front pages with stories under glaring headlines of "revelations" of a terrible plot. These miserable marchers were pictured as a lot of trained incendiaries, wild and desperate "reds" led by agents of Lenin and Trotzky and taking daily orders from Moscow. It was suggested that the plot was to raid and burn the houses of the nobility and aristocracy in the West End, blow up Buckingham Palace with the king and queen in it, then the government buildings in Whitehall and the Houses of Parliament. More or less color was given to the scare by the erection of barricades across St. James Park, Whitehall and Downing street and the doubling of military and police guards everywhere.

The night before the opening of Parliament, there was a crowded meeting of the Independent Labor party at Kingsway Hall. It was called to celebrate the victory of the newly elected members. But it turned out to be much more than that. It would be difficult to recall a political meeting anywhere in which the atmosphere was so deeply and humanly enthusiastic and at the same time pitched to an idealistic key bordering on the truly religious. Ramsay MacDonald was to have been the chief speaker, but was detained by a bad throat, and the chairman read a letter from him in which he declared that Labor should oppose the government "not as a small-minded faction, but as a body of men in possession of principles and policies which we believe will serve the interests of the nation as a whole much better than those professed by the gentlemen on the benches opposite to us."

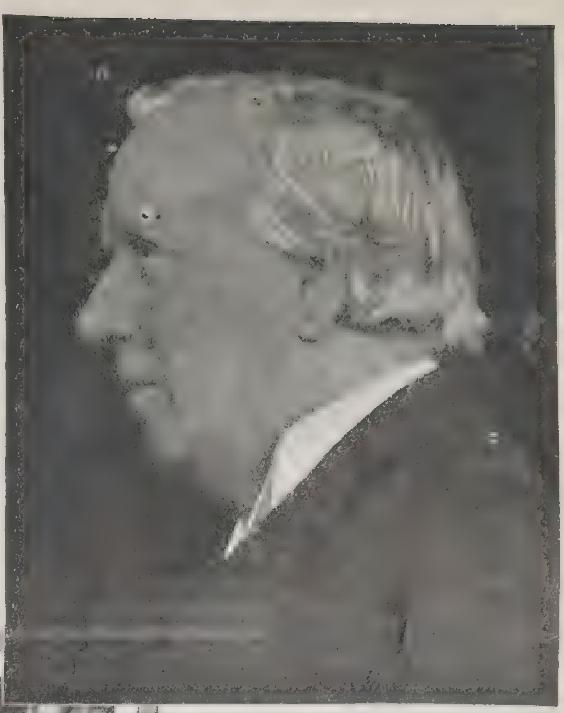
J. R. Clynes so sounded the keynote of closed ranks and a solidarity in the Socialist movement based on devotion to the common ideal that placed their cause far above all divisive personal or factional jealousies.

Continuing, he scored a decided hit when he spoke of the "last despairing effort" of Mr. Lloyd George in the campaign being an appeal to Labor to get rid of the intellectuals. "Evidently," remarked Mr. Clynes, "the ex-premier had been able to get along without intellect; but the Labor party found brains too useful in its business to think of dispensing with that element, and Labor can boast of attracting to its banner some of the finest men of the most varied experience in the country in forms of service."



Clynes and MacDonald photographs (C) C. Vandyk Ltd.

Above, at left—J. R. CLYNES, deputy leader of Labor party. Center—House of Lords. Below—RAMSAY MAC DONALD, leader of Labor party and possible next Prime Minister of England.



HERBERT H. ASQUITH.
Ex-premier and leader of Independent Liberal party.

The men on the platform and their speeches pushed home the conviction that the Labor leaders in the new Parliament are men of outstanding intellectual ability and high moral character; men who as parliamentary debaters and as serious students of economics, combined with the "varied practical experience" of which Clynes spoke, fit them for capable and valuable spade work in committee. Assuredly, Bonar Law, Lloyd George, Asquith, Chamberlain and the rest will find these Labor leaders foemen worthy of their steel.

There is probably no man alive who is a greater master of modern economic science based not on the historic theory alone but also on knowledge of the carefully verified facts of modern trade and industry than Sydney Webb. Then there is E. D. Morel, who defeated Winston Churchill in what he had regarded as his dead-sure district in Dundee. Morel is probably the best informed man in England on European affairs and colonial administration. Another Dundee district elected on the Labor ticket, J. E. Scrymegeour, the unique representative of prohibition in the House of Commons and who came to Westminster with a prohibition bill in his pocket. Another man to watch forge ahead is Major C. Atlee. In committee and on the floor of the House, he will prove himself a master of really sound finance in his advocacy of the tax on war profits, an amendment to the budget as an amendment to the budget which the Conservatives will bring in. R. L. Outhwaite is demanding the abolition of all taxation and the opening up of opportunity by the transfer of the entire unearned increment of land values from the pockets of parasites on the body politic to the public treasury for public use and benefit. How strange it is to find that in the present stress of public finances and the desperate hunt for things to tax and heap up taxes on in England (ground rents in Britain go scot free)! In all these lines, C. P. Trevelyan, one of Labor's most valuable recruits from the Liberal ranks, will prove a skilled and effective fighter. Clynes himself displayed an administrative ability which commanded the admiration of men of all parties during his service throughout the war, first as deputy to Lord Rhondda and later as his successor at the head of the ministry of food. And no man is more capable of rendering yeoman service in forcing the present government into some intelligent regard for the conditions of the common people and in training the Opposition party into fitness for taking over the government when the time comes. Throughout the meeting, there was evident a determination that the party should stand four-square in its adhesion to the traditional English regard for the spirit and the letter of the law.

Watered Housing: How Home Buyer Is Cheated

Concluded from page 2

scarcely a one of them ever erecting or selling a house or other building—none, so far as the past indicates, taking any serious risks of losing any money thus advanced—and you get some idea of the terrific levy the "financing" they engage in has made on housing under the singular conditions existing during the last few years. While it isn't the sole one, most students of the subject say that it is the chief precipitant of the vast volume of "water" which has been poured into the sales and renting values of city residential property in most cities of the United States during the last five years.

"I feel almost ashamed now when I sell a house on a purchase money note basis," declared one of the biggest builders in the country to the writer. "For with every two items of house I am delivering about one item of 'water,' that is, the prices are one-fourth to one-third higher than are justified by actual construction costs, or rather what they should be, on the basis of real values as compared with those of 10 years ago. This 'water' has been injected into every branch of the operation, from the sources of the materials to the delivery of the house to the purchaser. Everyone touching the operation is to blame for some of it, but the power of money, as wielded by persons who never saw an item of the material used nor took the slightest risk in the construction venture, is responsible for more of it than any other single factor. And it has been utterly unnecessary. For the first time in history, we have been through a long period when city homes that were promoted on anything like a sound basis would sell themselves. When promoted on a sound basis there is no reason why they should not have financed themselves, in spite of the uncertainty as to high prices for materials and labor continuing indefinitely. With every capable builder, profits on all undertakings have been absolutely certain. So there is every reason why prices for houses should have been above the pre-war level only to the extent of actual increases in the costs of materials and labor. Even then the promoters would have made more on each transaction than they used to, for the reason that they could have eliminated selling costs, which amount to about 10 per cent of sales prices. But inflation has set the keynote for operations. The ultimate cost of it may be terrific. It will fall most heavily on those persons who have mortgaged their incomes for years ahead to get what they think are permanent homes. What in too many cases I am afraid they actually have procured is a burden of debt and interest they can never get from under except at the risk of losing all the real money they are putting, for the time being, into 'water' values. For the 'water' in the average house now sold for from $10,000 to $14,000 will absorb the customary cash payment down, 10 per cent, as well as that portion of monthly payments which goes to principal for the first two to four years of 'ownership.' The only chance such buyers have is for inflation to continue indefinitely—but a glance into economic history will show that there is very little hope or danger of this occurring. "All of us are hastening the inevitable slump."

OF ILLINOIS URBANA ILL

BRIEFLY TOLD

A Hindu of high caste is not a "free white person" within the meaning of the naturalization law, and, therefore, is not entitled to citizenship, according to a ruling of the Supreme Court. The court ruled that the words "white person" must be given the meaning they have in common usage. Even though the Hindu in question was a descendant of the Aryans of India it availed him nothing as the new construction narrows the Caucasian race to those who are today commonly known by that designation.

A bill passed in Indiana provides for imprisonment from one to two years upon conviction of illegally transporting liquor in any automobile, aircraft, buggy or wagon. This will discourage driving by drunken motorists.

Violation of the Eighteenth Amendment cost a native of Finland the right to American citizenship in Federal District Court in Spokane, Washington. When he admitted he made whisky at one time the judge replied, "Application denied, I will admit no one to citizenship in this court who, by his own statements, has thus knowingly violated the Constitution which he must swear to uphold."

The public schools of Wyoming will honor the memory of W. F. Cody (Buffalo Bill) each year on February 26, his birthday anniversary.

The experiment of motion pictures on railroad trains to relieve the tedium of travel was tried out by a railroad running into Chicago. The screen was hung from one end of a day coach high enough to permit passengers to walk through the train.

The lighthouse keeper on Triple Island, British Columbia, died January 31 and for 20 days his wife and two daughters manned the lights, and the warnings of blizzard and fog were sounded with the regularity of a fully manned lighthouse. Triple Island light is one of the most important navigation marks on the Pacific Coast.

There are 14,000,000 foreign-born now living in the United States, half of whom are not citizens.

Governor Smith, of New York State, proposes that the state exempt the small-salaried man from the state income so that he may not be deprived of a full opportunity to use all his earnings for the education and promotion of health and safety of his family. Governor Smith classifies a "small-salaried man" as one who receives less than $5,000 a year.

When a whale is captured an instrument like a gigantic hypodermic syringe is inserted into the dead body and air is pumped in until the whale floats. Then, if other whales are about, a flag is stuck in the blubber and the quarry cast adrift; a fresh line is coiled and the chase begins afresh. The harpoon is shot from a gun.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Pigeons are being used in the national forests in fire control work. The birds are taken to the scene of a fire by the ranger and are then used to carry a report to headquarters which gives the actual location of and condition at the fire. In a test in the Idaho National Forest, carrier pigeons were flown from 17 different lightning fires and in every case each bird made a successful return with the message it carried.

Navigation from Winnipeg to Fort Churchill on Hudson Bay may be made a commercial success. Officials of the Hudson's Bay Company in Winnipeg propose to charter a Canadian Pacific steamer for a trial trip this summer.

George W. Wickersham, former Attorney-General of the United States, believes that women who cling to their maiden names after marriage are misguided. He says, "I am firmly convinced that nothing more mistaken was ever advocated. Fortunately I was born in a generation whose women thought it a glory to take their husband's name when they were married."

The author of the song, "The Sidewalks of New York," 70 years old and blind, is going back on the stage to sing the song he wrote 25 years ago. The song has become very popular once more in New York City and there is a demand for the author's reappearance.

Trial of several Eskimos under white man's law on a charge of murder will take place at Herschel Island in the Arctic Ocean near the mouth of the Mackenzie River. A captain and a corporal of the Mounted Police will make the final dash up the Porcupine and Crow rivers, across the arctic divide, then through the timber limits to Tundra, and finally to Herschel. A bill passed in the Federal House at Ottawa provides for the trial at Herschel instead of taking the prisoners out to civilization. In all probability it will take the form of a drum-head court-martial, with the redcoats as the court of last appeal.

The silk spinning industry of Kashmir is a government monopoly and defrays a large portion of the expense of maintaining the government. Kashmir is a part of Northern India.

An entire village in Quebec province will be either demolished or removed to another location for the great reservoir resulting from the construction of a dam on the Chicoutimi and Sable rivers at Kenogami. The village consists of a pretty parish church, school, public and private buildings, stores and residences.

Thousands of children down to the age of eight or nine are employed in the cotton mills of Shanghai, China. Little girls stand between double rows of whizzing, unguarded machinery, steadily but wearily feeding the machines.

Poor spelling, even among the well-educated, is due largely to poor eyesight in the early life of the individual. To spell correctly is truthfully to recall sizes and shapes which were photographed upon the brain through the eyes. If the eyes have not photographed a perfect likeness of the word or words, your knowledge is incorrect and the word is often misspelled.

New York State led in the total production of apples last year. Washington was first in commercial output. Each of these states produces more apples than any other two combined.

The Temple of the Moon, the home of the patriarch Abraham, recently uncovered in the Chaldees, may be between 6,000 and 7,000 years old. It is probably the oldest known edifice. The British Museum and the Museum of the University of Pennsylvania have charge of the research work in this section.

Alice Robertson, retiring Congresswoman, closed her congressional career by saying: "I want to go home as soon as possible. I am going back to my old arm chair, in the garden where the flowers will be blooming, to listen to the mockingbirds and at dusk, out over the wide prairie, to watch the twinkling lights in the southwestern oil fields—just to rest and think, for the twilight of life is a time for reverie and remembrance. No, public life is not the highest career of a woman. Her happiest place is in the home."

PROPAGANDA OR FACTS?

The world today is flooded with propaganda. There is a scarcity of facts. Pick up a magazine or newspaper and glance through it. Aside from local news—how much dependable information do you find?

Job Holders Suffer—So Nothing's Done

CHRONICLER OF THE NEGLECTED TRUTH

Job Holders Will Suffer—So Nothing's Done!

Establishing Anything in Government Simply Means It Remains

By AARON HARDY ULM

AT THE Bureau of Printing and Engraving in Washington, paper money and postage stamps still are printed on the kind of presses that were used 50 years ago and even longer. They are "hand" presses. Each will hold only one small plate of the size of a full sheet of postage stamps. Each requires the attendance of two persons whose output is insignificant compared to that of two workers who have the aid of a modern power press.

The only improvement made in the process of printing money occurred a few years ago when the plate presses were motorized. Prior to that time the muscles of the pressman supplied the energy that moved the mechanism of the machinery. Even that change had to overcome much opposition and would not have been permitted but for the fact that a growing number of pressmen were losing their health because of the strain due to turning the big machinery by hand.

For 25 years or more efforts have been made to put in modern machinery to take the place of the "hand" presses. Every such effort has been met by a positive requirement of law that no other kind be used for the purpose in question.

Congress repeatedly has refused to repeal the law.

Why? There is no question about it. The answer is jobs. Modern machinery would reduce, at least temporarily, the number of plate pressmen needed for doing the work turned out from the antiquated "hand" presses.

It has been proved that power presses can be used. During the war emergency they were used for printing the "backs" of bills. Expert mechanics in the bureau have designed a cylinder press which will and has produced postage stamps at a cost much below that for those turned out in the old way. With it two men can do the work of two or three dozen at the "hand" presses. Besides, it merges three operations into one. It not only prints the stamps but also gums and perforates them, which, when the printing is done on the "hand" presses, requires the passing of the stamps through two other machines.

This illustration is set forth out of no desire to criticize the governmental establishment in question. It is selected, rather, for the reason that for true efficiency and economical management the establishment ranks perhaps first among all that are operated by the National Government. In many respects it is a model that might be studied profitably by private manufacturers.

The illustration merely shows the sheer power of the job, any job, in its insistence on continuance, uninterrupted and undisturbed, when once created and established by government, and especially the National Government.

It is a characteristic of popular government—this augmentation of the public employe. It is pointed out by nearly all students of democracy, most positively by its friends, that one of the greatest dangers to popular government is the multiplication of public officials and employes to an extent beyond the power of the community to support them. Our history, and most especially that of recent years, shows that we are not avoiding this danger which had much to do with wrecking great republics in the past—and right now is making tragic farces of several set up as the result of the war.

What It Means Today

THE growth in the number of public job holders in the United States has been four or five times as fast as growth in population, which growth, of course, has been phenomenal. Today more than a half-million persons, outside of the Army and Navy, are on the pay rolls of the Federal Government. The civil employes of the government in Washington alone are now about 30 per cent more numerous than prior to our entrance into the World War. But for the partial decentralization of the government's Washington activities the increase there would be larger. This decentralization, made necessary largely by the unwieldly mass of employes, tends toward another trend that is characteristic of big republics—the setting up of additional national capitals or sub-capitals. With our Federal Reserve cities for national finance, our regional cities for the organized army forces, our district organizations for the work of the Veterans' Bureau and the Internal Revenue Bureau—all following largely the same geographical outlines—we are beginning perceptibly to divide the country into provinces very much like those which made up the Roman Empire. But that is another story.

The persons directly on the pay rolls by no means include all whose wages or salaries do not come, wholly or in part, out of the Treasury of the United States. There are many thousands, like those in so-called agricultural extension work, who, while nominally on the pay rolls of states or counties, are paid in part by the National Government. There are other thousands employed by persons or concerns doing work by contract for the government. Including those in the Army and Navy and those indirectly paid out of the Federal Treasury, it is probable that, in strict truth, not fewer than a million persons are on the employment pay rolls of or made possible by the Federal Government. This doesn't include several hundred thousand outright pensioners, or what is tantamount to the support—at a cost of $2,000 a year each—of a half-million persons or families by interest paid on the national debt.

Let us pass by all of the others and consider here only those who are paid ostensibly for their time, that is for work done—or not done—day by day.

They would populate a city of the present size of San Francisco, Buffalo or Pittsburgh. With their families—that is those whom they take care of on their wages or salaries—the number would be nearly as great as the population of Chicago, the second largest city in the country. It would be larger than the population of any one of 30 of the states and greater than the combined populations of the seven states having the smallest number of inhabitants.

Is the Federal Government rendering services which justify the employment—if we consider the directly employed alone—or the support via employment—if we consider their dependents as well—of such a vast number of persons? There is at least considerable room for doubt.

The late Senator Nelson A. Aldrich, whatever his political and personal predilections, was one of the best informed men on the operations of the government that have ever lived. When the government was costing only about one billion a year, or only one-fourth as much as at present, he declared that a capable business man could have done everything it did and save $300,000,000 of the expense.

The reason was the multiplication of jobs; frequently too many persons employed for the work done, too much work that involved the rendering of no worthwhile service; too many sinecures.

If what he said then was true, similar management could now save close to a billion dollars a year to the taxpayers.

The cost isn't the worst part of the building up of an excess number of public jobs.

They All Do Something

WHEN one makes careful examination of the facts one finds no great proportion of Federal Government positions that are pure sinecures. There are some, even many more than there should be. But there are comparatively mighty few persons on Uncle Sam's pay roll who do nothing in return for the money they get. Considered merely by volume, the vast majority of government workers do about as much as like workers do in private business or industry. That is, for illustration, the average government stenographer writes about as many letters and probably writes them somewhat better than the average stenographer in private employment. The average government executive sticks to his desk about as faithfully as the average executive in general industry.

The physical volume of work done sometimes by persons on jobs set up for scarcely any other reason but to attach those persons to the public pay roll is astounding. There lies before the writer as this is written a report made by a commission which was created, or manned, several years ago for the benefit of several popular "lame duck" Congressmen. It shows that a tremendous amount of work was done by that commission.

The controlling fact in the matter, however, is that similar work had been done already by others and probably better. This duplication by the "lame duck" commission merely confused the subject; in fact, so much that despite the great amount of money spent upon its treatment its condition now is about as confused as when the subject was first taken up.

Thus work that is done by public job holders often causes more harm than good. This is certainly true of the large extent in which the same work is duplicated by different agencies of the Federal Government. A recent inquiry into the gathering of statistical data by the government—on the whole a very excellent work—showed, for example, not fewer than 11 agencies collecting statistics on occupations, wages and hours of labor. Not fewer than 10 gather figures on commodity prices. Even admitting that all that statistical work is justified *per se* the distribution of it is necessarily so confused that the public cannot get full benefit from it.

But you would have great trouble in getting one agency to abandon or to surrender its statistical work to another. When those running a certain bureau—a statistical one by the way—voluntarily agreed to be absorbed by another a few years ago, the act was noted as almost unprecedented.

"Does your kind of job call for much work?" a newly established government official once was asked.

"No; not after you get it," he replied, with a blending of humor and fact.

It isn't easy to get a new job or establishment created in the government. Ordinarily, some "watch dog of the Treasury" is on the lookout and ready to protest and at least cause delay.

It isn't, primarily, the easiness with which new jobs or new governmental agencies may be set up that accounts for the exorbitant number in existence. It is the difficulty, almost the impossibility, of ever getting one abolished once it is set up.

This is shown by the numerical status of government jobs following all our wars. D. F. Houston, former Secretary of the Treasury, pointed out a year or two ago that history shows that every war we have engaged in was followed by at least the doubling of peace-time cost of the National Government. Much of that, of course, is due to interest on war debts and such expenses as pensions to those disabled in the war. But by no means all is accounted for by such items. A very large part of it is traceable to the difficulty in abolishing positions set up temporarily for the war emergency.

You may find examples of that throughout the Federal Government today. During the Civil War, for example, an office was set up for handling copies of war contracts. It still is in existence, or was a short time ago. Most of the establishments set up out of passing need during the World War still exist in at least rudimentary form. Large measures of the expansions made in old establishments for temporary war need still prevail.

One of the hardest after-the-war jobs that employing officers in the departments have had to perform is the getting rid of no longer needed "war workers." Once when one notified 300 clerks that their services were no longer necessary, he arranged for a record to be kept of all the protests and appeals on behalf of affected individuals that came in. In one day there were 170 from Representatives and Senators alone.

Many, of course, were made with Pickwickian reservation, just to please and to retain the friendship of the discharged employe and his or her relatives and friends back home. But in nearly every governmental establishment there are persons who have to be retained, regardless of what they do or the need for it, on account of "pull" they can command.

There is a certain government establishment that has good repute for efficiency. It has to do chiefly with keeping other establishments efficient. Hence it has many enemies. Frequently some of them threaten to have it abolished.

"Let us see you do it," reply those in charge. It isn't an egotistical or idle boast, or in any way based on the establishment's good repute for efficient work. It is solely on the knowledge that, once established, a resourceful occupant of a government job, or skillful operators of an establishment, can block, almost invincibly, any move to have the job or the establishment abolished. Usually they can block all but supreme efforts in the direction of greater efficiency or economy.

For a dozen years efforts have been under way to reorganize the governmental departments and to reclassify governmental positions. The piecemeal way the departments and bureaus have developed into their present huge sizes necessarily has caused them to be saturated with wasteful anomalies and confusions and cross-purposes, even on the basis that all their operations have sound merit. It is even worse as to the government employe. There is much disparity in the wages paid for the same or the same grade of work, all kinds of confusion as to titles borne by workers and also as to the definition of their duties; as well as to standards of capability.

Yet, beyond numerous reports and legislative bills, nothing has been done, and there is little prospect that anything soon will be done.

Job Holders Will Suffer

AND one, if not the chief, underlying reason why nothing has been done is that reorganization and reclassification mean that jobs here and there and job holders here and there will suffer by the change. Yet none of the reorganization schemes so far proposed provides for the abandonment of any work now carried on. None of the reclassification proposals fail to comprehend better pay and juster treatment all around for the great bulk of employes. But some existing agencies will be consolidated with others, resulting in the abolishment of some high-sounding titles without usually affecting pay or work. Forces in some instances will be reduced and in others increased and the salaries of the few who actually are overpaid will be cut. Thus in the aggregate a great many individuals will be affected adversely, though the great majority of those involved will be benefited. Those who will suffer are, as a rule, naturally against any change. And they have friends with great power.

They have great power because when it comes to undoing something one man in the House or Senate, and sometimes one man in the executive department, may force at least indefinite delay and often prevent action being taken at any time.

And he can rely for protection on the public's almost invariable indifference to what might be termed the repeal of laws. Laws once enacted rarely are repealed or modified; they only are added to or let alone. The demand always is for more law; rarely for less. This well serves the job holder who may have a selfish interest in preventing the repeal or modification of a law. That may be illustrated by an adverse example. There is on the Federal statute books a law that was passed just 50 years ago. It establishes and supports no jobs. No affirmative effort ever has been made to enforce it. So far as investigators can find no one has ever been prosecuted for its violation; yet it has been and is continuously and more or less openly violated.

But when persons favoring its repeal sought to get someone in the House or Senate to introduce a repealing bill they had to interview almost the entire membership of the two bodies before they found anyone who would do so. And scarcely a one interviewed failed to express an opinion favorable to its repeal.

There were other reasons for reluctance to lead the fight for repeal but a mighty one no doubt was the fact that repealing or modifying a law generally is a thankless task.

Several new types of specializing statesmen some day may come forth. One will be that of a man who as a member of the House or Senate will stand like a stone wall against the unanimous consent and legislative courtesy rules that have come to dominate national legislation. But that also is another story—and, I believe, a very interesting one; for it involves the possibility of a parliamentary revolution that would affect tremendously every phase of government as we have it. The other will be one who will stand for nothing but the repeal of laws and fight regularly and persistently for that. To make any great headway he will have to concentrate on that alone. But when the right man arrives there will be awaiting him a job which, if sanely performed, will comprise a contribution to statesmanship beyond that made as yet by any man of modern times.

Tong Wars on Increase Along West Coast

Revolvers of Organized Gunmen Settle Disputes—American Laws Scorned

It is a strange situation on our West coast that is taken up in this and a second article, dealing as they do with conditions apparently incapable of solution by the law authorities with which the warfare of Chinese tongs comes into contact.

By HELEN PUTNAM VAN SICKLEN

WHILE some condemn and others condone, all seem to agree, despite the earnest efforts to abolish tong warfare, that Chinese highbinder tong activities are steadily increasing. My best-known authority is Ng Poon Chew, historian, lecturer, and editor of the San Francisco daily, *Chung Sai Yat Po.* He estimates that at least *90 per cent of the Chinese in the United States pay indirectly, if not directly, to the tongs for personal and business protection.*

It is a strange condition, having no exact parallel, even in China, that exists in our western states. Tong wars cost thousands upon thousands of dollars annually in lost revenue from trade and constructive production and hundreds of Chinamen lie hidden from danger until new peace pacts replace those broken but a short time before. And what is all the more strange is that the organizations of Chinese that became engaged in deadly conflict operate under the misleading titles of benevolent and protective associations, and as such, are chartered as non-profit corporations under the laws of California.

The Chinese General Peace Association Building, San Francisco.

Tong warfare has its peaceful respites and truces, but usually of such short duration as to be of negligible importance. For no sooner is a "lasting and final peace" signed in one quarter, than trouble flares in another. A cheated gambler, or a stolen slave girl; there is a ripple of excitement among the Orientals, a paragraph or two in the American press and a new war is started, breaking out simultaneously in a half-dozen cities from Seattle to Los Angeles, and occasionally, as in the 1922 war of the Bing Kongs and the Hip Sings, extending east to Chicago.

Briefly, tong, the Chinese word for meeting-place, has come to mean club or society, of which there are various kinds; family, protective, and the so-called highbinder, all ostensibly "benevolent" or "protective" associations.

The Six Companies, or Chinese Consolidated Benevolent Society Building, San Francisco.

If you can imagine all persons named Johnson (whether or not they be blood relations) banded into one huge family association to guard the honor of their name, to assist their less fortunate, to protect each other from personal insult or enemy, even from the wrath of the law if need be, you will understand the "family" tongs of the Chinese; a loyalty strange and unknown to our western civilization. Such, for instance, are the Ng, the Wong, the Yee, and the Chan Family Benevolent Associations, and they are essentially peaceful.

To explain the protective tong, you must first understand the highbinder tong. All authorities declare them strictly a product of Chinese-American civilization. No community where there are large numbers of Chinese, save in the United States (not even in China), are they tolerated. Whatever high ideals they may have had, most of these societies have degenerated into little more than blackmailing protectors of gamblers, and drug and slave dealers, and terrorize the community. They are controlled largely by a handful of professional agitators of criminal propensities. Their membership is conservatively estimated to comprise 90 per cent of the Chinese male population of our country.

Most of these members have been literally scared into joining. They deeply deplore the necessity, hate the social evil, and the economic waste resulting from tong practices, as well as the stigma cast on their national good character. For there is no more honorable or peaceably disposed man on earth than a reputable Chinese merchant. But men are forced to join and pay tribute for tong protection against tong depredation.

A dapper Chinese youth entered the San Francisco Chinatown store of a dealer in oriental curios. He inspected a rare old jade ornament and suddenly bolted out of the door with it. The dealer notified the police at once, giving a very accurate description of the thief who was apprehended. Then in court the dealer declared he had never seen the thief before, that it was all a mistake. You see, the thief was a highbinder, and the dealer had not belonged to a tong at the time of the robbery. His loss had been a lesson. Since the arrest he had "joined up"; otherwise, he would have been continually plundered without redress. Had he belonged to a tong in the first place, his tong would have recovered his property or received adequate payment. If a merchant fails to join a tong, he is preyed upon.

If he joins a tong, he must not betray any member or secret of that tong. If he has a grievance against any member of his own or any other tong, he must take that grievance to his own tong to have it remedied. *Should he fail to do so, and seek justice in the American court, he is surely and quickly murdered.*

So he joins a tong and trusts to luck for peace, of which he has little at best.

No organization known will do so much in the exaction of justice for its members — according to its own code—as a Chinese tong. No organization will be so sure and vindictive in exacting punishment. The story of Lee Foo illustrates these characteristics.

Lee Foo, a member of the Bing Kong tong, was arrested, convicted and sentenced to death for the murder of another Chinese in Sacramento. Now when a member is in trouble, his tong never forgets him. Expense is no consideration. Each tong retains an able American criminal attorney. So Lee Foo's death sentence was commuted. He was subsequently pardoned and returned to San Francisco. About the same time his cousin, Lee Lin, also came to San Francisco to collect a debt, a difficult one to collect, apparently, and one day Lee Lin was found murdered. Lee Foo was deeply grieved and gave the American police the name of the man who, he believed, had committed the crime. A brother Bing Kong!

When summoned before the council of the Bing Kongs, Lee Foo was doubtless asked, "Do you mean that you place your family before your tong?" At any rate, two weeks later as he went to attend a tong banquet, he fell and eight bullets were found in his lifeless body. No one was ever convicted of either crime, for what Chinese can be found who will commit suicide by testifying against another Chinese, even an enemy? They are of necessity deaf, dumb and blind if they chance to witness a crime and fall into American police hands.

Court gossip has it that the Bing Kongs had spent more than $27,000 in Lee Foo's defense and liberation. Less than a year later he betrayed a fellow member. His own death followed swiftly. Loyalty to one's tong must come before life itself. Each man must stand back of every action of every other member. Such is tong justice.

Hence it is that there are professional gunmen among the members of each highbinder tong. In the old days they used hatchets. These men kill other men's enemies for the rewards offered. Save during a war involving their own tong, they may serve any tong. Indeed, there is very active competition among them for every reward offered by the family and protective tongs which do not have regular gunmen on their membership rolls. And, although it is claimed that all these professional murderers are "native sons"—(the dreaded deportation cannot be the punishment of a native-born Chinese) they invariably know no English and claim the right of an interpreter if brought into our courts.

Although the United States immigration officials are

The Leaven Is Working

ONE hopeful sign in the present economic reformation is the number of religious publications that have indicated their disapproval of existing human relationships.

It requires heroism to take up this gauge of battle. Reformers in the secular world know this. Misrepresentation and ridicule, oppression and abuse, are the lot of men who do not bow to the self-appointed lords of earth. Mammon is a power in the Christian church. It decrees in too many instances who shall preach and what shall be preached. Care must be taken too frequently not to offend Brother Midas lest he withdraw his support!

In a private letter inquiring as to the details behind a certain statement on an economic issue, a writer on one of the most conservative organs of a leading church made this avowal: "I have been astonished at the reaction in certain quarters from even modest suggestions that the fault is not all on one side, and I am not sure I can retain permanently my place if I continue; but by God's help, I shall, so long as I do continue, give only the truth as I see it, and I will appreciate all the assistance you may be able to give, promising to consider it and to tell you if I feel you are mistaken."

The implied peril is a real one. There is no extreme to which certain elements will not go to force their own views into press and pulpit and to suppress opposition. But the spirit is working, and a brighter day is before the world.

A Great Day When Bankers Begin!

"For the technical improvement of our most important tool, 'money.'"

THIS sentence taken from a letter explains so accurately the purpose of the articles on Finance which appear in THE DEARBORN INDEPENDENT, that it is very regrettable our friends in the actual manipulation of the financial system do not see it. The practical financiers of the country are badly in need of an advisor with vision. The question is one that needs no display of temper but of intellect. At the present time the principal contribution from the professional financial world is temper. It would appear that adaptable publicity men have persuaded bankers to take the high superior way with people who are asking about this or that flaw in our system. The men who should be working with us "for the technical improvement of our most important tool, 'money'" are fostering a feeling that it is unpatriotic and subversive of American institutions to inquire why "our most important tool" remains untouched by the improving spirit of the age. There are communities in this country, documentary evidence of which is on file in this office, where blinded professional financiers have made it a privately punishable thing to read or discuss any phase of the money question.

This is to be regretted because nothing is more likely to throw public interest into the wrong channel, or more likely to foster a destructive rather than a constructive spirit, than this deliberately undertaken effort to suppress the facts or browbeat the public. The reason for this most unwise attitude is that few bankers are financiers. They don't know the Money Question; they could not tell you, to save their lives, the basic principles of wealth and exchange; they are innocent as children of the structure of our monetary system. That is, they are mere merchants dealing in money, as the grocer deals in eggs or the draper in cloth; an appallingly large number of men in banking just know the game of dealing in their commodity at hand. And, of course, when the Money Question arises, they take their views from those supposed to know.

Now, THE DEARBORN INDEPENDENT knows that the real bankers of the United States—some of them are the biggest, some of them are small—are just as well aware as we of the faults and fallacies of the present system, just as well aware also of the chaos which has overtaken the whole matter. And they want to improve our most important tool, money; they want to make it the ready and sufficient servant that it is supposed to be; they want to make banking the handmaid of industry rather than its mistress. These are real bankers. And these men are desirous that all of us together shall study the question so that the people shall have a better understanding of it not only, but so that possible improvements shall be made with the intelligent support of the people instead of merely with their emotional approval. It is a serious reflection on those who have had control of the financial system that they have left the people in such gross ignorance of it until now. It will be, however, a more serious reflection on their intelligence and honor if they permit a misleading propaganda to be loosed, the inevitable end of which must be to show the people that a system which relies upon deception must itself be a deceit.

If THE DEARBORN INDEPENDENT were crying from the depths of financial defeat, as many have done, fighting in a spirit of revenge against a system that had brought ruin, then it might well be regarded as working from a motive which warped the mind. But the work here undertaken proceeds from quite another basis: it is not defeat that protests here, it is success that protests here—the protest being that *the system is not fair* and that it does not insure (industry, intelligence, integrity being equal) a fighting chance to every man. *The protest is that it is a discriminatory system and that it is designedly discriminatory.* And the contention is that the rectifying of it will be a boon to all—financial men among the rest. When will that idea ever come to maturity in the minds of our better-provided-for classes, namely, that no righteous modification can occur which will not be for the benefit of all the people, rich and poor, and the beautifying and strengthening of the best things in our civilization.

This paper will never be found denouncing bankers nor brokers nor money-lenders as such, save where the essential cruelty of some parts of their business has passed over to inoculate themselves; the language of "the class war" is not ours. We are discussing the system only, our interest is scientific and humanistic. And we only regret that the tactics of "the class war" are now in use by those blinded professional financiers who have never yet taken the time to ask and to learn what the stir is all about.

It will be a great day for the United States when bankers begin the study of the Money and Interest questions.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912,

Of THE DEARBORN INDEPENDENT, The Ford International Weekly, published weekly at Dearborn, Michigan, for April 1, 1923, State of Michigan, County of Wayne, ss.

Before me, a Notary Public, in and for the State and County aforesaid, personally appeared Fred L. Black, who, having been duly sworn according to law, deposes and says that he is the Business Manager of THE DEARBORN INDEPENDENT, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in Section 443, Postal Laws and Regulations, to wit:

1. That the names and addresses of the publisher, editor, managing editor and business managers are:

Publisher, The Dearborn Publishing Company, Dearborn, Michigan; Editor, W. J. Cameron, Dearborn, Michigan; Managing Editor, W. J. Cameron, Dearborn, Michigan; Business Manager, Fred L. Black, Dearborn, Michigan.

2. That the owners holding one per cent or more of the stock are:

The Ford Motor Company of Delaware, Henry Ford, Dearborn, Michigan; C. J. Ford, Dearborn, Michigan; E. B. Ford, Detroit, Michigan.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

FRED L. BLACK,
Business Manager.

Sworn to and subscribed before me this 31st day of March, 1923.

[SEAL]

J. EMMET HALL,
(My Commission expires September 29, 1924.)

When Figures Live

UP IN the Northwest where the railroad rates seem to bear hardest—because on farm products the receiver so seldom pays the freight as he does on almost everything else—it is a familiar story that a farmer may often find after shipping and selling his stuff that he is still out of pocket for the freight.

Most of those stories, however, are merely something we read.

There came into the office last week a lumberman from Oregon who showed by his papers that it cost him $409 to ship $425 worth of lumber from Oregon to Utah. That is to say $409 worth of lumber became worth $834 after traveling about 1,000 miles and when sold would have to pay, of course, a profit on the whole $834.

Other papers showed that an $800 car of lumber shipped to Philadelphia ate up $816 in freight, compelling the Philadelphia home builder to pay profit on at least $1,616 for $800 worth of lumber.

A Stanton, Michigan, farmer sold his potatoes for 25 cents a bushel. It occurred to him to do a little practical work in political economy, so he wrote a little note and deftly inserted it with a plug into a potato. The note read: "I get 25 cents a bushel for these potatoes. How much did you give?" A woman in Pennsylvania found the note while peeling potatoes for dinner. She had paid 30 cents a peck. That is, 25 cents worth of potatoes became worth $1.20 while going a day's journey by railroad.

These are facts which may take on many different colors under the treatment of the experts. But no amount of expertness can expunge the facts of the farmer underpaid and the workingman's family overcharged. When it is worth 95 cents to convey 25 cents worth of potatoes from a farmer to a workingman, you have only to picture a sufficient increase in the middleman to see what it will all come to. Extend farming and industry universally and you have wealth. Extend this kind of middleman universally and you have nothing.

A Saint in a Sack Coat

THE *Michigan Churchman* in a notable number commemorating the sainted Bishop Charles David Williams, of the Episcopal diocese of Michigan, quotes a few of his sayings which deserve the widest currency. Before reprinting them we should explain the use of the term "sainted" in the previous sentence. Bishop Williams would have lacked words to express his repulsion of such a word as applied to himself. But our conception of saintliness changes, takes on different aspects, as do our conceptions of other forms of service. This man was a saint. But no man knows himself to be a saint, and only the collective judgment of a competent group can proclaim it. In Protestantism there is only public opinion to acclaim great spiritual leaders; in Catholicism there is a court of inquiry and record. The advantage of the Catholic system is that it rescues from obscurity many lives that were not sensational enough to attract public attention.

Charles David Williams was a saint, but not a cloistered one. He was not only concerned with the welfare of the soul of the individual, though far back in his religious philosophy lay the truth that the ultimate is the individual, though the objective may be the race. He was a priest of the individual's life but he was also a prophet of the human. If the individual cannot be restored to unselfish ideals and actions, there is no hope whatever of humanity. Bishop Williams' personal religion was that individuals could come into personal contact with a restorative, reconstructive power which some name "the universe" and others named God—he named it God—but he insisted that when this individual experience was realized, it would exemplify itself in service to the man who could not understand religion or anything else but only the fact that his utmost effort and sincerity still left the earth a most distressful planet.

The selection from Bishop Williams' sayings, just now alluded to, follows:

"Take all you can out of yourself, but never *for* yourself."

"Have, not merely to hold, but to share."

"Do, that you may help."

"Be, that you may bless by your being."

Bishop Williams was a saint in a sack coat, and he would have been more popular in the Cathedral had he been less loyal to the Master whom his soul dearly loved.

Mr. Ford's Page

CHARITY in its real essence will always exist; it means human sympathy and helpfulness. But charity as we have been taught to conceive it, the salving of wrong conditions by wholly insufficient and temporary alms, will not exist much longer among intelligent people. When the challenge to charity was issued in these columns two or three years ago, some were doubtful how to receive it; but now those ideas have become quite commonplace. It is little less than amazing to observe the change which has come upon the community with regard to this subject.

The first reaction, of course, was that the opposition to "charity" was due to a form of stinginess. A man possessed of money, and daily importuned for gifts, invented a philosophy behind which to defend himself—that, naturally, was the first explanation. It so happens that a man thus importuned has an opportunity to observe the whole workings of the charitable system in such a way as to be able to understand what would happen if every deserving person and cause were served in the way it demands to be served. For one thing, presently there would be no one left to ask for gifts and the root cause of the need of charity would not be removed. The number of "charitable objects" living by this form of beggary would bankrupt the givers. This is a fact which will probably be meaningless to many, but there are minds which should be able to see its significance. The ultimate resolution is this: our system is so faulty that it would consume in alms what it makes in illegitimate profits. There is no genuine gain in a wrong system.

> *WHY is it that heads of business and moneyed men are considered the logical dispensers of charity? Is it because they are judged as having taken more out of the community than strict justice would permit, and "charity" becomes a means of salving the public and their own conscience? Is it wholesome when churches and colleges and other public institutions depend on the doles of the rich and not upon the general abundance of the people? Is there anything more degrading to a business concern than to underpay its men and then supply even churches and pay ministers and give them to the men as gifts?—and is there anything more degrading to the men themselves? Charity in this sense is a most despicable thing, staining him who gives and him who takes.*

And because this criticism of our wrong system began to appear, there came into existence a painless form of charity. Charity was organized, standardized, made easy. Clever people, with an eye to their own advantage, began to say, "Here, ladies and gentlemen, you are harried and harassed all through the year by this form of need and that; you are lacerated in your sympathies by being called upon to consider this kind of distress and the other. You write check after check and you consume much time looking into matters pertaining to other people's troubles. Now here is a brand new scheme—you write one check a year and leave it to us to distribute it; we are standardizing and card-indexing charity."

Not only was it proposed but it was adopted. It was a perfect system of dehumanizing charity, and despicable as charity always is—degrading to the man who is compelled to receive and the man who is compelled to give—this standardized form made it much more despicable. People are coming round to this fact at last. The collapse of the whole institutionalized propaganda is one of the hopeful signs of these times.

Of the alms of sympathy and helpfulness there will never be an end; even were the need of material aid to pass away, the need of friendliness will not. Spiritual almsgiving will remain. But if we look at the genesis and development of what we know as "charity" we can see that it began in injustice. Charity was first practiced by those who were conscious that they had withheld another's due, and to soothe the sense of wrong they added a dole. Material charity has an evil history. With fair dealing the largest part of the need for material aid would pass. The only real charity, the only true kindness, is to leave a man free to reach a position where he need not bow to any man in those things wherein he has an inherent human right. The airs which a man takes to himself in helping a needy fellowman who should never have been in need—those airs, that secret feeling of superiority, is just as damaging to him as the other's humiliation is to him. The whole system grows out of wrong conditions.

And then there is the thought which has practically become a philosophy, a creed, a principle, that a man who has been successful in business is in duty bound to support churches, colleges and various other public works. It sometimes seems that churches have left their main concern with religion and life, and colleges have left their main concern with education, and hospitals have left their main concern with health, to become moneymongers. The heads of the church are no longer theologians, the heads of the colleges are no longer scholars, the heads of the hospital organizations are not always men deeply steeped in the lore of healing—they are mostly collectors. They are chosen because of their qualities for collecting money. And the business man is considered their legitimate prey.

That condition grows out of this: Business used to be a method of amassing a private fortune. The man took the money out of the community, and these collectors worked upon the theory that it was only right that he should put some of his gains back—by gift to certain institutions. They even offered an added bait of personal honor in doing what they told him he was morally bound to do. And as long as it was true that the business man was a sort of buccaneer, constantly taking, taking, taking from the community, it was only right that a gentle and complimentary pressure should be exerted to have him put something back.

Suppose, however (and it is not supposition, it is actual reality) a man regards his business as his service to humanity just as much as a college or a hospital is. That changes the situation, doesn't it? You would not demand of one college that it make a gift to another. You would not think it wise to expect one hospital to contribute money to another. It is a mighty significant fact that all of these institutions have managed to suppress the idea of independence and self-sustenance and also the idea of putting themselves in a position to do for others the very thing they are constantly demanding should be done for themselves.

If business is taking more than it should from the community, then it is true that it may buy some of the respect to which it is not entitled by giving money sops. But if business is engaged in doing the best for the community, then it is entitled to say to the community, If you want these institutions, pay for them! Is anything quite so degrading and insulting as a concern which underpays its men, and then builds a church for them and pays their preacher? Is that charity? Is it humanity? Would it not be far more just, more human, more Christian to pay the men and let them build their own church? And then go on paying them so that they could build their own colleges for their sons?

The whole idea that these institutions must be supported by rich men grows out of a condition in which business has failed to put itself on the plane of a public service institution. Why should not a great business concern be itself so serviceable that it would win instant recognition of itself being one of the public institutions, comparable to the college or the hospital? If a business is so organized that it secures to a large section of the people their livelihood and gives serviceable outlet to their energies, is it not doing for those people the basic service on which other institutions are built? Should it be only the head of the business that gives to colleges and hospitals? Should not the workmen have such a just share in the profits of the business that they too can support colleges? It is a far more human and honest situation for workingmen to be building their own schools and bearing their part in the general development than it is for a few rich men to parade as benevolent overseers of the community welfare. That was the way colleges began—in the endeavors of the people. That was the way hospitals began. And certainly colleges were less the instruments of suppression and propaganda when they were the creations of the people, than they are now as creatures, in part at least, of the moneyed group.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

The Almanac—as Ancient as Civilization Itself

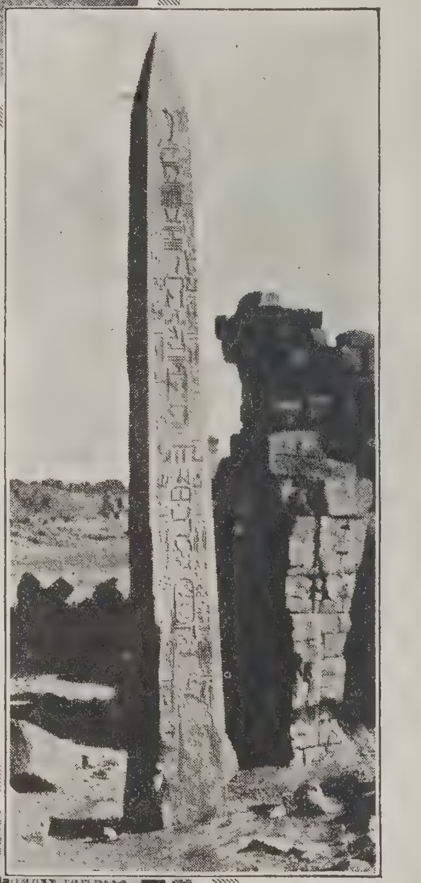
Ancient Egyptians the First Practical Makers; Millions of Copies Now Printed Every Year

By F. N. HOLLINGSWORTH

The famous Aztec calendar stone now in the National Museum at Mexico City. It is said to give the key to the hieroglyphics by which the priests interpreted the secrets for predicting the seasons and various astronomical phenomena.

ONCE again the almanac is a center of interest. The little pamphlet which hangs in the kitchen, with its funny little "signs of the zodiac" and its "phases of the moon," its list of notables born or deceased on certain dates, its recipes and anecdotes, is one of our commonest possessions, yet its history is older than the pyramids. They are practically indispensable nowadays. The possessor is able to ascertain what the weather will be next July when planning for the summer vacation; what time it will be high or low tide when going to sea; what time of day in any given month to light his automobile lamps at sunset, and much other miscellaneous information, according to the almanac he possesses.

If he be a farmer, the almanac will tell him when and how to plant potatoes, peas and corn; how much top dressing required to an acre and how much nitrogen given types of fertilizer will yield to the ton; it will tell him how to care for poultry and his wife how to care for teething babies; provide his children with charades and riddles for a winter's entertainment; tell him what the postal regulations and rates are; give him a list of Congressmen from his state and the salaries of high government officials; the days of court sittings and all the legal holidays and anniversaries; in fact, provide him with a host of informative facts in compact form.



The Great Pyramid (Cheops), the Second Pyramid (Chephren) with the Sphinx and the unearthed Temple of the Sphinx. At right—An Egyptian obelisk. It is claimed that many of these obelisks were erected under the direction of the Egyptian priests to enable them to calculate astronomical problems, such as the length of the solar year, etc., and that many trials at different heights were required to get the exact data. Also that the astronomical secrets of the priests were inscribed on these obelisks.

There have been almanacs of sorts ever since man began to be civilized; the earliest ones were controlled by the priests, medicine men or astrologers and wise men of the ancient races. They alone knew the mystic secrets of the stars and planets, and kept these secrets themselves, making predictions as occasion demanded, or the financial consideration was forthcoming.

As the Chaldeans are said to have been the first astronomers, so the Egyptians are said to have been the first almanac makers. Or so, at least, is claimed by Moses B. Cotsworth, an Englishman, who has made many observations and investigations of monuments in Egypt, Arabia and Great Britain, which led him to conclude that the massive, towering monuments in these countries as well as Mexico, France and elsewhere, erected by ancient races, whether vertical stones, sun stones, monoliths or obelisks and pyramids, were used to solve the seasons and that the inscriptions sculptured upon them are in reality giant almanacs, of the only form that the ancients knew, and decipherable even at that time only by priests and trained astronomers.

He does not trace any direct connection between the Egyptian monuments and those in Mexico or other countries, but believes that the results were arrived at in each case in much the same manner, and for the same reasons—that the priests needed some means of locally predicting the weather and seasons, since the population was largely agrarian and their very lives depended upon full crops every year, to say nothing of the wealth that came to them from other countries which had to buy grain from them in return for other goods.

Mr. Cotsworth's observations convinced him, after a long series of investigations, that the Egyptian monuments were successively built for the purpose of finding out the length of the year, after the priests had by experience realized that their object could best be obtained by studying the sun's meridian shadows cast from the highest pointed structures they could best erect as pyramids. They apparently had difficulty in settling the true length of the year, which could only be differentiated by comparing the equinoxial noon shadows, cast from the great heights to which their pyramids were raised. The last pyramid, the Great Pyramid, the most perfect, is so constructed that it "consumes its own shadow" at midday of the Vernal Equinox, or March 25, when the oldest complete style of year began. Thus, according to Mr. Cotsworth, the length of the solar year was obtained. Through many generations, the Egyptian priests kept secret the development of zodiacs and almanacs, but finally they were sculptured on the tombs of the kings, and handed down for future generations of soothsayers.

Other nations took up the almanac, their priests and a few other learned men getting their information from the Egyptian priests and keeping it rigidly a secret among themselves.

But this was too much of a monopoly, and there was too good a thing in it for it to be passed up by others ambitious to break into the prognostication and prediction game and competition sprang up.

A section of the wall of the Temple of Hathor, Denderah, Egypt. It was on the obelisks, walls of the temples and the tombs of kings that the ancient Egyptian almanac calculators inscribed the secrets by means of which they would forecast weather, the seasons, etc.

However, it was not until after the invention of printing and movable type that the almanac business really flourished. Since then there have been thousands of almanac compilers, publishers and printers and billions of copies have been produced. Today it is hard to say just what is the total output annually. There are almanacs for the housewife, the farmer, the photographer, the astronomer; nautical almanacs for the navigator; statistical almanacs almost as thick as a volume of the Encyclopedia Britannica, packed with data and information of all kinds; sports almanacs; and comic almanacs galore.

The work of compilation is now done by experts who work out astronomical data of all kinds, calculating and re-calculating and checking up their work, obtaining the data from the great observatories of the world, the coast and geodetic survey bureaus, the weather bureaus and many other sources.

Those who use a chronology for the previous year have these pages made up from index files of memoranda that are compiled throughout the year and kept constantly up-to-date. There are professional almanac compilers and those who specialize in certain branches of the work. Almanac publishers keep large clerical staffs busy throughout the year, besides large printing establishments that are also busy with the composition, proofreading, electrotyping and in some cases engraving work required; finally working at top speed during the last half of the year with the presswork and binding of the enormous editions frequently put out.

Some carry advertising outside that of their own establishment and keep a staff of advertising solicitors out through the year securing advertisements for their almanacs. There is an enormous amount of correspondence and editorial work even to a comparatively small one, if it is intended to be accurate in all its information.

The Fasti of the Romans was much similar to the modern almanac. The origin of the word itself is shrouded in obscurity, but it was first used by Roger Bacon in 1267 for a table of notations of the motions of the heavenly bodies. Previous to his time the register was known as a "Computus," "Martyrologium," "Calendares" and "Fasti." It is believed that the word came from the Arabic, "al manakh." In the Arabian-Castilian vocabulary, a manakh is defined as a calendar and a manah as a sundial.

Early registers or almanacs were not annuals, but what are called today perpetual almanacs, one so arranged that it can be adjusted for any given year. Navigators were the first to use annual almanacs—those navigators who in early times did not venture far out into the open sea, but kept well in sight of the coast, with some island for a landmark. At night they utilized the positions of the stars, their rising and setting, tables of which could be found in the "ephemeris," or astronomical almanac, a book of tables giving the computed positions of various known heavenly bodies for each day in the year.

One of the earliest of these registers is the Papyrus Sallier, the original of which is in the British Museum. It was compiled by a contemporary of Rameses II, who is supposed to have reigned in the thirteenth century B. C. In it every day in the year is credited with its good and evil virtues, registering thus the lucky and unlucky days, as a guide to the mariner and traveler.

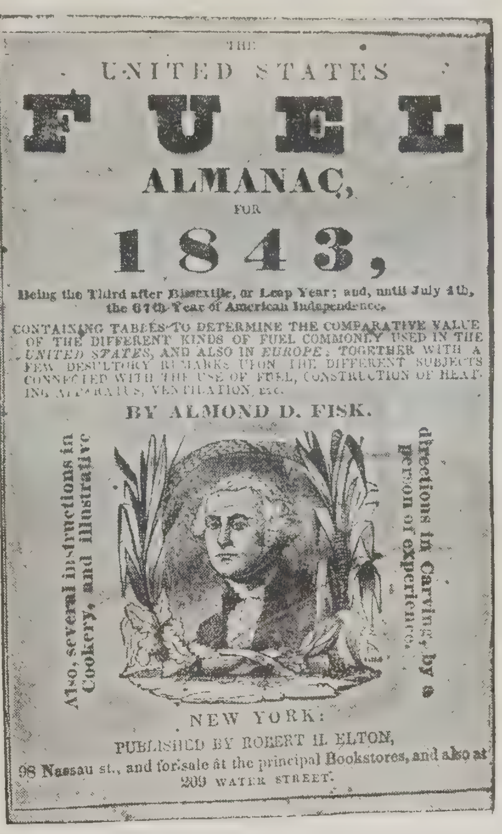
An almanac compiled by Pürbach (1450-1461) is the earliest printed almanac known, and the earliest English almanac-calendar in the British Museum was printed in 1431. Regiomontanus printed the first important one at Nuremberg in 1472. This was quarto size, containing 12 leaves and sold for ten crowns in gold. Compare that price with the many millions *given* away in modern years since!

Some fine specimens of the Roman Fasti on marble have been unearthed at various places, among the most remarkable being the Fasti of Verrius Flaccus, preceptor to the grandson of Augustus, which was unearthed in fragments.

In the museum at Naples can be seen an ancient Roman Farmer's Calendar or Rural Almanac, known as the Calendarium Rusticum Farnesianium. It is a marble cube, about 2½ feet high, inscribed on each of the four faces, three columns to a face, each column representing a month, with the appropriate sign of the zodiac at the top of the column. In each column is given for the month the number of days, position of the nones, length of day and night, name of the sign through which the sun passes, the god under whose protection the month is placed, various farming duties to be performed and a list of the festivals for the month. The modern Old Farmer's Almanacs are strikingly like this ancient Roman almanac.

A similar stone almanac is the famous Mexican Calendar Stone, a 12-foot square of basalt, three feet thick, on which are engraved in figures nine inches high hieroglyphic figures giving the ancient Aztec divisions of time. Around the central disk of this great stone are smaller disks carved in seven-inch relief, representing the day, the week, the month, the year and the cycle. This calendar stone is now built into the walls of the Great Cathedral and is of much interest to strangers.

From the time of Regiomontanus, ambitious printers in various countries got out almanacs of all kinds. During the reign of Queen Elizabeth the right to print and publish almanacs and "prognostications," as they were generally called then, was granted to two members of the Company of Stationers, London, and extended by James I to include the two universities (Oxford and Cambridge) in the monopoly. This monopoly was challenged by Thomas Carman, a printer-bookseller who published an almanac for three years in succession, although three times imprisoned when prosecuted by the Stationers' Company for infringement of their monopoly. The case was finally decided in Carman's favor, in 1755 and the monopoly was broken.



THE
UNITED STATES
FUEL
ALMANAC,
FOR
1843,
Being the Third after Bissextile, or Leap Year; and, until July 4th, the 67th Year of American Independence.

CONTAINING TABLES TO DETERMINE THE COMPARATIVE VALUE OF THE DIFFERENT KINDS OF FUEL COMMONLY USED IN THE *UNITED STATES*, AND ALSO IN *EUROPE*; TOGETHER WITH A FEW DESULTORY REMARKS UPON THE DIFFERENT SUBJECTS CONNECTED WITH THE USE OF FUEL, CONSTRUCTION OF HEATING APPARATUS, VENTILATION, etc.

BY ALMOND D. FISK.

Also, several instructions in Cookery, and illustrative directions in Carving, by a person of experience.

NEW YORK:
PUBLISHED BY ROBERT H. ELTON,
98 Nassau st., and for sale at the principal Bookstores, and also at
209 WATER STREET.

Title page of the United States Fuel Almanac for 1843. This contained a standard scale of prices for coal and wood, together with directions for using anthracite.

Bradford's Press published some of the earliest almanacs in the United States, at Philadelphia, in 1687. Benjamin Franklin began the publication of his famous "Poor Richard's Almanac" in 1792, under the pseudonym of Richard Saunders, but his brother, James Franklin, preceded him with a Rhode Island almanac in 1723. This was known as "Poor Robin's Almanack" and when he died his widow continued the publication until 1741. Poor Robin said: "There is not a more dishonest Business in the World Than An Almanack Maker." An original copy of the 1733 Poor Robin Rhode Island Almanack, in splendid condition, is in the collection of the American Antiquarian Society at Worcester, Massachusetts. There are 10,000 almanacs included in this great collection of Americana. Samuel Green printed an almanac at Cambridge in 1656, compiled by T. S. Philomathemat (a pseudonym) and the Rev. Cotton Mather compiled one in 1683, which contained, besides the calendars, one of his famous sermons, specially written for the purpose.

Mrs. Franklin ran the printing business as well as the almanac publishing business very capably after her husband died. She was one of the few early American women printers.

In the collection of the Rhode Island Historical Society is a notable group of almanacs, which includes specimens of James Franklin's Poor Robin and Ann Franklin's later editions. James Franklin's son published under the pseudonym of Job Shepherd. Ten years later, in 1760, he got out one compiled by Nathaniel Whitefield. Three years afterward William Goddard got out the first of Benjamin West's Rhode Island Almanacs. West was succeeded by the fictitious and famous name that he adopted of "Bickerstaff." Then in 1769 West's place was taken by "Ambraham Weatherwise." "The New England Almanac or Lady's and Gentleman's Diary," first by West and later by Bickerstaff, had a life of 118 years, varying from time to time in title, author and publisher, but continuing regularly. Among the other names used by the compilers were: "Copernicus Patridge and Daniel Freebetter."

Paul Revere, among his many other activities, made illustrations and engravings for Ambraham Weatherwise's Almanack in 1781, including a portrait of George Washington, which was inserted.

An American home would not be quite complete without one or two almanacs hanging up somewhere about the house, usually in the kitchen, where the housewife may consult them at any time. For years certain well-known patent medicine concerns printed and distributed free millions of such almanacs, and they have become a household institution. One of them began publication back in 1852 and continues to the present day, while the Old Farmer's Almanac of New England is now in its 131st year, and is the oldest almanac, that has been continuously published, in existence under the same title.

Tong Wars on Increase Along West Coast

Concluded from page 3

insulted by the question, the San Francisco police department frankly believes that many Chinese have been smuggled into the country at considerable expense (the cost averages about $2,500 a man) and that until the debt is paid, they are virtually slaves to the tong which gained their entrance. At any rate a man who chances to be under obligations to a tong does not refuse to kill when ordered to do so.

We are constantly reminded by the defenders of tong practices, mostly their American attorneys: "You must distinguish between highbinder and protective tongs; the latter being the direct result of the former, risen from various sources, family, merchant or labor associations, as protectors against highbinder depredations."

They may have higher ideals, but they offer just as large rewards for the heads of their enemies, and they fight with the same vigor and craftiness. The difference is vague, for their principles of honor and their modes of living seem quite identical. What is today a peaceful protective tong may tomorrow be acting like an enraged highbinder association.

The number of tongs is estimated at four by the Chinese consul general in San Francisco; at 14 by Sergeant John J. Mannion, of San Francisco's Chinatown police squad. Which are which is more than anyone seems to know. The most notorious are:

> *The Hop Sing Tong*—"United Victory"—the oldest, and which has been more or less constantly at war for years.
>
> *The Sen Suey Ying Tong*—"Order of Auspicious Bravery"—reputed to be the smallest and worst of all.
>
> *The On Yicks*—"Beneficence and Peace"—the first tong that ever fought a family, a fight which broke it financially. It hasn't fought for 12 years.
>
> *The Hip Sing Tong*—"Harmonious Victory"—the best known, having the most chapters in eastern cities, with official headquarters in New York City. It is among the youngest of the tongs, and until last year was fairly peaceful. Since then it has quarreled with and fought both the Hop Sings and the Bing Kongs.
>
> *The Bing Kongs*—"Justice Lovers"—the largest and richest. Self-styled the "Chinese Free Masons" although it is in no way connected with the Masonic Order.
>
> *The Suey Sing Tong*—"Auspicious Victory"—recently lost its chief, and subsequently met with severe action at the hands of Sergeant Mannion, more of which later.

A dozen more are duly listed and chartered, but they are of lesser importance.

Tong prosperity? Well, after many long and losing wars the Hop Sings are poor; while the Bing Kongs, younger and fresher, have won and prospered.

They are each incorporated for 50 years, and once started seem to owe no responsibility to public peace and welfare. In fact, the charters of persistently troublesome tongs have even been renewed in recent years. Hence the Hop Sings' charter now dates from 1917, the Bing Kongs' from 1911, the Suey Sings' from 1913, and so on.

A tong man must punctiliously pay his tong dues. The amount is small, although accurate data are quite impossible to get. It seems to depend on the individual's earning power, averaging around $10 a year. Frequently those who have shirked this responsibility have been surreptitiously shipped away on fishing vessels and their wages collected by their tong until their debts were cancelled.

Then, too, many are the men who having purchased a ticket to China, having packed their bags and gone to embark on the homeward-bound ship, find themselves arrested at the wharf, or even on board ship at the hour of sailing, charged with embezzlement and brought back to the American court. Almost invariably these are trumped-up tong charges to collect tong dues.

Although the tongs are known to pay and receive large fees and indemnities, neither Bradstreet nor Dunn nor any of the Chinese banks nor the Chinese departments of American banks can furnish any information concerning tong finance. The cashier of a large national bank in San Francisco said that it, like all other banks, had to put implicit trust regarding all Chinese matters in the hands of its Chinese department manager. In ways unknown to banking he ascertained borrowers' credit, and was deeply hurt if questioned. "You trust me? Very well."

"It seems a haphazard way and I, a banker, disapprove," he said, "but we find his judgment always right. We never lose a penny in his department."

As for getting information about tong finance from the kindly old Chinese himself—he just smiled and answered, "I am not a tong man. I do not know tong men. I build this department well and seek only the accounts of the good Chinese."

The headquarters of most tongs are in San Francisco and according to Chinese standards are luxurious. The club quarters are always on the top floors of their buildings, which are usually five or six stories high, and consist of one large hall with an altar or joss at the rear, and a lantern-hung balcony overlooking the street at the front. In the Bing Kong's, for example, the furnishings are a queer combination of oriental and western ideas. The joss is very fine. Its front is an elaborately carved teak table. On it stands a brass plaque engraved with a Chinese proverb. There is a bronze vase, and soapstone figures of a god are on its right and left; at each end are massive vases adorned with red good-luck slips. Behind this table is another and higher one holding five great pewter temple ornaments. Behind that again, in a recess, is the shrine proper, where these pious worshipers plant the lighted joss sticks and read their fortunes with the sheaves of bamboo fortune sticks. The long council table and stools are teak. A few pictures by Chinese artists, a tremendous mirror covering one whole wall, their neatly framed charter and attorney's picture, complete the furnishings, except for the cheap grandfather's clock and hideous gas fixtures with flickering lights.

There are always a small kitchen and a dining room on the same floor with many little tables and innumerable bowls for tea and rice. Here the member prepares his simple meal. Ordinarily in the hallway are the membership records, long narrow strips of bright red paper hung one over the other and covering the entire wall. The lower floors are sleeping quarters for members, and occasionally for members' families, while the street floor is often occupied by small shops of individual members.

Under no circumstance does the highbinder carry evidences of his occupation to the tong rooms, which are maintained in orderly decorum. There you will find no stolen goods, no gambling, no noise or wrangling, no accumulation of baggage, no promiscuous burning of sacrificial papers. But there, when a tong is in session, matters are arranged that are *entirely foreign to American ideals of liberty and justice. Fines and penalties are decreed, crimes planned, wars declared, and enemies sentenced to death. Such are the "peace" headquarters.*

When war is declared changes are rapid. The deserted club is left to the protection of heavy bolts and chains and an American guard, while every member of the belligerent tong either goes into hiding or departs for war headquarters with his roll of blankets. Sergeant Mannion, determined to end the fighting in San Francisco, has promised arrest for every tong man caught in the city while his tong is fighting.

The day I visited the tongs, the Suey Sings, having signed another peace treaty, were returning from war quarters. Their reception room was literally filled with piles of blankets reaching from floor to ceiling. At the Hip Sings the rooms were empty, save for two very old men and the guard. Inside, the windows were entirely covered by carefully placed round table-tops, and a similar barricade surrounded the beds of the old caretakers. No prowler could skillfully shoot them from the next roof. The first floor entrance door and the doors on each floor were securely bolted and barred with heavy chains that clanked noisily when the hired American guard admitted us. In Chinatown the police, who always wear plain clothes, have easy admittance everywhere.

At the Bing Kongs we also found things securely bolted and thoroughly guarded when, breathless, we finally reached the top floor. The Chinese evidently do not believe in elevators. We were courteously welcomed by the several men there, and they graciously helped us to take some pictures. A real favor, for the Chinese are still a bit superstitious about pictures. But when the police sergeant opened the door leading to the balcony over the street, and went out to water their neglected, dying plants, they withdrew to the farthest corner of the room. "I locked up Lew Ah this morning," he casually remarked, "told you fellows to stay out of sight."

Out of the Valley of the Shadow

Touch and Hearing Built Up to Aid Veterans Blinded in War

By J. H. WALTON

"Being blind is a difficult enterprise, no matter how bravely we may view it. It is a violent shock to be snatched from the solid earth, down the dark waters of the years and set adrift in the darkness."—Helen Keller.

ON A 99-acre estate in the outskirts of Baltimore, Maryland, the American Red Cross has undertaken the tremendous task of re-educating our blinded soldiers. There are about 90 veterans "with minds alert and hearts courageous" now being given instruction in various trades and professions, and many others have been "rehabilitated" and are today self-dependent men and self-reliant citizens in their communities.

When we lose one or more of our senses we are not given a mystical sixth or seventh sense. But, we can train and cultivate the remaining senses so that they become more efficient and dependable. Touch and hearing have wonderful powers of which most seeing persons remain always in ignorance.

It is the senses of touch and hearing that are given special training at the Evergreen School for the Blind. Very appropriately is it named Evergreen. It symbolizes so fittingly the evergreen hope and courage with which these men are facing the storms of destiny.

These blind students have even to be retaught to live, and shown that, by using their other senses to a greater extent than formerly, they can, in a way, make up for their blindness. They have to be taught to fight against melancholia, which, if it gets the upper hand, increases their helplessness. They must be protected from morbid ideas, and encouraged to take an interest in life, and shown how to fight against despair and hopelessness. They must be taught confidence, and to believe that by working they are still useful members of the community.

Their practical instruction consists in Braille writing and reading, learning to do without assistance at mealtimes, and walking about the buildings and grounds. Without this instruction the blind man cannot be trained in the correct principles, as unless he is taught to rely on himself he will never dare to attempt anything unless a helping hand is offered him.

The reading is done with the fingers and in most cases develops the sense of touch to the highest degree. Many persons suppose that a newly blinded man immediately acquires an exceptionally delicate sense of touch, but such is not the case. Some men possess so poor a sense of touch that they have great difficulty in improving upon it. It requires a great deal of patience to master the difficult art of tactile reading. Braille is a system of raised dots, three being used as a unit, the many combinations of their relative positions representing the various letters of the alphabet. It is somewhat on the order of the Morse telegraph code, with some variations.

It is the purpose of the school to train every man so that he can use the typewriter, be able to write intelligent business letters, and have a sufficient amount of Braille to enable him to keep up his own notes and to read satisfactorily. Evergreen has the largest library of revised Braille in the country, and the blind student, after he has learned to read, has access to some of the best literature as well as current magazines which have been done in Braille.

During the earlier days of the development of the Evergreen School it was felt that one of its greatest needs was a relief map of the grounds and buildings, one by which those students newly entered could learn how to go from place to place.

The idea of the need of such a map first came to one of the soldier students who had been blinded on the battle fields of France. Because of the fact that he had been a cut stone draftsman for 10 years before going into the service, he was able through his persistent efforts and unusual ingenuity to develop this idea.

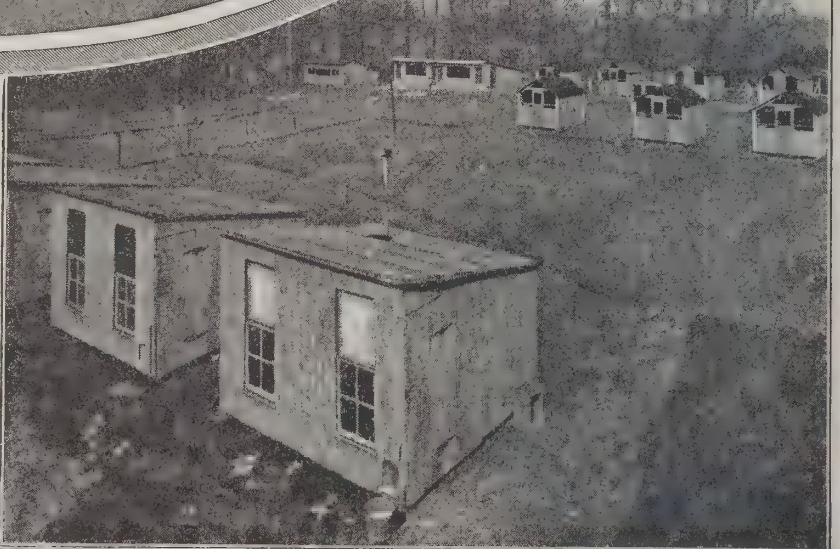
The work was undertaken purely from a spirit of making something which would be helpful to his comrades.

There are approximately 100 acres in the tract in the form of a long narrow rectangle. By choosing a scale of one inch equal to 50 feet, a map of convenient size was made. Only a small blue print of the grounds was available, and this did not show the location of all the buildings. It was, therefore, necessary that a great many of the dimensions and locations be obtained by actual measurement with steel tape.

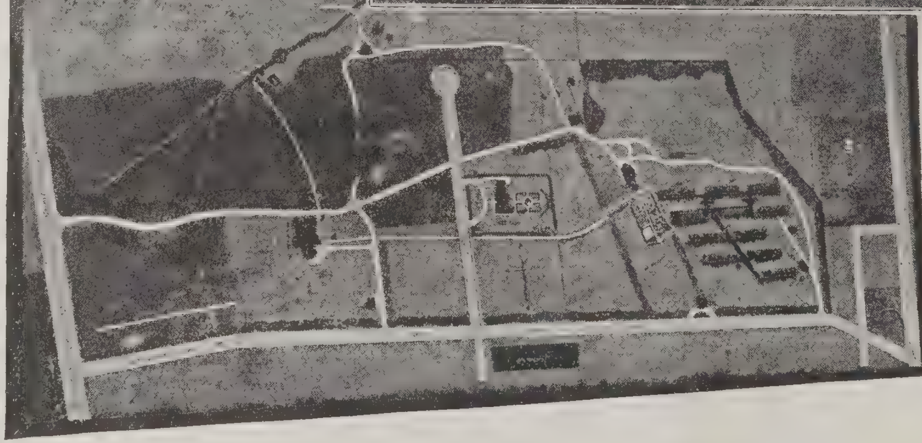
The next problem was to decide what materials should be used to represent the various buildings and landmarks, so that an idea of direction, distance and relative location could be obtained through the sense of touch. The materials chosen were those found in the different shops of the school. No attempt was made to represent the contours of the ground in relief. The basis of the map is, therefore, a flat surface.

The main streets which pass the property are designated by a coarse grade of sandpaper cut in strips the width of the street A finer grade of sandpaper is used to designate the cinder driveways within the grounds. All concrete sidewalks and board walks are shown by strips of cane used in caning chairs. Every tree which stands out alone as a landmark is located by a round-headed tack. Wire is used for fences and railings; small wire nails for fence posts and telephone poles; narrow strips of leather for a brook winding its way through the grounds; imitation leather for hedges and underbrush; and a linen-grained cloth for solid woodlands. The leather and cloth are used in the bookbindery.

More than half the men in this orchestra are totally blind and none is able to see well enough to read.



Each student in the poultry-raising class has a pen and a yard assigned to him and he performs all the duties connected with it just as though he were sighted.



Braille map of the Evergreen School for the Blind. This was made by one of the blind soldiers.

One of the most interesting developments of the map are the buildings. Small blocks of wood about one-quarter of an inch thick were cut to conform to the shape of the ground-plan of the buildings. The porches along the buildings are represented by a groove which is thinner than the building proper. The steps to the porches are shown and every door leading into a building is located by a small nick cut in the side of the block.

All the buildings, streets and other landmarks are designated not only by having their names printed beside them, but also by placing the names in Braille. The Braille is made by using small round-headed tacks. Arrows made of wire, located on the streets leading away from the property, point to the street car lines which lead to the city. These lines are also named in Braille.

In the upper left-hand corner is this legend:

BRAILLE MAP
of Grounds and Surroundings
U. S. A. General Hospital No. 7
and
Red Cross Institute for the Blind,
Cold Spring Road, Guilford, Baltimore, Maryland
Designed and Drawn by
Private John E. Benson, Co. C, 29th Engrs.
Scale 1 in.=50 ft. April, 1919.

This same legend is written in Braille in the upper right-hand corner. Below the Braille legend is a key to the various landmarks on the map explaining the material used to designate them.

Familiarizing himself with this map, reading and writing Braille, typewriting, English and hand training are the principal features of the supplementary or preparatory course. After these things have been mastered the student comes to the question of industrial training, the thing that is to fit him to re-enter commercial life with a good chance of successfully competing with his more fortunate brothers.

The thought behind all efforts put forth at Evergreen is to send from it, as quickly as possible, well-rounded men, men who are in every way equipped to meet the social, civic and economic requirements of their respective communities. It is for this reason that the men are encouraged to take some work in each of the four major courses of instruction, namely: Supplemental or preparatory, vocational, avocational and recreational.

Vocational training is now being given in three general lines—agricultural, commercial and industrial. There are many subdivisions of each general course. For example, in agriculture, such subjects as farm management and poultry raising may be taken. Likewise in the commercial course, one may specialize in general salesmanship, insurance or store management. The widest possible latitude is given, so that a man may obtain almost any kind of training desired, so long as it appears to be practical and advisable.

Because the blinded soldier has an assured income from the government, officials in charge of the re-education of these boys have been working toward the establishment of some of them in what have been termed "unit industries": For example, a vulcanizing shop, a store, a cigar factory, or on a poultry farm. In each instance the man can, if necessary, begin the undertaking with not more than one assistant, and this helper may be a relative.

The success or failure of these unit industries depends in a very large measure on the ability of the man to fill the part of manager. In most cases he also has to be a purchasing agent as well as a salesman.

Each of these industries has a series of processes to be performed, and the man who can conduct all of them successfully is the man who stands the best chance of managing his own enterprise. During his period of training if he discovers that he cannot do a certain part of the work, he realizes that he will have to hire some one to do that part for him if he is to conduct the whole business. More than this, he may decide that he would rather perform any particular process which he does well in some other man's organization

(Concluded on page 11)

He Has Two Reputations in Literature

Ray Stannard Baker's Dual Personality as an Author

By FRED L. HOLMES

TO HAVE built up two widely recognized names in the literature of the country has been the experience of Ray Stannard Baker, reporter, author and novelist. Mr. Baker has a dual personality as a writer.

Under his own name he has scored many successes through his authorship of articles and books on historical, scientific and economic subjects.

Under the pseudonym of David Grayson, he has written five books, delightful pastoral essays and stories which have won recognition even where the name of Ray Stannard Baker is unknown.

"I sometimes feel a little jealous of the popularity of David Grayson," said Mr. Baker recently, when he was asked regarding this dual literary personality, "but under the circumstances, I can bear it."

Mr. Baker made a trip into the Middle West during the autumn of 1922. A secondhand book dealer, in one of the university cities which he visited, was telling one of his customers that when a person asked his recommendation of a book to be presented for Christmas, he always suggested one of David Grayson's volumes.

"He is going to speak here tonight," remarked the customer.

"Who?" asked the book dealer.

"Why, Ray Stannard Baker," came the customer's reply.

"What's that got to do with David Grayson?"

"Everything! Don't you know that Mr. Baker and Mr. Grayson are the same person?"

Why He Became Grayson

THE book dealer paused for a moment. He seemed stunned over the information.

"I don't believe a word of it," he finally remarked.

The result was a consultation of the evening paper and then a copy of "Who's Who in America." Sure enough, the customer was correct.

"How did you come to use a pseudonym, when you had already achieved a reputation under your own name as a writer?" I asked Mr. Baker.

"It was all quite natural," responded Mr. Baker. "I had joined with several friends, Miss Tarbell, William Allen White, Peter Dunne and John Phillips, in buying the old *American Magazine*. It was a great adventure. We were all working for as little money as we dared take out of it. I was, of course, writing articles on public questions, on politics, economic and other problems, which I thought then was the most important work.

"One day we had an editorial conference and one of our editors asked each of us to stand and deliver everything he had in the way of possible copy. I began to think over what I could do. I have always made a practice of keeping notebooks like the little sketch books of the artist. It seems to me as necessary for the writer to sketch and sketch as for the artist. I had written down stories and incidents of my life in the country, which all along had been peculiarly real and vivid to me, for, with the exception of a few hard early years in the city, I have lived all my life in the country or in country towns.

"Well, when the editors began pressing for more material for publication I looked into these old notebooks. I found I had far more of them than I realized. So I turned a number of the sketches into possible stories and essays, changing the names of people and places and sent them in, quite secretly. To my astonishment, all the editors, though only one of them knew who had done the writing, seemed enthusiastic. To my still further surprise—a surprise that I cannot get over even yet—the public also liked them.

"We began to get letters immediately and the series became more and more successful. So I kept on writing. Because I was already publishing a series of articles in the magazine, it was thought best that these sketches and stories should appear under another name. I chose the name of "David Grayson," because I thought it fitted the material.

Ten Years of Anonymity

"I CALLED the first series 'Adventures in Contentment' and in 1907 it was published in book form. I made two contracts with the publisher. One was under my own name and the other, which was for the office files at the publishing house, was made under the name of David Grayson. This was done to preserve the anonymity.

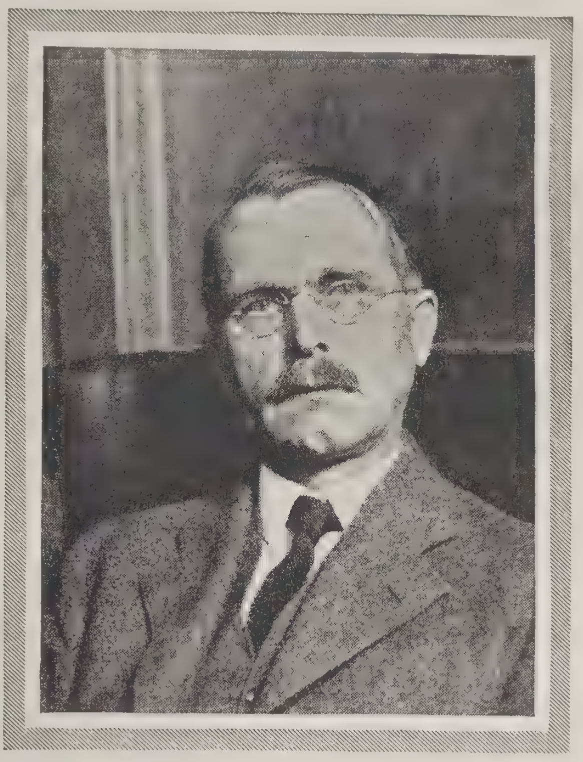
"It was 10 years, from 1907 to 1917, before the general public knew of the authorship. In the meantime, the stories were widely circulated, not only in America but in England, Australia, New Zealand and elsewhere.

"What do people say, when they come to meet you?" I interrupted.

"Most people think they are going to meet some old fellow with a long white beard," came the reply.

Of the five books published under the pseudonym of "David Grayson" the first volume, "Adventures in Contentment," has had the largest sale because it has been on the market longest. The other volumes are "Adventures in Friendship," "The Friendly Road," "Hempfield" and "Great Possessions."

The David Grayson stories portray the plain joys of life. For him the growing crops, the rains of spring, the aroma of the fresh-turned furrow of land, the companionship of the woods and the simplicity of living in the country, have a charm that transcends the mad rush and the breathless haste of the city.



RAY STANNARD BAKER

In the world of fiction he is known as "David Grayson."

"I cannot convey the sweetness and softness of that landscape, the airiness of it, the mystery of it, as it came to me at that moment," writes David Grayson in one of his books. "It was as though looking at an acquaintance long known, I should discover that I loved him. As I stood there I was conscious of the cool tang of burning leaves and brush heaps, the lazy smoke of which floated down the long valley and found me in my field, and finally I heard, as, though the sounds were then made for the first time, all the vague murmurs of the countryside—a cowbell somewhere in the distance, the creak of a wagon, the blurred evening hum of birds, insects, frogs. So I stood and looked up and down with a glow and a thrill which I cannot now look back upon without some envy and a little amusement at the grandness and seriousness of it all.

To Be a Graysonian

"THUS I was born into the present world, and here I continue, not knowing what other world I may yet achieve. I do not know, but I wait in expectance, keeping my furrows straight and my corners well turned."

Such is the philosophy that saturates the Grayson books. Lovers of Grayson have formed many "Grayson Clubs." Their creed is: "To be a Graysonian is to be found in the open air, to love the stretching road, the sun on the shoulder blades, the golden riot of the autumn leaves; to slip away from everything and go a-wayfaring with joy for a comrade."

Mr. Baker is country bred through a long line of ancestors, each generation of which has sought the frontier—first in Massachusetts, next in Vermont, then in Western New York, when it was a wilderness, and finally in Michigan. Here Mr. Baker was born at Lansing, April 17, 1870. When he was five years old, the family again sought the timber belt and settled in Polk County, Northern Wisconsin, in a settlement 40 miles from a railroad. Here the family—which included many children—still lives and here David Grayson occasionally returns for a visit.

"Americans seem to have had an instinct for the frontier, moving forward with each generation," philosophizes Mr. Baker. "I wish they had as strong an instinct for the frontier in intellectual things."

When the Baker family moved to Polk County there was another New England family living on the banks of the Kinnickinic River a few miles to the south in which was also a boy destined to win a great reputation as a writer—the late Bill Nye, the famous humorist, whose mother died there but two years ago. The Nyes were from Maine and one of the boys, Frank M. Nye, later a judge and member of Congress from Minneapolis, taught a term of school at St. Croix Falls, which Ray Stannard Baker attended as a pupil. Still farther south, near La Crosse, was growing up at the same time still another boy who also was to make himself and Wisconsin famous in literature—Hamlin Garland. This trio of writers may be said to have been products of the pioneer conditions of Wisconsin and representative of their spirit.

There were trying times for these early pioneers—sacrifices to be made that the sons might obtain an education. Mr. Baker went to the Michigan Agricultural College, afterward to the University of Michigan, working his way and obtaining a degree in 1889. Returning, he was in business with his father for a time, but finally the urge for writing took him into the cities as a reporter. He worked in Chicago, then as managing editor of the McClure syndicate and in 1899 became associate editor of *McClure's Magazine*. He was one of the owners and editors of the *American Magazine* in 1906, a position he held until 1915.

During the earlier years, necessity required that much of his time as an editor be spent in the city, but he soon returned to the country, first in Michigan then in New England.

Twelve years ago, he bought a plot of ground at Amherst, Massachusetts. It is in the Connecticut Valley, rich alluvial lands productive of tobacco and onions. Here he has his garden, his orchard, his field, his bees.

Mr. Baker has one of the largest correspondence circles of any writer in this country. Traveling up and down the states these many years, he has formed an acquaintance with many leaders in varied lines, besides the friendships made through his books. He has retained his deep interest in Wisconsin, and returns every year for a visit. Two of his sons have been sent back to Wisconsin to attend college.

Official Visitor to Allies

DURING the World War, he was delegated by the Department of State to visit Great Britain, France and Italy and to make reports on certain conditions in Europe that did not find their way to the United States Government through official channels.

When the war was over, he asked for leave to return, but was appointed by President Wilson to be director of the American Press Bureau during the Peace Conference. Out of this relationship has come the three-volume history, "Woodrow Wilson and the World Settlement," issued November 1, and published simultaneously in the United States, England, Germany and Czecho-Slovakia.

"I hoped President Wilson would write a history of the peace conference," said Mr. Baker. "America did not know of the difficulties which confronted its delegates at Paris, and above everything, if America is to lead in the world, she must understand international problems. But the President was ill and finally said to me: 'You do it. I'll turn over all my papers to you and you write it.' While attending the conference, he had kept on his desk a steel box, and into it each day went all of the documents of that day's proceedings. When the box became full, it was emptied into trunks and these trunks were then sealed and returned to the United States.

"These documents were all turned over to me for the preparation of my volumes. For two months I worked at the White House, later in the home of President Wilson at Washington and completed the task at my Amherst home. All the documents, secret and otherwise, have been at my disposal."

Mr. Baker is deeply concerned over the attitude of America toward foreign affairs. He sees for America a great opportunity for world leadership and world service, if only she has the vision to see the greatness of the task, and her own duty in connection with it.

Mr. Baker declares that it is not necessary for an author to live in the East or to be near publishers to promote his literary success. He does believe, however, that there must be more or less leisure for the production of thought-out or artistic work.

Asked as to his most interesting early experience as a newspaperman, Mr. Baker said that his expedition to Turkey a score of years ago to interview Ellen Stone, the missionary, who had been kidnaped by Bulgarian brigands was as exciting as any. At the time of the kidnaping, Mr. Baker was in London, being then a member of the *McClure's* staff, when he received a telegram from Mr. McClure directing him to hurry at once to Turkey. It was an order like that of James Gordon Bennett to Henry M. Stanley to find Livingston.

The Trouble With Writers

"MISS STONE had been captured by the brigands and was held for a ransom of 100,000 Turkish pounds," said Mr. Baker recently. "Just as I arrived in Salonika, she was being brought out, the ransom having been paid. She accompanied me back to America. Her experiences proved to be a great story."

Unlike many writers, Mr. Baker has no affectations, airs, frills or idiosyncracies. He is natural, normal, wholesome, straightforward, and meets one as man to man. His company is comfortable, interesting, and would no doubt be most instructive enjoyable and delightful on a friendly road.

With all these years of success as a writer, Mr. Baker has words of encouragement and suggestions for the beginner. Practice is the secret.

"The trouble with young writers is they don't write enough for themselves," admonished Mr. Baker. "They don't sketch, they are not willing to throw away what they write; and if they do sketch, they fail to keep at it. Too many of them write with an editor always in mind. The true writer will write for himself and not for the editor, and not, primarily, for the public. He will write because he must express something inside of him that will not keep quiet."

Taking Gamble Out of World's Chief Food

How Storage Plan Properly Worked Out to Care for Surplus Wheat Would Solve Many Problems Both for the Farmer and Consumer

By HERBERT J. BROWNE

This is the last of four articles by Mr. Browne, taking up the dependence of crop conditions upon the weather and discussing the possibilities of a drought. Mr. Browne also offers a suggestion designed to do away with the possibility of famine.

IN PRECEDING articles the weather conditions which menace the world's food supply have been given, with numerous examples drawn from ancient and recent history, to prove the advisability of making provision to insure all peoples against a shortage or failure in their daily bread.

Insurance is no new idea. It is applied in every direction. Nearly half the adult population of the United States carries some form of life, health or accident policies. The main apology in these modern times of disillusionment for the maintenance of huge armies and navies is that they "insure" the country against invasion. Good foundation, then, is there not, for presenting facts in favor of assuring a steady and ample bread supply to all the world? Especially if the very operation of the plan will be not only self-sustaining, but of great and direct benefit to both producers and consumers?

The great tides of propaganda which flood the country are all financed by special interests and generally look to the establishment of legalized special privilege. Let a proposition of universal good be advanced, and the whole organized force of special interests propaganda will be turned loose against it. The three tests of the merit of governmental expenditure, within its legitimate field, are: First, universality of benefit; second, efficiency of administration, and third, economy of expenditure. If the general public could see the result of governmental investment which they pay in taxes there would be some startling changes. *The late Tom L. Johnson said that if the increased values which would come to city land from running street cars free could be taken in taxes, it would bring in twice the income which car fares amounted to; and that there would be no more sense in collecting car fares than in collecting elevator fares in an office building.*

How Stabilization Will Aid

THE absorption of perhaps 100,000,000 bushels of wheat annually would involve the co-ordination of the present elevator capacity of the country to supplement a certain amount of government construction. Elevators on a large scale can be built with proper headhouses for 25 cents per bushel capacity. So less than the cost of a superdreadnought will represent the maximum permanent annual investment, and that one which under sound management will pay dividends on the investment and will last a hundred years, instead of being like the dreadnought a constant heavy expense, obsolete within a few years and then fit only to be scrapped or sunk as an experiment in new forms of destruction.

The present elevator capacity of the country is, in country elevators of which there are some 22,000, not counting farm granaries, 550,000,000 bushels; 350 terminal elevators, 250,000,000 bushels; and 7,000 mills have capacity for 150,000,000 bushels. These cover the storage of all grains and aggregate about 1,500,000,000 bushels. Their systematized co-ordination would increase their average annual working capacity, which is of course well below the total figures, from the flow of grain from its sources to the mills and terminals. But it is a matter for good industrial engineering.

The secondary but more immediate benefit, especially in this country, will be the stabilization of grain prices, the lack of which has made the grain raisers the victims of market manipulation to the extent of billions of dollars. Price stabilization in wheat will favorably influence the prices of other grains. Nor will it injuriously affect retail prices to the customer, for between producer and consumer every intermediate handler takes a wide insurance against fluctuations in prices of his raw material and his finished product, and that means in the end as high a price to the consumer as he would be called upon to pay with the price of wheat stabilized, probably even higher. With the French Government controlling the French wheat and flour market, the people of France get better and much cheaper bread than the people of any large American city, and yet the French bakers are still using the most primitive hand methods.

Price-fixing Exists Now

IT IS time that the bugaboo of danger in price-fixing be laid. The Federal Government price-fixes the pay of some 600,000 civil, military and naval employes. Add state and local officialdom, including public school teachers, and pay-fixing extends to as many more. Pay-fixing now includes more than a million railroad employes. Several million members of labor unions have practically established the same principle, and the difficulties of doing anything else have made wage stabilization the practical and desirable system. Now as to other services the government price-fixes the carrying of the mails. A two-cent stamp will carry an ounce letter. The government makes many of its revenue charges specific and not ad valorem.

In the business field scores of articles of a trademarked character are sold at fixed and guaranteed prices, and the Supreme Court in a broad way has sustained the principle. Despite all the laws against "combinations in restraint of trade," the public pays fixed prices, with hardly more than long-range seasonal fluctuations, on nearly every important staple it buys.

The Interstate Commerce Commission spends most of its time in fixing prices for railroad transportation.

The Federal Trade Commission spends most of *its* time principally in trying to keep rival businesses from slashing each other's throats by unfair methods in which price-cutting is generally an important component.

Nine-tenths of the shoes produced in this country are made on machines owned by a single corporation and rented to all manufacturers on a standard price-fixed royalty basis.

The justice of the plan is not argued; this is simply a statement of fact. Every farmers' and fruitgrowers' association in the country maintains a representative in Washington, the crux of whose employment is to see that no legislation is enacted that shall be construed as limiting the right of members of those organizations to combine for the purpose of fixing uniform prices.

Periodicals all have fixed subscription prices and generally standardized advertising rates. Every well-established store prides itself on its one-price operation. If the spirit of common service and mutuality is not plain to all who study the vast and complicated mechanism of modern production and exchange, what interpretation is to be given the great and growing co-operation of insurance, in which each individual insured is protected against undue and crushing loss by the mutual support of the whole body of the insured.

With revolving funds in successful operation in connection with the great western irrigation projects, no defense need be offered in behalf of this project which means protection, equal and without distinction as to station, to every man, woman and child in the United States, against the threat of food shortage from crop failure.

On the economic side, the blow which has already fallen upon the farming community passes belief. Inability to pay interest on mortgages, let alone curtailment of principal; the foreclosing of chattel mortgages, the tax sales, the withdrawal of children from schools, even the closing of public schools; the abandonment of farms; the pouring of the younger rural population into the cities, all bear unmistakable testimony of the plight of once prosperous communities. The evidence in unpainted buildings, the decline in replacements of necessary farm machinery are further proof. No well-meant schemes of "making country life more attractive," fostered with movies and rural dances, touch the problem. It is fundamentally one of economics, of inadequate returns and too heavy burdens.

The Percentage in Days of Old

ONE illustration will make clear the fact that the farmer of today is not sharing fairly in the vast industrial advantages which should come to him in the modern development of multiplied power through steam, electricity and other modern machinery of production—that in reality he has gone back beyond the fair divisions of 50 years and a century ago. *The writer's grandfather was a small country miller and farmer in a little New Hampshire farming community. In his small boyhood he had seen his grandfather take toll for grinding wheat. The miller had a measure which held one-tenth of a bushel of wheat, and that was his toll. He delivered back nine-tenths of each bushel of wheat in bolted flour, middlings and bran. Such a measure used for half a century in a country mill at Lodi, New York, is now in the writer's possession.*

In the year just past, a western farmer hauled his wheat to the local elevator and sold it at 90 cents a bushel. He bought his flour at an average of $8.35 a barrel, his middlings for stock feeding at $32 a ton and his bran at $28. There are 44 pounds of flour, 12 pounds of middlings and four pounds of bran in a bushel of wheat.

A few moments' figuring will show that the farmer is buying back his 90-cent wheat at $2.09 cents a bushel; that, instead of paying a toll of one-tenth for having his wheat converted into flour, middlings and bran, a toll of 5.7 is taken, an increase of 570 per cent over the toll of his grandfather's day, in face of all the advantages which modern machinery, mechanical handling, improved processes and the almost infinitely multiplied energy of steam and turbine-driven water power, are supposed to have distributed throughout the whole organization of society.

The farmer is voicing his discontent. The government in Washington so far will do anything for the farmer except lift from his back its unjust burdens. His taxes are out of all proportion to his share in the national income, and they are even now rapidly being increased.

There have been scores of commissions set up by Congress or the executive departments of the government to investigate nearly everything under the sun. Their reports have run into thousands and tens of thousands of printed pages. In the final summary the pith of any one of those long-winded and costly documents could be condensed into a few hundred words. Here is the meat of one exhaustive inquiry into the return of the wheat farmer for his investment of capital and labor in the production of wheat. By five-year periods, beginning with 1865, and basing the figures on the purchasing power in terms of what the farmer buys, an acre of wheat in 1865 would represent $13; 1870, $10.50; 1875, $10; 1880, $12.50; 1885, $10; 1890, $12; 1895, $10; 1900, $10; 1905, $12; 1910, $12; 1915, $15; 1922, $8.

During the latter half of 1920 the average price of 10 leading crops dropped 57 per cent and by May, 1921, the average price was only one-third that of the previous June. By November, 1921, the average dropped below the 1913 level. In Iowa the farm price of corn had become one-half that of 1913, and one-fourth that of 1919.

The statisticians for the Census Bureau and the Department of Agriculture find that farmers constitute 28 per cent of the population classed as gainfully employed, and they find that they receive only 17.4 per cent of the national income, which is admitted to be, by subtraction presumably, 10.6 per cent below a fair, adequate, living return. These figures need another analysis from a sounder and more practical basis. The population distribution figures of the last census showed 63,273,843 persons living in cities and villages, plainly the non-agricultural population, and 42,436,776 living in the country. The latter number can safely be put down as representing the farming community. On a farm everybody works, down to the children who do chores before and after school and put in full time during vacation, which falls principally during the productive summer months. The writer speaks from lifelong personal contact and experience. So, then, there are slightly more than 40 per cent of the population receiving 17.4 per cent of the national income, a much more unfavorable showing than the official estimate—actually about 43.6 per cent of their fair share. No wonder boys and girls are leaving the farms and flocking to the cities.

Shrinkage Hits Hard

THE way price shrinkage has struck the farming community is well set forth in the following official statement in regard to the course of wheat prices under government control taken from the Year Book of the Department of Agriculture, 1921:

"After the United States entered the war in April, 1917, steps were taken to regulate the distribution and the price of wheat. The Food and Fuel Control Act of August 10, 1917, guaranteed a minimum price of $2 per bushel for the crop of 1918. On August 30, 1917, the President fixed a minimum price for the 1917 crop at $2.20 per bushel for No. 1 northern spring and its equivalents at Chicago, with differentials for grades and markets. Through the operations of the United States Grain Corporation this became the basic price for wheat. The average farm price of the whole country remained at a level of about $2 per bushel throughout 1918. By an executive order on June 21, 1918, the price of wheat was raised to $2.26 a bushel for No. 1 northern spring and its equivalents at Chicago. In the spring of 1919 wheat prices rose sharply, reaching $2.31 on May 1, but declined under pressure of large acreage and large production to about $2.10 by October 1. With decreases in acreage and estimated production, prices rose rapidly thereafter, reaching $2.58 on June 1, 1920, a month before the government guaranty of a minimum price was terminated. General deflation began soon afterward and continued to the end of 1921, when the price stood near 90 cents."

Average Annual Loss Is Third

NO OTHER industry could suffer the seasonal losses which attend the operations of agriculture and survive. The following tabulation taken from official sources shows the great damage which wheat has suffered in recent years from climatic and other causes:

	Drought, Hot Winds	Other Climatic	Total Climatic	Diseases, Insects, etc.	Total Losses
1910	21.5	8.5	30.	3.8	33.8
1911	29.3	3.0	32.3	5.4	37.7
1912	9.9	14.1	24.	5.5	29.5
1913	15.9	4.1	20.	3.5	23.5
1916	7.6	13.6	21.2	17.5	38.7
1917	20.7	13.7	34.4	1.9	36.3
1918	16.6	5.8	22.4	3.3	25.7
1919	15.2	9.1	24.3	3.3	37.6
1920	9.6	8.0	17.6	4.6	32.2
				Average	32.7

While the presentation of these articles has been limited to development of the idea of conserving wheat, the principle of stabilization by storage is capable of indefinite extension. The enormous growth of the canning industry is the most practical illustration of benefit to the public from preservation of important food products, as well as wiping out of seasonal limitation in variation of supply. The development of refrigeration plants is another example. Refrigeration

Interest Has Cost Uncle Sam Seven Billions!

That's What Our Government Has Paid for "Privilege" of Borrowing

By JAMES MARTIN MILLER

SINCE 1791 the United States Government has paid out in interest $7,225,854,905. Since the same year, or for 131 years, the government has paid out for soldiers' pensions $6,389,192,671. So it will be seen that Uncle Sam has paid $836,662,234 more in interest to the holders of government bonds than he has paid in pensions to his soldiers that fought in all the wars he ever had.

There has always been opposition of the most powerful kind against the payment of pensions. *But there has never been any opposition to the payment of billions of interest* to the leisure class. In fact the principal opposition to paying soldiers' pensions or bonuses comes from the non-producing class, renowned as professional tax dodgers. But the government, when it receives your taxes, turns over a good percentage of it for the interest due to the bondholders. We have, in this country, about one million men in whom the bulk of the great wealth, in the shape of the liquid cash of the country, is bunched. Many of them do not even own a home, they are hotel or apartment dwellers. They keep their wealth in the confines of a safety vault.

There are fully one million individuals in the United States who live off the interest that the other 110,000,000 people pay. In 1922 this one million received in interest from public debts alone—national, state and municipal—$1,329,485,410; 1,086,899 pensioners, 547,016 soldiers, 256,918 invalids and 282,965 widows of soldiers received about one-sixth of the amount paid out in interest on public debts, or $253,807,583.37; amount paid out in interest (1922), in excess of amount paid for soldiers' pensions, $1,075,677,826.63.

No one, not even the officeholders and the politicians, seems to make any objections to the billions paid out in interest on public debts. They will make a political issue of much more trivial matters than the colossal interest burden and really get the country quite stirred up over them.

In 1914, the year the World War started, the United States paid out $22,801,000 *for interest* on the net public debt of $967,953,310. In 1919 the "high water mark" of debt and interest, in all our financial history, was reached when we paid out *in interest* $1,052,334,000 to the holders of $25,234,496,247 worth of our bonds and other obligations.

It will be remembered that some of the bond issues of the government were selling in "the market" at a considerable discount below par, or what the people paid for them. The speculators and money sharks reaped a rich harvest buying up these bonds. There was a time, a year or so ago, that Liberty bonds were selling as low as 84 on "the market." Indeed some of the small holders, hard pressed for money, were forced to sell their bonds as low as 80, and perhaps less. Treasury Department officials explain that when the government went into "the market" (which means the New York Bankers and Brokers) to purchase its own Liberty bonds and Victory notes, it did so to give stability to "the market"; in other words, to buy them on such a large scale that it would bring up the price to par at least. In doing this the government made a profit of $89,378,275.41 on the purchase of $1,965,791,450 worth of bonds (par value) for $1,876,413,174.59. In other words, the government bought these bonds and notes for $89,378,275.41 less than it received when it sold them to the people.

If the speculators and money brokers bought the bonds as low as 84, on an average, they made a profit of at least $23,206,515.09, in selling them to the government. That is, the people, who were the original subscribers and purchasers, received $112,584,790.50 less than they paid for them.

As the provision of the law providing for such purchases of bonds on the part of the government expired on July 2, 1922, there will be no more transactions of this kind by the government.

Two classes of bankers criticised the government for selling bonds at par and then buying them in at a discount. One class is the Conscientious Bankers, who think it is dishonest for the government to buy up its obligations at a discount, which, from their view, amounts to a repudiation to the extent of the discount from the price the people paid. *It certainly is considered dishonest for the individual, or private corporation, to do this for the purpose of fleecing the public, to their own gain.*

The other class of bankers who criticise it is that class of bankers and brokers who thrive by beating down the prices of bonds and securities. Their criticism is purely selfish. This class felt that the price of government bonds had not been beaten down low enough by their professional manipulations, so they could gather in a richer harvest in fleecing the helpless people, who, as patriots, bought these bonds to assist their government in the stress of war. Such bankers and speculators would, of course, have been glad to have seen the bonds go down to 50 for they well knew the government must eventually redeem them at par and meet the interest coupons as they fall due. This class possessed the money which would have enabled them to hold the bonds. *It is this class of money brokers who always encourage issues of government, state and municipal bonds so they can speculate in them and manipulate them at the expense of the people and the taxpayers for their own benefit.*

In every city, more so in New York than elsewhere, are elaborate offices of stock bankers and brokers whose sole business is "buying and selling" bonds and stocks. From every city they have expensive leased telegraphic wires connecting with their main offices in New York. Many of them make a specialty of government, state and municipal bonds, as well as other securities. This class of monied men is actually more powerful and influential with the National Government and the municipalities, by far, than the people they are living off of by exploiting them.

AN EXHIBIT OF NATIONAL AND LOCAL PUBLIC DEBTS AND INTEREST

Total interest paid out by the Federal Government since 1791	$ 7,225,854,905.00
Since 1791 the government has borrowed	278,109,690,969.46
Since 1791 the United States has paid back	255,145,611,796.46
Interest-bearing debt of United States, 1922	$ 22,964,079,200.00
Total debts of the 48 states	1,071,506,978.28
Total debts of cities, counties, and so on	7,428,494,021.72
Total public debts of all kinds (1922)	$ 31,464,080,200.00

TABLE SHOWING INCREASE OF STATE AND MUNICIPAL DEBTS

In 1880 state and municipal debts amounted to	$ 1,123,278,647.00
In 1890 state and municipal debts amounted to	1,137,290,090.00
In 1902 state and municipal debts amounted to	1,864,978,483.00
In 1913 state and municipal debts amounted to	3,821,896,658.00
In 1922 state and municipal debts amounted to	8,500,000,000.00

This class of securities is exempt from Federal taxes. It taxes the people for the interest, but pays no taxes in return. This fact is a very great factor in making local government securities popular with the investors.

Of this constantly increasing debt of the municipalities, New York City, the headquarters of the bond and security sharks, owes $1,292,973,059 and paid interest in 1922 amounting to $55,144,736. The debt of New York increases each year. Philadelphia ranks second as a debt-ridden city. Detroit ranks third. Detroit's descent into the debtor class has been rapid and recent. Some cities have a habit of covering up their real indebtedness. Cincinnati, Ohio, with less than half the population of Detroit, for instance, has about the same amount of debt. But the political bosses in Cincinnati, as in certain other cities, seek to hide their real indebtedness from the people by a system of bookkeeping. The Federal officials do not accept, in the government reports, the methods of Cincinnati and certain other cities in considering their debts. But the private and commercialized financial publications report the financial condition of that city at about 60 per cent of its actual indebtedness.

Some other cities, to make a favorable showing to the voters and the people, cover up their real indebtedness in a similar way. If the United States Government should deduct the value of Federal buildings in Washington and all over the country, or public lands, it could, by ingenious bookkeeping, easily produce a statement that would indicate that the entire national debt had been wiped out. But this would not liquidate the bonded indebtedness and the interest payments would have to be made just the same.

If the ratio of increase, as shown in the table above, continues for 10 years, we shall have debts of states, counties and cities totaling $16,000,000,000 or more; in 20 years, $33,000,000,000 and in 30 years fully $66,000,000,000. There is an alarming tendency on the part of officials, encouraged by investment and interest brokers, to resort to bond issues for public improvements. When business is prostrate, a bond issue is floated to give work to the unemployed, but a very small proportion of the proceeds of such issues, interest and all, actually go to the men who do the work.

It loads these men who do the work, their children and all the rest of the people for generations, with such a burden of debt and interest that the little temporary wages they receive is negligible. Consideration of this fact should awaken not only the working people, but all the people to examine very carefully any bond issue proposed for their vote.

Bond issues have become a vicious habit in recent years.

Out of the Valley of the Shadow

Concluded from page 8

The policy which was constantly kept in mind when introducing industrial vocational courses for the blind soldiers was to establish as far as possible such trades as offer two fields of employment: Those which can be used either as unit industries—that is, independent, one-man businesses—or as occupations, in which employment can be obtained in factories or shops. In the first instance the man would operate a small business of his own in the capacity of owner and manager; in the second, he would work at the trade in the capacity of an employe.

In selecting unit industries that are peculiarly adaptable to this group of men the organizers of the school had an extremely difficult problem to solve. There are certain iron-clad requirements that such a business must meet, otherwise it would not be at all satisfactory for a person handicapped by the loss of his sight. Some of these requirements are, briefly:

1. The business must not be complex.
2. It must be easy to start.
3. A small amount of floor space should do.
4. The operations and transactions involved must be as few and as simple as possible.
5. The equipment should not be complicated and difficult to operate.
6. Only a few different kinds of raw materials and supplies should be required.
7. The possibility of location in any section of the country, as the boys come from different states.
8. A demand for the product or service.
9. Permanency.
10. Possibilities for future expansion and growth.

It is readily appreciated that there are very few industrial undertakings which meet all these requirements.

Of the four unit industries established at the school, vulcanizing, a store, a cigar factory and a poultry farm, the store and the poultry farm have proved to be the most successful, the blind young men being better able to adapt themselves to these two classes of work.

The course is very complete and a number of boys have left the school and are now successfully conducting stores in different parts of the country. A significant example is the Chapman, Allen & Company's stationery and bookstore at Grand Junction, Colorado.

Chapman came to Evergreen in January, 1919, and left in January, 1920, completing in that short time courses in Braille, typewriting, music, business correspondence and commercial work. Allen came in February, 1919, taking a special course in store management, and leaving with his buddy, Chapman, to start in business.

Let me draw your attention to the fact that the men at Evergreen learn these trades and businesses in about one-fourth the time that is usually supposed to be necessary to teach a blinded man a trade. It was explained that the principal reason for this is to be found in the free employment of blind teachers.

"The whole outlook of a man becomes different when he finds himself in the hands of a teacher who works under a handicap the same as his own," explained one of the blind teachers. "We also kept some of the earlier pupils as teachers. It may readily be imagined how stimulating must have been the effect on a newly blinded man who found his first fumbling efforts directed by one who himself was blinded on the battle fields of France but a few months before."

Another reason for this remarkable speed in acquiring the trades lies in the splendid spirit of cheery determination which pervades Evergreen, and in the fact that these men are, with the exception of the loss of their sight, hale, healthy, normal individuals.

Beyond the workshops and the store is situated the poultry farm. Here an almost untried industry for blind persons has proved itself to be wonderfully successful. The men are taught poultry keeping on practical and up-to-date lines.

While Evergreen is primarily a vocational training school, aiming to prepare its students to make a living in certain lines of commercial, industrial and agricultural pursuits, it does not neglect health, citizenship and that part of the 24 hours devoted to amusement and recreation.

Blindness renders these men unable to enjoy many of the sports and pastimes indulged in by the sighted, but a hobby or avocation will not only furnish self-entertainment but, in many instances, is a source of revenue and of great satisfaction. The avocational work may be a source of income or it may not. The concern is not that it pay, but that the men be prepared to obtain diversion from their main task of life by working at some avocation.

Among the avocational courses from which the Evergreen students may choose are the following:

Bookbinding
Basketry
Bee keeping
Chair caning
Hammock making
Insurance
Music
Poultry keeping
Rug weaving
Woodworking

It can readily be seen that the men whose vocational work is in the industrial or commercial world will do well to make poultry raising, for example, an avocational study, and the man who is specializing in agriculture many times finds music, basketry or woodworking an excellent pastime. As a matter of fact, many of the vocational courses lend themselves admirably to avocational work.

Well-equipped double bowling alley, large swimming pool, commodious and well-furnished gymnasium and nicely appointed social rooms, have been provided.

Let's Have Arbitration—But Cut Out Politics

"Permanent Court" at The Hague Offers Little Hope of Permanent Peace

By A. R. PINCI

AFTER a spell of obscurity, The Hague, famous in recent years because of its so-called Peace Palace built by a native Scot with American money, is not only pre-empting front-page space in the newspapers, but, if political rumor may be credited, the next presidential campaign will include endless haranguing about a new stunt that, according to all precedent and experience, is of no importance or efficacy whatsoever.

The latest scheme is a "Permanent Court of International Justice" at The Hague. A similar but defunct body, upon which the new one has arisen, was the "Permanent Court of Arbitration" in the same city. This court and similar bodies have been decisively frowned upon by the Senate of the United States, which justifies the Senate for wanting the Harding proposal to join the Court of Justice to go over until the next session.

It is because of the probable injection of politics and political cant, not to mention the inclusion of some nationally known names, that the American people should accept declarations about the new court not upon the perfervid basis of its advocates, but upon anteceding facts, as well as a few obvious inconsistencies between facts and promises. Not that the new court is intrinsically dangerous, but that it cannot be half so useful or adequate as officials would have one believe, is the point.

Indorsed If Without Teeth

IF THE writer fails to share the enthusiasm of Court of Justice advocates it is because diplomatists, who make the vital problems that no international court of justice or arbitration will be permitted to adjust, have coolly ignored it. It was my premature publication of the approximate text of the famous Knox arbitration treaties, which came to my exclusive attention during their formulation, that enabled the Senate of the United States and interested foreign officials to get their first slant of a subject that for eight or ten days, through my instrumentality, was the chief center of discussion in London, Paris and Washington. The Senate refused to accept those treaties in the manner desired by President Taft.

The Senate has always been adverse to arbitration treaties and international courts involving arbitration, and those which have been ratified are of no material importance. No Senate has ratified treaties of this kind except upon absolute proof from the Administration that certain questions and interests were excluded from its operation. Foreign powers have adopted the same policy. It is clear, therefore, that arbitration tribunals are accepted only when they lack teeth. The new Court of International Justice does not warrant, by custom and experience, political attention. Injecting it into politics must be regarded with suspicion as a trick.

When Elihu Root was Secretary of State, in 1907, he said that the Permanent Tribunal of Arbitration should be "of such dignity, consideration and rank that the best and ablest jurists will accept appointment to it, and that the whole world will have absolute confidence in its judgment." Unfortunately, it did not have the confidence of aggressive statesmen then in power and the project failed for many reasons, tritely covered under the blanket explanation that no agreement could be reached with relation to the selection of judges.

How The Hague court, irrespective of whether it is for arbitration or justice—these are denominational changes involving costly quibbling—can or will function now, with the world a dozen times more topsy-turvy than it was when the Second Peace Conference was held, no one will presume to explain. The peace treaties arising out of the war hardly commend themselves to any one as a sample of successful arbitration.

That the Court of Justice is a revamping of the Court of Arbitration is pathetically hinted at by President Harding, who states in his message asking the Senate's consent to our adhesion to the protocol "that it is not a new problem in international relationship."

It is because it is not a new problem, and it is because it has always failed of a satisfactory joint solution in the past under less harassing circumstances, that one must deprecate the threat of politics and political nemesis.

"It is wholly a question," President Harding has said, "of accepting an established institution of high character, and making effective all the fine things which have been said of us in favor of such an agency of advanced civilization. It would be well worth the while of the Senate to make such special effort as is becoming to record its approval. Such action would add to our own consciousness of participation in the fortunate advancement of international relationship, and remind the world anew that we are ready for our proper part in furthering peace and adding stability in world affairs."

Except in wording, the sentiments therein expressed differ not a whit from those expressed, in connection with The Hague tribunals and arbitration, by Presidents Roosevelt, Taft and Wilson. But the abyss between mere words and sordid facts is vast.

The Court of Justice can no more further peace than it can hasten war, and this applies, or applied, of course, to the previous arbitration court. It has been officially declared that no country is likely to war *except on issues which involve its honor or its vital interest*. If issues are excluded which lead to war then it is not clear how any court of justice or arbitration can prevent war.

It was Mr. Taft's intention, as president, to negotiate arbitration treaties which were embraced between that super-sphere of excluded issues and that lowly sphere of issues which local diplomatic envoys are usually empowered to settle. The point actually aimed at by pro-arbitration statesmen is to arbitrate anything and everything that is of no extraordinary importance. One of the foremost diplomats of Europe, who was my mentor in diplomacy, frankly told me two decades ago what Mr. Taft said a few years afterward—that arbitration is not going to be feasible until nations enter into it with a willingness and probability that the decision may be unfavorable. "We cannot win every case," Mr. Taft said, "nations are like individuals; they are not always right, even though they think they are, and if arbitration is to accomplish anything, we must be willing to lose and abide by the loss." It is due to this fact, however remote or irrelevant it may appear, that issues "of honor or vital interest" are excluded. This may be denied, but I have the authority of European statesmen that a nation may likewise be wrong in such issues of honor or vital interest. Accordingly, arbitration is objected to because between two powers of approximately equal standing, militarily and otherwise, force is less likely to be used than between two powers of unequal rank, with the result that the lesser will somehow be coerced into submission. and often injustice, even when in the right. The fateful term "justiciable" is so conditional as to make it a perfect alibi.

As, in any event, each nation is free to determine what is a justiciable or is not a justiciable question, it is obvious that any tribunal like the one suggested is a mere anomaly, despite its possible good effects and results. But such results can be attained between any two contestants actually desirous of settling mutual differences, and in case of a tie, so to speak, they are free to call an arbitrator, or umpire, to settle it.

Goes Back to 1907

COMPULSORY arbitration or justiciable procedure is an international impossibility. Any supplemental organization is redundant, and there is no denying the fact that every government has now more officials and more commissions and "courts" than are necessary or advisable. Adding one more is a loss of time and effort.

The Imperial Russian Government, which originally advanced the compound suggestion of disarmament and arbitration 25 years ago (during our war with Spain to be exact), has been obliterated. Today the world has not advanced, despite President Harding's belief, toward the elimination of war or the application of peace. It is nonsensical statesmanship, freely indulged in periodically, to attempt to build up the very court that has defied man's ingenuity, application and intention. The United States rejected what other nations rejected. Mr. Harding as Senator would have joined in the shelving of the very court he is now advocating—and he frowned upon the attempts of President Wilson to establish a similar organization.

It is getting nowhere to adhere to an international court which can be joined not for the good it is supposed to do but for the lack of specific authority it has. It is writing the same history of 1907, more or less. Although Mr. Root is actively identified with the new as he was with the old, there has been nothing forthcoming from him to show that substituting the word Justice for Arbitration is the solution of a problem which he had the power and probably the authority to settle when he was Secretary of State.

A useful suggestion for every reader, which will lead to a better understanding of the subject, is the peculiar but eloquent fact that these international court plans, past or present, for justice or arbitration, are advanced and advocated by jurists or lawyers, regardless of temporary public office, occasionally aided by ex-officials.

Dyed-in-the-wool diplomatists and front-rank statesmen, especially those who are running the governments of the more important nations, have never made a single positive statement that will justify one to believe that international tribunals can be made effective.

The writer would like to see a list of foreign notables who, actually identified with the business of running their respective governments, are on record in favor of international arbitration that will not only arbitrate but accept signatories to abide by the decision. Their utmost concession has been with regard to petty matters that any superior local court could settle as well and probably more speedily.

Despite a very fair personal acquaintance with statesmen who have almost run the world during the past 20 years, I cannot recall a single one who answers the foregoing description.

It is not because they are war-lords, or because they are selfish, or because they are intolerant; not at all. It is simply due to the fact that the present nationalistic method of running a country, or governing a people, precludes co-operation under the egis of an international tribunal. The United States has subscribed to this doctrine. Whether it will ever be changed is problematical.

What It Must Be

BUT that is not all. An international court must of necessity be constituted of nations which are interrelated in various ways, politically or economically, and although the judicial members exercised superhuman logic, it is difficult to escape the psychology of superior force. The advantage always rests with the great powers. It may be harsh but it is so. That was one of the reasons why the League of Nations failed to impress the Senate, yet, and this is worth noting, the very men, officials and others, who are advocating the new court are the same men who favored the League of Nations, with or without reservations. The only exception is Mr. Harding himself.

President Harding may not know it, but his advocacy of The Hague Court of Justice which, so far as he is personally concerned, has no political outlet, at least at this time, has made him more popular with the pro-Leaguers. What this will mean is both interesting and disconcerting.

International courts never have been an issue in presidential campaigns before. Whether the campaign of 1920 hinged upon international courts is admitted by some and denied by others. It is to be doubted that it can legitimately figure as an issue in 1924.

There is danger, however, that cant and volubility may lead the people to imagine that the International Court of Justice is greater and more vital to our welfare than it actually is, and in case of defeat by the Senate, to attempt to prove that the Senate is anti-international peace or some such thing.

Secretary Hughes, in his letter to the President, states that "from its foundation this government has taken a leading part in promoting the judicial settlement of international disputes," but that is different from the "international judicial" settlement of disputes. Arbitration processes are not denied to the Government because of The Hague courts, old and new.

The American people have had only one experience in genuine arbitration, and that was at the now almost forgotten Portsmouth Conference between Russia and Japan. No international tribunal like The Hague court could ever have reached or imposed the compromise that the representatives of the former enemy powers amicably reached among themselves on American ground.

Where there's a will there is a way—but two-thirds of this talk about international courts, judging from past experiences and results, is nothing but talk.

Let's have arbitration—but cut out politics.

Taking Gamble Out of World's Chief Food

Concluded from page 10

levels the peaks and fills the hollows of production. It ships fresh meat from Australia to London, and enables the fresh fruit harvest to lap round the year.

But none of these industries privately controlled contemplate storage beyond a seasonal demand.

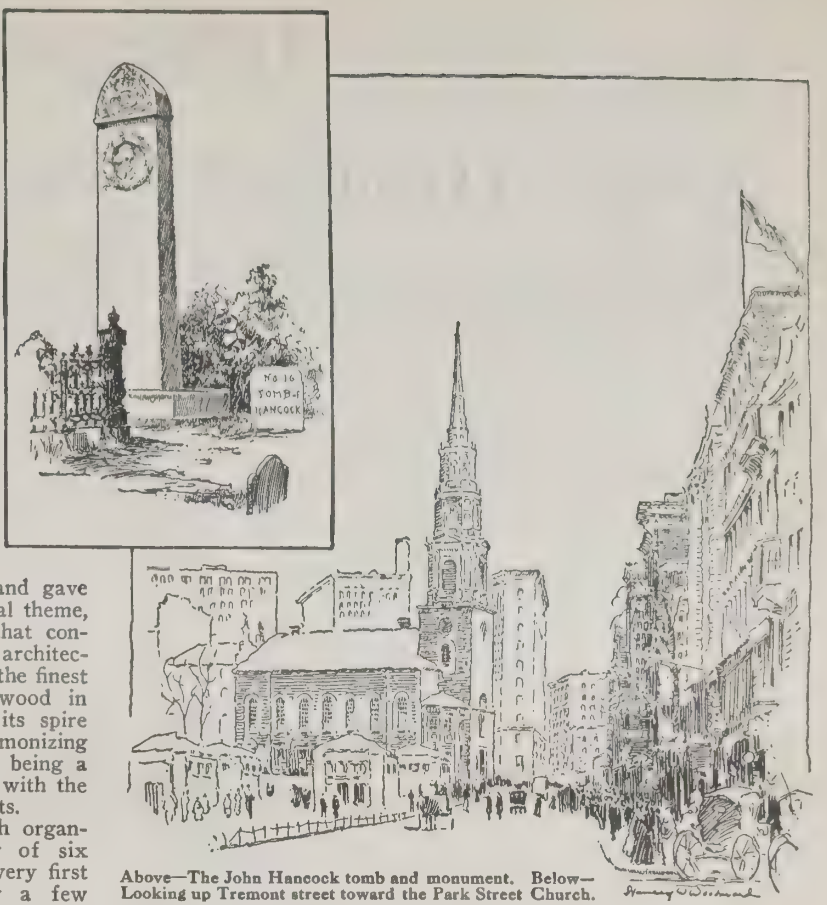
The coal strike of 1922 furnishes so conclusive an argument for the extensive municipal storage of at least one winter's supply of anthracite, and of even larger accumulation at the points of use of soft coal, that no other plan can weigh with it. Apart from its protection to the consuming public, its effect on both operators and miners in the direction of production agreements would be valuable. That the smoothing out of both production and distribution would lead to a lessening of the cost of coal to the consumer is obvious. It is seen in all the larger commercial and manufacturing operations, where the customer who can give steady and permanent orders can always get preferred treatment. The lack of steadiness, the wide fluctuations of production in the building industry are principally responsible for the present high cost of building. Every element, from the timber and brick to the pipe and plumbing, every human interest from the architect to the bricklayer and carpenter, have to charge all they can to make up for the carrying costs of the long intervals of idleness.

But the very nature of the expected annual production of the great grain staples has confirmed the world in its hand-to-mouth improvidence of dependence in the matter of food. In every other direction thrift, anticipation of future need, has become ingrained habit, but the day succeeds the night; in the spring the grass is green and in the autumn the harvest comes. Nature forces the farmer's hand. He has to plant or his food factory lies worse than idle and produces of its own volition injurious crops. But compelled to till, the farmer faces the unseen enemies of the air. He cannot say—yet—: "This year the drought will destroy my wheat. I will at least save my seed and labor." Perhaps that day is not far distant when his meteorology can be read ahead. But this is certain, even now he measures his crop planting, especially where he has diversified farming, by the returns of the previous year, and at present it is not encouraging. In the end the public pays, and pays heavily, for all great price fluctuations depending on the rise and fall in the levels of food production. The public is forced to gamble whether it will or not, and the cards are dealt by professional operators. It is time the gamble is taken out of the world's chief food, in which to lose is to insure disaster.

Park Street Church, Bulwark of Puritanism

Nine Who Withdrew From Old South in 1808 Founded What Well May Be Termed Boston's Hub

By MAY B. WHITING



Above—The John Hancock tomb and monument. Below—Looking up Tremont street toward the Park Street Church.

IN THE period of spiritual depression that follows every war, there are always a few souls not content with formalism and who seek earnestly the vision. Park Street Church in Boston is the result of such a striving at the close of the Revolution and it remains the most distinctive building in the city. Beautiful in situation and in the loveliness of its perfect spire, it rises with a sweet and gentle pride that is quite Bostonian, too, as if perfectly aware that for miles around there is no spot so dearly cherished. "Brimstone Corner," as the scoffers used to call it, may well claim to be the exact center of that hub which Boston fondly fancies itself to be.

When the Revolution was over, the Puritan faith that had accomplished such marvels seemed almost dead. During the war the Old South Church had been used as a riding school and pistol gallery for the British cavalry, and now it reopened decidedly "shaky." And yet it was the only church in Boston which made any claim to the old doctrine. Unitarianism was spreading, but many were turning to it, not inspired by its spirit of brotherly service, but as a relaxation from the old duties. In all the city there was no mission work, distribution of Bibles, midweek service, weekly religious publication, or Sunday school.

In 1808 nine zealous souls withdrew from the Old South, resolved to start a church which should teach again the faith of Calvin, a last bulwark, if need be, of Puritanism. A year later they formally organized, still with less than a score of members, under the leadership of Rev. Dr. Morse, of Charlestown, father of the inventor of the telephone, and Dr. Holmes, father of the beloved "Autocrat of the Breakfast Table." Plans were made for raising funds and land purchased for a church edifice.

At that time Boston had much the appearance of an English shire town. Tremont and Summer streets were residential, with colonial mansions such as are still standing in Salem, and fine gardens and shade trees. The town crier daily made his rounds, announcing an auction sale of hay or the arrival of a shipload of rugs or figs from Smyrna, and tavern signs swung above the cobblestones over which the coaches rattled as they made their start by lantern light at two a. m.

The old town granary was still standing on the lot opposite the Common which the new church purchased. In the early days of the colony this building served to hold about 12,000 bushels of grain to meet the needs of the poor, but of late it had fallen into various uses, from being the home of the ragpickers to storing secondhand furniture. At one time it was a sail loft and the sails of the frigate *Constitution* were made within its walls. But every one was glad to see the ramshackle affair dismantled and the foundations laid for a new building.

The architect was Peter Banner, an Englishman, but the Ionic and Corinthian columns of the spire were the work of a Bostonian, Solomon Willard. The model was Saint Bride's in Fleet street, yet the new structure far surpassed the London church in beauty and harmony of design. The motif is found in the medieval churches of Italy and was brought to England by Wren and Inigo Jones. But New England gave a further adaptation of the classical theme, a grace and lightness of touch that constitute our real contribution to architecture. And Park Street Church is the finest example of the Renaissance in wood in the country. The gradations of its spire rise in subtle charm, each harmonizing deftly with the others, the whole being a continuation of a tower, connected with the main building by pillared quadrants.

No sooner was the new church organized than it became the sponsor of six important movements. From the very first it was a mission church. Only a few months after its dedication it ordained the first workers of the American Board of Foreign Missions and a few months later organized the church of the Sandwich Islands, with several natives present. In 1817 it started one of the first Sunday schools and about that same time began to hold meetings in the cause of temperance which resulted in the formation of societies all over the country. In 1829 William Lloyd Garrison, then not 24 years old, gave his first public speech in Boston against slavery, Whittier being in the audience, and in 1849 Charles Sumner delivered his famous address, "The War Systems of Nations," before the American Peace Society which held its meetings there. And with all these reforms there was much preaching of the old doctrine of work and prayer, not forgetting fervent mention of "the wrath to come," so that the title, "Brimstone Corner," was given partly in derision and partly in admiration.

But the most beautiful of Park Street works is its gift of music. It was the home of the Handel and Haydn Society, the oldest musical organization in the country, except the one at Stoughton, Massachusetts, and none other has done so much to make the classics the common enjoyment of all. It was the pride of merchant, clerk and society belle to sing in its chorus with accompanying orchestra, which at first consisted of flute, bassoon and violincello, and sufficient reward for going out in all weathers for rehearsals, to sing in its concerts with the finest soloists in the country in the leading parts. It was at a children's festival in Park Street Church on July 4, 1832, that *America* was first sung, under the direction of Boston's favorite music master, Lowell Mason.

Adjoining the church on the north is the Granary Burying Ground, which was set off from the Common in 1660. Here sleep some of the city's most honored dead, well pleased, if the love of Boston still persists in heaven, that their ashes repose under the shadow of Park Street steeple. Although fronting on one of the busiest streets, the plot has an air of seclusion, elevated some three feet above the sidewalk and shut in, as it is, by an iron fence with granite entrances, the heavy carvings of which suggest Chaldean arches.

In the center of the burying ground is a marble pyramid erected to the parents of Benjamin Franklin. That thrifty soul could not neglect so good an occasion to point a moral to succeeding generations, and the epitaph he composed is surely worthy of a passing glance:

Josiah Franklin and Abiah his wife
lie here interred.
They lived lovingly together in wedlock
fifty-five years.
Without any estate or gainful employment,
By constant labor and industry,
with God's blessing,
They maintained a large family comfortably,
and brought up thirteen children
and seven grandchildren
reputably.
From this instance, reader,
Be encouraged to diligence in thy calling
And distrust not Providence.
He was a pious and prudent man;
She, a discreet and virtuous woman.
Their youngest son,
In filial regard to their memory,
Places this stone.

In the southwestern corner is the steel shaft erected to the memory of John Hancock, first governor of Massachusetts and first signer of the Declaration of Independence, and, just in back, a humble slab marking the grave of his servant Frank. Two other signers are buried here, Samuel Adams and Robert Treat Paine; seven governors, several of them officers of the crown; also John Phillips, first mayor of Boston, John Bailey, pastor of the first church, and James Otis, patriot orator of the Revolution.

Here is the dark rectangular monument of Chief Justice Samuel Sewall, that staunch old Puritan whose conscience smote him sore for helping hang the witches, and near by the grave of his father-in-law, John Hull, the "mint master" who made the pine tree shillings. Paul Revere lies in the old burial ground, also Peter Faneuil and Rev. Pierre Daillé, minister of the Huguenot church in Boston, together with other members of his congregation. The victims of the Boston Massacre of 1770 lie in an unmarked grave, and near the Tremont street railing is the grave of young Woodbridge who, in 1728, was killed in a duel on the Common.

According to an old Boston tradition, or perhaps it is a myth, Mother Goose lies in this cemetery. A seventeenth century matron, Elizabeth Vergoose, is supposed to be this immortal friend of childhood, and more than one antiquary, poring over the stones, many of them crumbled beyond deciphering, has thought to locate her grave.

If truth be known, the pilgrim at this shrine must be content to honor the dead in general assembly and not localize his homage too precisely. For stones will crumble and fall to the ground and there have been city officials whose ideal was to find a convenient way to have the grass moved. It was after a stroll in this burying ground that Holmes made his classic remark about the wholesale illustration of the old reproach, Here *lies,* "where the stone does lie above and the bones do not lie beneath."

But they are all there somewhere, a grave and goodly company, the Puritan dead of Boston, their little gray stones peering up like so many monitors, bidding the city hold fast its ancient glory. On one side of their green valley is the church, and two others are shut in by high business blocks, but there are no advertising signs to mar the dull gray of the walls and outrage the sensibilities of the worthies assembled there.

In fact, there is a certain air of comfort and good taste and old gentility about the Granary Burying Ground, and, in spite of its fiery name, there is no air of gloom about the church, or any appearance of having outlived its usefulness. The dark stones that mark the graves are only a foil to bring out the cheerful red of the brick, toned by time into a soft and mellow hue. Beneath the church, the windows of a bright tea room and gay flower shop add vivid touches of color, and the lovely spire, rising in slender grace above the trees of the Common, smiles contentedly down on the passers-by, never for an instant forgetting that it helps adorn one of the finest corners in the world.

Things in the Making—MATCHES

ALTHOUGH it was discovered by Godfrey Haukwitz in 1686 that sulphur and phosphorous would ignite by friction, it was not until 150 years later that this discovery was applied to matches.

At the beginning of the nineteenth century the common method to produce a spark was the striking together of flint and steel, the sparks falling on tinder, such as the carbonized fragments of cotton and linen.

It was in 1827 that the first true friction match was evolved by John Walker, of Stockton-on-Tees, Durham. In 1830 imitations of Walker's matches were made and put on the market under the name of "lucifers."

Today, the manufacture of matches has assumed gigantic proportions in many countries, principally Great Britain, Norway, Sweden, Japan and the United States.

The New International Encyclopedia, speaking of the way matches are made, says:

"The first step in the manufacture of large, ordinary and safety matches is to prepare the splints from blocks of pine from which all knots and cross-grained portions have been removed. This wood comes in the form of planks two inches thick and is thoroughly dry. Then it is sawed into lengths of from one and seven-eighths to two and one-half inches, or the length of the ordinary match.

"A man now receives these blocks and they are cut by knives or dies into rows of splints, each row containing splints for 44 matches. Each row of splints, as it is cut from the block, is placed on cast-iron plates which are formed into an endless chain. The splints are now carried over a drying or heating block, where they are heated so the melted paraffin may not become cold on the exterior of the stick, but may saturate the end thoroughly.

"The paraffin and the composition which form the head of the match are placed in proper receptacles, which are automatically replenished without stopping the machine. Through these the splints pass.

"As the chain carries the bundles along, the matches are cooled and dried by blasts of air, and finally they are automatically removed and packed in prepared boxes.

"One such machine will yield 100 gross of boxes a day and requires the attention of eight girls. The boxes, which are made by automatic machinery, too, are fed into the machine automatically, and, after receiving their contents, are discharged on a rotating table, where they receive their covers at the hands of girls, two to four being employed at each table.

"The use of automatic machinery also is applied to the manufacture of the so-called book matches, where strips of cardboard, separated so as to form individual matches, are bound in cardboard cases with a striking surface. A machine prints the cardboard, cuts it into combs, dips the ends in the igniting mixture, folds it, stitches it into books, and fixes to the outside the striking composition.

"These book matches, which have found wide vogue, especially for advertising purposes and for pocket match safes, date from about 1899."

The Soaring Prices One Meets in Germany

Ruhr Occupation Has Terrific Effect in Bringing About Collapse of Mark

POSTAGE, like everything else in Germany, has soared to giddy heights since the French occupation of the Ruhr. When I came to Germany, shortly after the Armistice, it took only a 20-pfennig stamp to send a letter to America. Now it costs 750 times that much. This communication to The Dearborn Independent, double letter-weight, requires 225 marks postage. A single letter of the regulation 20 grammes weight, less than an ounce (1 ounce=28 1/3 grammes) to a foreign land costs 150 marks, and each additional 20 grammes an additional 75 marks. A domestic letter costs 50 marks.

The 20 pfennigs, which a foreign letter formerly cost, was equal to 5 cents at the normal rate of exchange. The 150 marks, which a foreign letter now costs, is equal to $37.50 at the normal rate of exchange, and the postage on this letter to The Dearborn Independent (double weight) represents a normal face value of $56.25. It would be just the same in America if the American currency had become so debased that instead of 5 cents it took $37.50 to post a letter to a foreign land. In such a case, of course, the cost of wages and everything else would also have enormously advanced. And that is just the way it is in Germany, though wages have not by any means kept pace with the depreciation of the currency. The trouble is that the cost of everything in Germany just now is far from normal because of the abnormal "flight of the mark."

4,500 Times Pre-war Figures

AS SHARP as is the rise in German postage it is not commensurate with the rise in other prices, which now average about 4,500 times the normal pre-war figures. That is the ratio of the paper mark to the gold mark—4,500 to one—meaning that it takes 4,500 paper marks to buy as much as a gold mark will buy. But the term "gold mark" is employed only as a symbol of measurement. No ordinary person ever sees such a thing. It has entirely disappeared from circulation.

In 1916 I made a little run into Germany from Holland. On the trip I spoiled the suit of clothes I was wearing, and in Hamburg bought a good ready-made suit for which I paid 60 marks. Before the war one could get a custom-made suit for that figure. Now it costs more than double the amount to post a letter to America. It is not enough to buy a daily German newspaper which costs 100 marks while the English newspapers sell for 2,000 marks and more a copy. Car fare on the street cars costs 150 marks. In Hamburg, on the trip above referred to, I bought a pair of good new shoes for 20 marks. Now it takes 100 marks to buy the poorest pair of cotton shoe strings. A box of matches costs 60 marks.

> *A loaf of bread bought with the bread card costs 1,000 marks; without the bread card it costs 1,600 marks. Before the war 1,000 marks would guarantee the household necessities and even the comforts of a worker's family for a year. In 1914 a thousand marks was sufficient to furnish a workingman's cottage completely. In November, 1921, the workingman could get only a kitchen cupboard for that sum. A year later it would buy only a pair of stockings. Now it is not enough to purchase a red bandana handkerchief. In 1914 a 200-pound pig could be bought for the price of an egg in 1923. Today a cake of wash-soap is sold for the same price that the farmer received for a good milch cow before the war.*

The mark has sunk so low that instead of being worth four to the dollar, as in former times, the American now exchanges his dollar for more than 50,000 marks. It takes 500 marks to equal one cent. So, as fantastical as the prices seem to the German, they are low for the happy possessor of foreign currency. That is why foreigners are again besieging Germany, and buying up everything they can get. That is why there has grown up in Germany such prejudice against foreigners excepting Americans who are ever held in the highest esteem.

Boycott Is General

FRENCHMEN have had to hurry out of the unoccupied territory because the hotels and restaurants refuse to serve them. The elevator boys refuse to carry them to and from their rooms. Cabmen will not haul them. A boycott has been placed on all that comes from France. No more French wines are drunk. No French wares are sold in the stores. The speaking of the French language is prohibited in all public places. French newspapers and magazines are no longer on sale. Such are some of the first consequences of the occupation of the Ruhr district by the French. What will follow no one yet can tell.

The Ruhr was the richest remaining part of Germany. Bonar Law has aptly termed it the jugular vein of German trade. After the losses of Alsace Lorraine, and the great Upper Silesian black country, the occupation of the Rhine and the Ruhr deprives Germany of the last remaining great ore-producing district. In the last three years the acceleration in the formation of vertical combines has given to the Ruhr its peculiar importance, since, without any outstanding exception, those combines have been erected and expanded on the Ruhr coal mines. Intensive development of manufacture and inner connections have been established on a scale of intricacy and power unparalleled elsewhere in European or American industry. Iron ore supplies have been established wherever iron could be found—in Sweden, Belgium, Hungary, Austria, Czecho-Slovakia, Spain and Algiers—to keep this central organization supplied with raw materials.

The Ruhr coal production in 1913 amounted to 114.8 million metric tons, or 60.4 per cent of the total German production. In 1920 it amounted to 88.2 million tons or 62.7 per cent; in 1921 to 94.1 million or 64.6 per cent, and in 1922 to 97.3 million. The production was 76.8 per cent of the pre-war output in 1920 and steadily increased to 84.5 per cent of the pre-war output in 1922.

The proportion of the Ruhr coal output to the entire British coal production amounted to 39 per cent in 1913; 38 per cent in 1920 and 56.5 per cent in 1921. It is evident, therefore, that if the entire output of the Ruhr were diverted from German industry to export and the rate of production were retained, the effect on British industry would be very serious. The total export of coal from Britain was only 25 per cent of the total output in 1913, 10 per cent in 1920 and 15 per cent in 1921. With this supply of coal from the Ruhr, France could hope to underbid Britain in the European markets and enter into direct competition in other markets hitherto regarded as purely British. Even allowing for German industry absorbing the usual amount of coal, there was a total export surplus of coal in 1920 amounting to 22 million metric tons and in 1921 to 25 million, of which at least two-thirds would come from the Ruhr. From this point alone the danger to the coal industry of England cannot well be overestimated.

In 1922 the coke produced in the Ruhr amounted to an average of 2.1 million metric tons per month, compared with a total German average of 2.4 million metric tons per month in 1821 and 2.5 in 1922. The total number of workmen employed in mining during 1922 ranged from 535,869 in June to 655,544 in October. The Stinnes industrial group alone employed 141,000 workmen in 1922; the Krupp group, 99,000; Klockner, 61,000; Phoenix, 46,500; Haniel, 40,300. The Stinnes group possesses in the Rhein-Elbe-Schuckert-Union 65 iron ore mines, 26 coal mines, 26 blast furnaces, 22 steel works, and eight rolling mills. The Krupp group possesses 37 iron ore mines, six coal mines, 17 blast furnaces, 15 steel works, 18 rolling mills. The Phoenix has one iron ore mine, five coal mines, 18 blast furnaces, 22 steel works, and eight rolling mills. The remaining nine groups own 42 blast furnaces, 37 steel works and 75 rolling mills. The whole iron and steel industry of Germany is practically located either in the Ruhr or in the region surrounding and containing it. In 1920 the 12 main groups produced between them 50 per cent of the total production of the Ruhr in coal and coke, so that this quantity can be considered as definitely applied to industrial apart from domestic uses. It is difficult to see how this can, under French occupation, be absorbed by the great iron and steel firms, and the probability is that this section of the Ruhr coal industry will cease operating.

Dependent on Ruhr for Coal

THE raw material—coal, iron ore, rolled iron and steel—supplies of German industry come from the Ruhr. The cut in the vertical combination in each group will tend to separate the manufacturing section from the raw material section which gives it life. Hence the seizure of the Ruhr must mean dislocation or interruption of industrial activities throughout Germany, even to the most distant parts, since many firms have spread out from this initial source of supply.

The whole of South German industry is especially dependent on the Ruhr for coal. The highly developed Thuringian industry has to rely entirely on Ruhr coal. Industrial Saxony and the great Berlin industries have looked to the Ruhr for their coal since the Upper Silesian supply was cut off.

The French occupation of the Ruhr has for its object the creation of a vassal state with a customs barrier along its German frontier. A "Rhenish franc" is to be issued to take the place of the German mark.

Six of the great German dyestuffs factories are in the occupied area. They employ 60,000 workmen and 12,000 chemists. They enjoy almost a monopoly on their output and hence can afford a franc currency. But managers and staff are unanimous in refusing to perform efficient work if it is to be only for French profit. Whether other branches of industry, with a customs barrier on the east and probably a still higher one on the west, can get along with franc wages seems very problematical.

What is the truth connected with the purchase of German property under the present circumstances? Is there really any money to be made by owning German houses or buildings in view of the fact that the dollar has such a tremendous purchasing power in Germany today? Can a foreigner actually "get something for nothing" in the Fatherland, or is the "get-rich-quick" talk all pure buncombe? Questions like these have been asked by many an American who has waited perhaps long and patiently for the chance to invest his savings in some kind of property and live on the income derived therefrom. And to pay only a few hundred dollars for a house and lot (whether it be located in Germany, China, or anywhere) that would cost many thousands in America certainly cannot be classed as "gold brick" speculation, whatever else may be said about it. On the face of it the thing looks good, and so it is that a very large number of Americans are property owners in Germany at the present time. But whether the thing is really as good as it looks on the surface will bear some close investigation. We shall examine the situation as it is in Germany today primarily to prove that the opportunities for any actual profit are not so rosy as they may seem to many an outsider.

To begin with, the real estate problems in Germany are somewhat different from ours. In the larger cities most of the people live in casern-like tenement houses built of brick covered over with cement. The size of these houses is regulated by law which differs in the various states but averages 30 feet deep by 66 feet front. Practically all of the houses are built one against the other with no space between, their dull gray masonry fronting the streets with a cold, monotonous sameness three to five stories in height. The rooms and windows are larger than those found in our houses of a similar type and the better houses of later construction have usually one apartment of six or seven rooms on each floor with all modern conveniences. In the older tenement houses occupied by the poorer classes, each floor is divided into two or more apartments. Only the very rich can afford to live in isolated homes or "villas" which are pretentious structures of stone surrounded by beautiful grounds, shade trees, shrubs, flower beds and well-kept lawns. While mansions like these are much in evidence in Germany, the beautiful little cottages or dainty bungalows which are so popular in the United States are almost unknown. The typically European—size and pomp—seems to predominate.

What It Means to Buy House

LET us say an American citizen has bought himself a house in Germany which the agent was originally authorized to sell for 15 million marks. At the present rate of exchange this sum translated into English represents about $500 which would hardly be more than a first payment on a home over here, while it actually PAYS FOR THE ENTIRE PIECE OF PROPERTY IN GERMANY. But the purchase can never be more than a speculation; it is certainly not a sound investment. Although $500 is not a large amount of money, it can, at least, bring in something every year in the form of interest at the savings bank, while invested in a house in Germany means that the owner henceforth becomes a heavy taxpayer, is put to the expense of upkeep, and so on, and receives IN DOLLARS AND CENTS no return whatever out of his "investment."

Furthermore, foreign buyers as speculators are not at all welcome in Germany; the former subject of the kaiser hates to see his property fall into the hands of foreigners, and one can hardly blame him. (Today's newspaper shows clearly enough the almost hourly loss of more and more German territory through the French inundation.)

But the principal objection to the owning of German real estate seems to be the enormous taxation to which every foreigner must hold himself accountable. Although this taxation to a foreign investor is not confiscatory, due to the abnormal exchange situation, it is, nevertheless, highly discouraging. Every kind of tax imaginable is levied on a piece of property, and the foreign owner has usually enough "extras" tacked on to the already long list, that the amount of the taxes payable may in time (should conditions become still worse, and there is every indication in this direction) total up to MORE THAN THE VALUE OF THE PROPERTY ITSELF! On top of all this, the government is about ready to pass a law preventing all foreigners from holding German real estate without special consent from the government. The main object is to prevent speculation in real estate by foreigners or by any persons operating with foreign capital, and it will soon be as hard for a non-German to buy property in Germany as it already is for a Bolshevik to emigrate to this country.

Little Benefit to Be Had

IN SUMMING up the situation, it will not be difficult to see that the serious-minded American can derive precious little benefit from the buying of German houses or buildings, and only a preying agent as usual gets out of it whatever there really is in the deal: namely, the commission.

But what of the future? Is there anything to the idea that this German property now on the market at a small fraction of its real worth will ever come to its own again when the mark is at last stabilized and conditions within the German nation become normal again? The most logical answer to this question is that it certainly ought to. But *when* will it? And *how* will it be done? A myriad of sweeping political and economic changes must first take place in the heart of the German nation before things will ever resume anything like normalcy again. Until then a lot of perfectly good American money is lying idle—and if the French should take a notion to seize the property, or worse yet, the Communists (German disciples of Lenin and of the Internationale) decide to divide it up and "share equally" with it—? These, of course, are questions which cannot now be definitely answered, and a very faint ray of hope remains that they may never arise for dispute. But the fact today is all too clear that the outlook in any direction is anything but cheerful; and the chances that anybody will eventually get "something for nothing" are practically nil. It has never worked out this way before and the chances are very good that in this particular case "wildcat" speculation has got the better of a great many people with perfectly good intentions.

City Moves to Make Its Artists Self-supporting

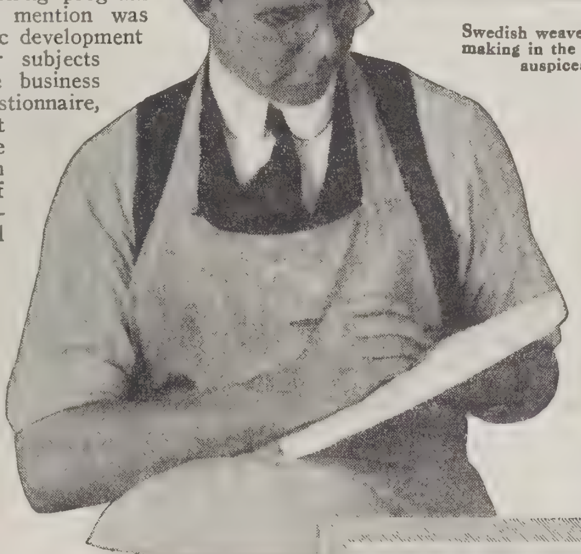
Berkeley, California, Through Chamber of Commerce, Acts to Take Art Out of Garret

By HARRY H. DUNN

CHARLES KELEER,

Of the Berkeley Chamber of Commerce, who originated the idea of devoting a part of the powers of the organization to the interests of art in Berkeley.

Swedish weaver at work on the all but lost art of tapestry-making in the co-operative art store recently opened under the auspices of the Berkeley Chamber of Commerce.



ROGER NOBLE BURNHAM,

Sculptor, chairman of the arts committee of the chamber of commerce of Berkeley, Calif.

TO TAKE art out of the garret, and give it an electric light instead of a candle, the city of Berkeley, California, through its chamber of commerce, has gathered the arts and the artists among its 65,000 inhabitants under its wings, co-ordinated their activities, given them opportunity to present their productions, and prepared for them an economic outlet for their painting, their sculpture, their music, their literature, their drama, and even their dancing. This is the first time in the history of business organizations that a chamber of commerce—usually devoted to the bringing of new commercial investments, new industries and new corporations to a city—has visioned the fact that art is as important to the growth of an American community, and to the development of its people, as is commerce or industry.

The idea originated in the mind of Charles Keeler, managing director of the Berkeley Chamber of Commerce, and, while he was developing the details, questionnaires were sent to each member of the chamber, asking a statement of those things which, in their judgment, should be incorporated in the working program of the organization. No mention was made of the idea of artistic development yet, among the 10 major subjects listed by virtually all the business men who replied to the questionnaire, was the advancement of art in all branches, and the making of Berkeley into an art center. The presence of the University of California, and other educational institutions in Berkeley, combined with its scenic location on the slopes of the foothills, and its remarkable climate, has attracted there hundreds of painters, sculptors, composers, musicians, writers and workers in other lines of art.

Realizing the presence of these artists, and the unusual demand from the business and professional life of the community that they be given an opportunity for advancement with the aid of the chamber of commerce, Mr. Keeler, himself a poet, dramatist and writer, inaugurated a movement having for its object the sustaining of these artists, through the distribution and sale of their products, so that they might be self-supporting from their own creative work, without being compelled to devote even a part of their time to teaching. Inasmuch as the arts embody manufactured articles which are the most enduring and the most prized objects of any civilization, they are as worthy of support by a chamber of commerce as are the cruder and more materially useful things produced in factories or imported in commerce.

"There is this essential difference between the manufacture of the utilities of life, and the manufacture of art objects," said Mr. Keeler in presenting the plan to the people of Berkeley, "that the former are made primarily for enriching the producer, while the latter are made because the artist has an irresistible impulse to create, whether there is an adequate market for his product or not. Nevertheless, the artist has the same needs and requirements for life as has the manufacturer of utilities. In all countries and in most ages, the poets, painters, composers, sculptors and writers have led a precarious existence, while particularly in America there are only a few who have had the support from the public necessary for an adequate livelihood from their creative work alone."

Thus Berkeley became the first American city to achieve the Continental plan, under which the arts not only are recognized, but are encouraged and assisted by the municipality. To do this, an arts and crafts committee was established within the chamber of commerce, and Roger Noble Burnham, designer of the University of California scholarship medal and of the heroic figures on the Memorial Hospital at Boston, was made chairman. Mr. Burnham himself handles and directs the department devoted to painting, sculpture, pottery-making and allied arts. The musical section is under the guidance of Antonio de Grassi, a composer and musician of note. The dramatic section is directed by Mrs. Burnham, who organized and conducted the Toy Theater in Boston, and, more recently, the Lanai Players in Honolulu. Mr. Keeler has charge of the literary division, and also attends to the maintenance of the close connection with the business, commercial and industrial interests of the city and the development of the art sections.

One of the principal factors which has held back the average American artist from full development, and prevented his giving all his time to creative work, is that he has had no economic outlet; that is to say, no effort has been made so to link the artist with the world of buyers that he may dispose of his production in such a manner as to earn a living wage. To assist the artists of Berkeley, and, in some degree, at least, those of all of Northern California, to bring their products into contact with prospective purchasers, the Berkeley Chamber of Commerce has sponsored the establishment of an art clearing house, or store, now in successful operation, to which these artists bring their paintings, their sculpture, their pottery, their weaving, their books, their musical compositions, to be displayed for sale. This store, which is in charge of J. Arthur Ward and Mrs. Nanna Boedker, also maintains direct connection with other art stores, privately owned, in New York, Boston, Chicago, New Orleans, Atlanta, St. Louis, Cleveland, Detroit, and virtually all eastern and southern cities, and ships to them on consignment the work of Berkeley artists.

An important factor in this liaison between art and business is that the prices of the artists' productions are held to a reasonable figure. That is to say, the arts and crafts committee of the chamber of commerce believes that art can be sold to the many just as well as to the few, if art works are not held at such exorbitant prices as is customary in most art shops. Thus, two persons are benefited—the artist, who obtains quicker and far wider sales for his productions, and the art lover of small means, who thus is enabled to gratify his desire for beautiful ornaments and works of art in his or her home, without emptying his purse.

The economic outlet for art work so established, however, is merely one of the avenues taken by the chamber of commerce to assist the producers of meritorious art work. The music section of the committee, under Antonio de Grassi, for example, has organized the Berkeley quartet, two violins, viola and 'cello with Mr. de Grassi as conductor, which is presenting a series of concerts of the best of the world's music in the auditorium of the Berkeley high school. These concerts extend well on into the spring at the nominal price of 30 cents admission. They are well attended. The dramatic section, under Mrs. Roger Noble Burnham, has organized a company of players and presented several dramatic productions to capacity houses at moderate admission charges.

Northern California composers who are assisting the Berkeley Chamber of Commerce in putting art of all kinds in the University City on a paying basis. Standing, left to right—Thomas Frederick Freeman, Eugene Blanchard and Wallace A. Sabin; seated, left to right—Antonio de Grassi, U. Marcelli, William J. McCoy and Frederick Maurer.

The Berkeley quartet, organized and led by Antonio de Grassi (at left), which is presenting a season of concerts of the best in music at the nominal admission price of 30 cents each, under the auspices of the chamber of commerce of Berkeley.

BRIEFLY TOLD

Fur-bearing and game animals are to be introduced on islands in Southeastern Alaska. Rabbits will be placed on certain islands as food for the fur bearers and man while other islands will be stocked with mink, marten and beaver and possibly elk.

One of Murillo's greatest paintings, "The Assumption," is hidden away in Guadalajara, Mexico. It is valued at more than $400,000 and is held by the church of that city. It is still in the city but has been hidden since the revolution.

The government of Switzerland has subsidized the potato-growing industry by contracting to purchase potatoes from the producers at from $1.71 to $1.90 for 220 pounds, delivered at the station of shipment, the government standing all transportation costs.

A new Mexican fiber known as "Malvavisco" is said to be a substitute for jute. This plant grows abundantly in the humid level lands near the rivers and at present is employed for making brooms. Experiments show this plant to possess qualities similar to jute and the cost of extracting the fiber is small. The fiber has been woven into cloth and it has an excellent silky appearance.

The International Labor Office reports that the following prices were in effect in Moscow as of November 26, 1922: Rye bread, .02 a pound; potatoes, .007 a pound; beef, .113 a pound; butter, .25 a pound; milk, .047 a quart; eggs. .18 for 10; sugar, .11 a pound; men's boots, $6.30.

Taxes on farm land have more than doubled during the past eight years. The average tax per acre in 1922 was 71 cents as compared with 31 cents in 1914.

The faithful Negroes who stood by their masters during the Civil War were voted pensions by the South Carolina legislature. The pensions are to be granted under virtually the same conditions as those now paid to Confederate veterans.

An ancient manuscript dealing with King Solomon and the Queen of Sheba contains the earliest historical reference to airplanes. The manuscript declares, "King Solomon gave the Queen of Sheba a vessel wherein one could traverse the air (or wind)."

The Biological Survey and the Bishop Museum of Honolulu are sending a scientific expedition to explore the Hawaiian Islands National Bird Reservation. The company will make collections and gather information concerning the bird life of the reservation which consists of a dozen or more islands, reefs and shoals stretching westward from the Hawaiian Archipelago proper for more than 1,500 miles toward Japan. The Navy Department is to furnish a vessel for the use of the party.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

In Schaerbeek, Belgium, is a small museum, dedicated to the remembrance of the eight women who were executed by the Germans during their occupation of Antwerp and Brussels.

Indians on Annette Island, Alaska, are buying an up-to-date fish cannery. The present owners have made an agreement which provides that royalties of from three to ten cents on each salmon shall be paid to the Indians and at the same time that supplemental royalties accruing to the natives shall be invested in the property so that absolute title will be acquired by them within five years.

The British Government is complaining of "wireless pirates." A wireless pirate is a person who has installed a wireless receiver set with the aid of a textbook and a little ingenuity. He is breaking the law for he has no license. He is committing an offense against the Wireless Telegraphy Act of 1904 and is liable to a fine not exceeding 100 pounds, and to 12 months' imprisonment. This tax on ingenuity, particularly in the case of the wireless, may react to the government's disadvantage in the future.

To keep within the budget, Cincinnati officials are utilizing moonshine whisky, seized by the police, as an anti-freeze aid for radiators of city automobiles, thus saving the expense of alcohol.

Professor Albert Einstein has resigned from the League of Nations.

An American motion picture operator, who had been taking films of the French-occupied area of the Ruhr, was pursued by the French but escaped in his auto to Berlin. There the film was developed and two copies were sent abroad. Now the negative is stolen by French agents. However, the operator has an additional copy and will make another negative.

Whales acquire barnacles the same as do ships. However, they do not cause the whale any discomfort.

Board of Trade members in Chicago are considering a novel scheme for raising money for a new building. It has been proposed to place a tax on all transactions on the exchange in the same manner that the pot in a poker game is "nipped" for the "kitty." However, the plan calls only for the loan of the money put in the kitty and regular interest would be paid.

A day of dense fog costs London nearly $5,000,000 in loss of wages, extra lighting, cost of delay, extra transportation and extra launderings.

The Santiago River in Mexico is the longest in that country. It rises near Mexico City and flows northwest to the sea emptying near San Blas. In the canyons 2,000 feet below the level of the surrounding plain, the Indian farmers find a super-tropic climate along the river banks where they plant their crops. The climate here forces vegetation as might an equatorial hothouse.

"Uncle Joe" Cannon, who is 86 years old and has served 46 years as a representative of Illinois in Congress, arrived in Chicago and said he was looking for a "job with a future."

The house at 48 Doughty street, London, to which Dickens moved with his young wife, Mary Hogarth, from Furnival's Inn, is to be purchased by the London Dickens Fellowship. The house will be used as a museum, in which are to be collected objects, books, pictures, and so on, connected with Dickens and his works.

Near the close of the New Year in Japan, the housewives get busy and inspect carefully breakfast, dinner and tea sets. Each piece of china or earthenware which shows a crack is singled out, and a new piece is bought in its place. Cracked china brings ill luck, according to the Japanese belief.

A municipal ordinance in Amsterdam forbids that one front door shall give entrance to more than nine flats, and one staircase to more than six flats.

In the United States alone we are now patenting inventions at the rate of 40,000 a year.

PROPAGANDA OR FACTS?

The world today is flooded with propaganda. There is a scarcity of facts. Pick up a magazine or newspaper and glance through it. Aside from local news—how much dependable information do you find?
That is why Henry Ford established

The Dearborn Independent—The Ford International Weekly

A non-partisan, non-sectarian weekly magazine, devoted to printing facts—a chronicler of the neglected truth.

Any Ford Dealer will gladly accept subscriptions or they may be sent direct, using the blank below.

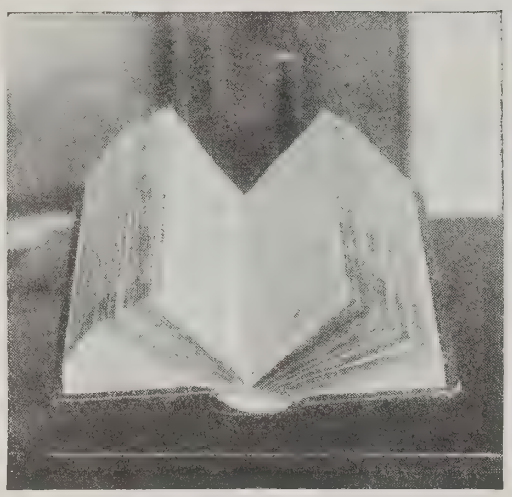
CHRONICLER OF THE NEGLECTED TRUTH

The 1,001 Wonders of Our National Capitol

Interesting Features and Curious Facts of Which Millions of Washington Visitors Seldom Hear



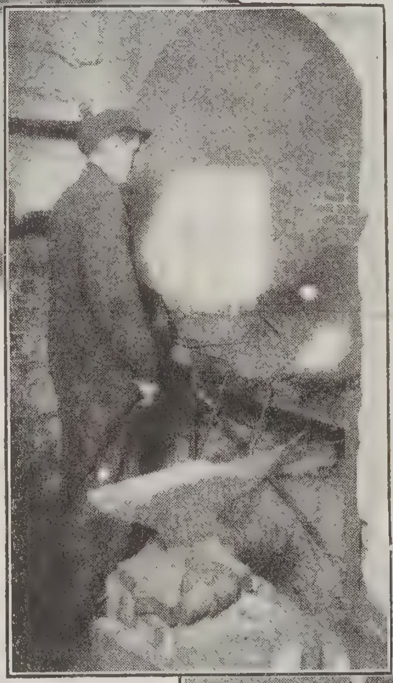
(C) National Photo Co.
The time-stained Bible that has been used since 1808 for swearing in our Presidents and judges of the United States Supreme Court.

THE average visitor to Washington—more than 600,000 motor touring parties visited the national capital during 1922—spends several hours or perhaps a half-day at the Capitol and then goes on his way believing that he has seen all that is worth-while in our most famous American building. As a matter of fact, he has hardly been introduced to the thousand and one wonders, mysteries, curiosities and rarities of this remarkable structure. A man—if there were one such—who could master all the teachings of the Bible in a single lesson might be qualified to view and appreciate the vast accumulations of historical lore which are housed under the great dome of our Federal legislative headquarters. Most of the travelers who come to Washington try to see too much in a limited period. They depart from our most beautiful city with conglomerate ideas about her magnificent distances, the Washington Monument, the White House, the Lincoln Memorial, Arlington, Mount Vernon, Rock Creek Park, the picturesque Potomac—but for the most part, they are deficient in detailed knowledge about any outstanding feature. A visitor could profitably spend a month of sight-seeing and study in the Capitol alone and still have much to learn. There are millions of documents in that notable building which a dozen men could not look over even cursorily in a normal lifetime. Almost every step which one takes brings into focus some object of interest intimately associated with unusual historical happenings. Our Capitol is a huge library of romance, history, art and architecture. It exemplifies American culture, refinement, industry, inventiveness, insistency and achievement. To Washingtonians who devote years of veneration and worship to this building, the ways in which sight-seers surge through her august halls and corridors resemble the excited rush of bargain hunters.

An expert repair man devotes all his time to keeping the 125 clocks in the Capitol in perfect order.

Most visitors never notice the number of clocks in the Capitol, some of which are more than 100 years old and have been the silent witnesses of stirring events which have made remarkable history. Altogether, there are 125 clocks in the Capitol. An expert repairman is hired by the year to keep this extensive system of timepieces in perfect order. He inspects and regulates each clock once a week. There is never any excuse for the Senators or Congressmen being late for engagements or committee meetings, for the Capitol clocks are always accurate to the fraction of a minute. The old clock in the office of the clerk of the United States Supreme Court is a patriarchal chronometer. The honorable judges of the session of 1837 developed the distressing habit of appearing at court sessions from 10 to 20 minutes late, with the excuse that their watches were slow. To remedy the trouble, Judge Story was authorized to purchase and install a clock by which the judges could regulate their watches. This clock has now been in active use for 86 years and still is the official timepiece which governs the opening and closing of the daily court sessions.

The time-stained Bible used by the judges of the Supreme Court is another venerable relic. Since 1808, all the chief justices and most of the presidents of the United States have been sworn into office on this Bible. Another object of great interest is the old desk used by the court reporter of the chamber. This desk was brought to Washington from Philadelphia when the national capital was permanently established in the former city. The judges of the Supreme Court still adhere to the old custom of using quill pens for signing all the important documents which originate in their chambers.



The blacksmith at the Capitol doesn't shoe any horses but he nevertheless rarely has an idle moment.

To most of us the idea of locating a blacksmith shop in the basement of the Capitol appears absurd until we are informed concerning the purpose which this shop serves. It may have dated back to the time when all the national lawmakers used to ride to the Capitol on horseback. Records show that on a number of occasions, Congress had to adjourn for several days during the spring flood season when the waters of certain streams and rivers in the neighborhood of Washington rose so high that horses were unable to ford them. The real purpose of the shop is to repair and keep in order all the metal work in the huge building.

The Capitol carpenter shop is an unique feature located in the basement of the House of Representatives' wing of the building where the millions of tourists and visitors never see it. The paint shop is a near neighbor of the blacksmith and carpenter headquarters while the chief electrician's laboratory is one of the busiest spots in all the government buildings. He has charge of the illumination of one of the largest buildings in the world in addition to operating the underground electric railway which transports the Senators from the Senate Office Building to the Capitol. Another subterranean carrier system has been established between the Capitol and the Congressional Library. Small cars are used to deliver books to the Senators and Congressmen. Each car carries 50 books a trip and makes about 25 round trips daily. As a result of this efficient electric messenger service, a book can be delivered to a committee room in the Capitol exactly four minutes after it has been ordered from the national library. A third tunnel connects the Capitol with the House Office Building. Electric cars have not been installed in this passageway as yet, although most of the Congressmen use the underground shortcut in going to the Capitol from their offices.

The Vice-President's room in the Capitol contains the famous Peale portrait of George Washington, said to be the best likeness of our first President ever painted. An old mirror purchased by John Adams in the early days of the Republic is another treasured relic. The records show that the United States Senate debated warmly and at great length when the bill for this mirror was presented. The sentiments of the body were that Mr. Adams had been needlessly extravagant in the purchase of the looking glass, showing that in the early days the national Senators were no more averse to wasting valuable government time in arguing over petty trivialities than they are today.

The document room of the House of Representatives probably contains more manuscripts than any other government office in Washington. There are more than 11,000,000 important documents indexed and filed away in the vault.

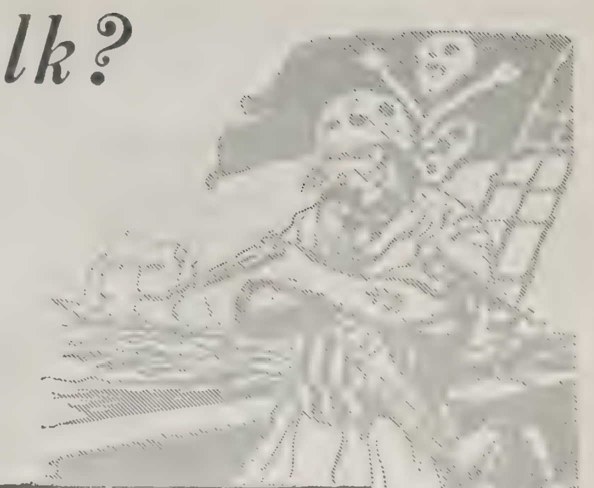
The Senators ride to the Capitol from their offices on subterranean electric cars.

Does the Pirate's Ghost Walk?



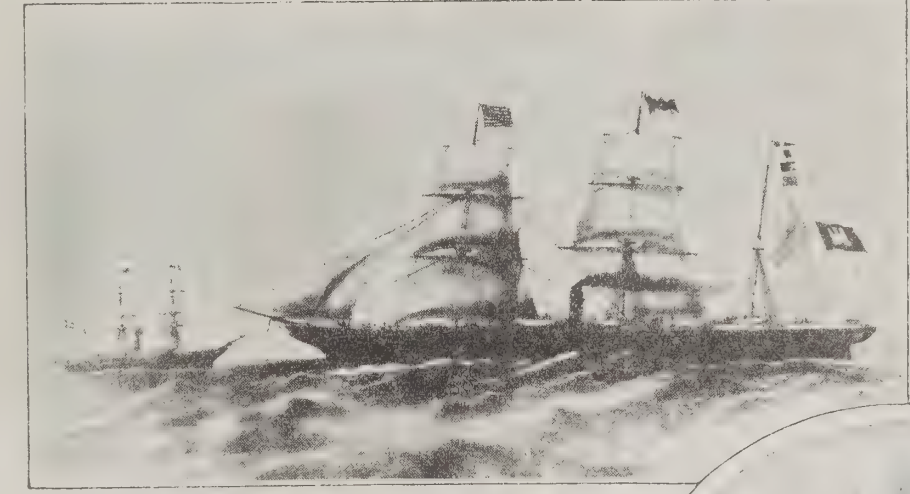
Unsolved Mysteries of Sea Found in Recent History; Many a Tale Which Might Be Told If Ships Would Come Back

By WALTER M. WOLFF

MOST of us will recall with a shudder our childhood visions of Captain Kidd, the pirate, and we are still likely to experience a 42-below chill at reading an account of the horrors perpetrated by such infamous pirates as Gibbs, perhaps the most notorious of the sea-butchers of the last century. Somehow or other we always enjoy a few moments now and then musing upon the deeds of the men who followed the sign of the skull and crossbones. And after we have mused upon them long enough, pirates, knives, teeth, black flag and other appendages connected with pirate lore go scampering away and out of our heads again.

Today we can plan our little voyage to Europe, to Hawaii, to the Philippines, to cherry-blossomed Japan—yes, to the ultimate corners of the earth, and not a thought enters our minds that we won't get to destination, quickly, safely and surely. We have every confidence that our modern water palaces will take us anywhere in the world now that the submarine peril and mine-field days have been filed and classified in the dociers of history. And to be sure, an ocean voyage of the twentieth century is about the most pleasant and inexpensive bit of recreation mankind has yet devised for its enjoyment.

One of the largest of the old five-masted schooners. Pirates of the last century took particularly keen interest in boats of this type.



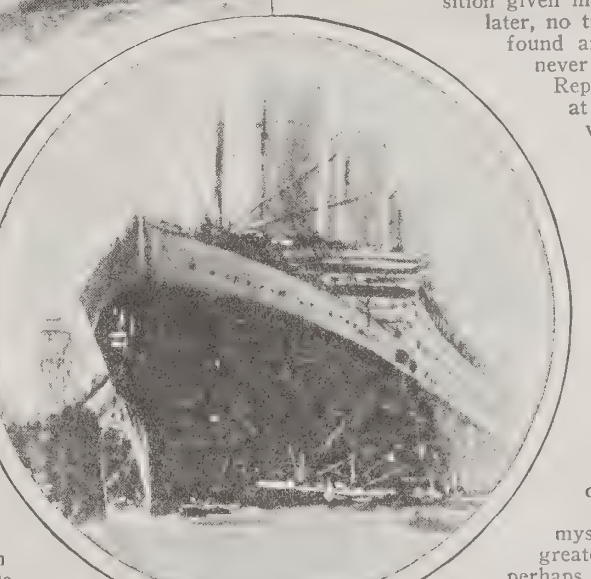
The Hammonia and Borussia, first steamers of the Hamburg-American Line. Vessels of this type began to make pretty fair speed under favorable conditions.

Not so long ago, however, far outside of the pages of Stevenson, Defoe, Poe and countless others who grew famous for the way they could stir up the marrow in our bones with their accounts of gold chests and sea rovers—even outside of the realistic screen of today, it was not such a cinch of a matter to make your steamship reservations, crawl aboard, and expect your trip to be one pleasant dream from the time you left the home shore until you landed off in far-away somewhere. Before ALL of the present-day safety devices now common to navigation the world over had been invented or perfected, many a fire at sea, many a leak in the hold, many a hidden iceberg, head-on collision caused by fog or darkness—very often even a mutiny on board, and then we mustn't forget the *pirates*—and last but not least of all those little inexplicable causes which together with what not else in the long list of possibilities for mishap, forced thousands of ships in the past to seek the unknown "shore" whence, of course, they never returned.

But among those whose fate has been determined definitely—among those which are known to have succumbed to fire, collisions, and other natural causes—there are certain ships whose final destination has been and probably always will be a total mystery. *There are ships that never came back,* and, furthermore, these ships have left us no trace whatever of what happened to them or to their crews. In the heyday of the pirate, we find, a clue in one form or another usually told the story of the disappearance of a vessel, and "MS in a Bottle" or a floating keg was all that was needed at the inquest. But recent history has a record of vessels which not only disappeared but which have left us with no trace at all *why* they disappeared. Time may unravel the mystery which surrounds the fates of the following ships; at any rate the cases were of such interest and importance that the United States Government took a hand in and is even *to this day* taking a hand in endeavoring to clear up the final facts connected with the unaccountable—let alone remarkable—disappearance of the vessels.

In the early spring of 1921 our government was startled by the news of the five-masted Bath, Maine, schooner, the *Carrol A. Deering,* piling up on the North Carolina coast in January with all sails set but not a soul aboard. At the same time, other ships were reported missing and belief that pirates were operating in the North Atlantic found actual credence after a bottle had been picked up north of Cape Hatteras containing a message purported to have been written by a member of the crew, one Henry Bates. Question as to the genuineness of the message was settled by handwriting experts who compared it with letters written by Bates.

Investigation of the case was immediately started on by both the Department of Justice and the Department of Commerce who had been at work already in the attempt to solve the unexplained disappearance of the American steel freighter *Hewitt,* out of Sabine Pass, Texas, for Boston. This craft disappeared about the same time that the *Deering* came ashore.



Our modern "big fellow," which always takes you there and back, with safety and comfort.

The summary of the history of the *Deering* case as sent to consuls by the State Department disclosed that when the *Deering* passed Cape Lookout lightship, North Carolina, on January 29, while bound from Rio de Janeiro for Norfolk, a man other than the master reported that the vessel had lost both anchors and asked to be reported to its owners. Five days later the vessel was found on the beach in what the State Department described as "in such condition that there is every suspicion of foul play having occurred." The summary went on to say that a short time after the *Deering* passed the lightship, a steamer, the name of which has not been ascertained, passed the light vessel and was asked to stop and take a message for forwarding, but no response was received to the "numerous attempts on the part of the master of the lightship to attract the vessel's attention."

The department's report then stated that on April 11 the following message was picked up in a bottle near Cape Hatteras:

"*Deering* captured by oil-burning boat something like chaser, taking off everything, handcuffing crew Crew hiding all over ship. No chance to make escape Finder please notify headquarters of *Deering.*"

"The schooner carried a motor lifeboat and a dory," the department's report continued, "but neither of them has been picked up and no wreckage from them has been found. Most of the provisions, clothing and supplies of the vessel had been removed."

Government agents investigating the *Hewitt* and *Deering* cases reported that they were baffled and that they were unable to find *a single clew* which might help to solve the mystery.

Puzzling as is the foregoing account of the disappearance of these two American ships, there are on record stories of two "mystery ships" which leave even more to the imagination when it comes to explaining what actually happened to them. The records disclose the fact that the British steamer *Albyn* and the Russian bark *Yute also* disappeared during the fall of 1920 off the North Carolina coast.

The *Albyn* sailed from Norfolk in October of the same year and never was heard from again, while the *Yute,* when off Cape Hatteras, sent a radio message asking for aid. When, however, steamers reached the position given in the message, an hour later, no trace of the vessel was found and it is said she has never been heard from since. Reports to the government at the time were that the weather was perfectly calm, and investigators made the statement that one guess was about as good as another, since they did not seem to take seriously the suggestions of Bolshevik raiders or deep-sea pirates. They seemed most inclined to believe that the two cases would go down in history with the other unexplained mysteries of the sea.

Of all the unsolved mysteries of the deep, the greatest case on record is perhaps that of the American bark *Marie Celeste* which was found off the Azores three months after she left Europe in 1872 with all sails set, undamaged, in calm weather, *but with the crew missing.*

A boarding party from the ship which sighted the bark found the table set for dinner *with hot coffee in the pot* and everything aboard the ship in the same condition it would have been in had the crew left only a few minutes before. On a sewing machine was a waist which the captain's wife had been making, while toys used by the captain's son were on the floor. In the fo'castle was a table with playing cards distributed around as though members of the crew had leisurely left a game of cards.

Besides the captain, his wife and son, there were 10 men in the ship's crew. The same vessel was taken to port and again put in service, *but about six years later she disappeared completely with her crew and no word has ever come from her since.*

"As long as they build Leviathans and Mauretanias we should worry," most of us will say. And yet there is many a tale—many a mystery—which might be told outside of the printed page and off the flickering screen.

The Armours and Wall Street

THE unreliability of the news furnished the public is well illustrated in the recent "reorganization" of the big Armour packing industry. We were told of the order for sale of the million dollar country home of Ogden Armour, and of the merger of the Morris interests, and some specious reasons were assigned for the consolidation and concentration plans of the big corporation. But the real explanation of the deal was not made public, if reports from Chicago are to be credited.

According to these reports, the truth is that the refinancing of Armour & Company is in reality a surrender of control to the money lenders. Having come to a point which for the ordinary business man spells bankruptcy, it is claimed Armour visited the White House and told the President that unless permission was granted for the Armour-Morris merger, his company must submit to a receivership, for which the papers were already prepared. The only importance this information has is that it tallies with the main story.

The country is consuming less meat per capita than ever before, because meat has been made hard to get. Being hard to get, its production was less profitable. Here we have the spectacle of the business getting less, the people getting less, and the lenders of money getting more. Much as has been said about "the packers," it was the financial influence among the packers, the financial pressure upon the packers, which caused the trouble. The meat business, conducted as a meat business, might have survived: the meat business, as an appendage to a brokerage business, was doomed.

The great meat interest of the Armours is now in control of three bankers. And bankers as a class are the poorest business men on earth. From the Morgans down they have never successfully managed any business as a productive, growing, profitable service—because that is not their business.

In other words, the right of Finance to dominate Industry has never been demonstrate

Pulpit Propaganda

HOW many sermons preached from Christian pulpits are of individual inspiration, and in what proportion is propaganda disguised as divine message? Attention is called to the directed pulpit, where the minister prepares his sermon according to the programs of federations and committees on a suggested subject, and fortifies himself with argument and statistics which he has had no opportunity to prepare, and as to the accuracy of which he can give no personal assurance.

A Rabbi Agrees

"Editor Dearborn Independent,
Dearborn, Michigan.

"Dear Sir:

"After reading your editorial, 'Rosalsky Would Deport Hillaire Belloc,' in the issue of March 31, I sent you a marked editorial which I wrote in *The Jewish Times,* of San Francisco, under date of March 9. That same editorial also appeared in *The Sentinel,* of Chicago, on the same date, or the week earlier. I am the editorial writer for both papers and with you—for once—agree. Judge Rosalsky made a most unwise and regrettable mistake in speaking such unjudicial words, and you should know that his remark by no means has the backing of all Jewish people.

"Please do not imagine that one Jew speaks for all any more than William J. Bryan may be considered as spokesman for all America when he discusses Bible or that Newberry is typical of American politics. You cannot in truth indict a whole people for the acts of one.

Truly yours,
(Rabbi) Rudolph I. Coffee."

The first and last paragraphs of the editorial follow:

"Rev. Dr. Percy S. Grant criticizes the outworn creed of the Episcopal Church and is threatened with a heresy trial. Rabbi Stephen S. Wise opposes mediaeval concepts which have crept into Judaism and is called a publicity seeker. Hillaire Belloc, English author and economist, an avowed anti-Semite, is here on a lecture tour, and Judge Otto A. Rosalsky is quoted as saying he should be deported. Is there no end to post-war hysteria? Have we lost the spirit of fair play in America?. . . .

"Hillaire Belloc, because of talents as a writer and lecturer, is a dangerous opponent. Let him criticize frankly, and then we can scotch his views. He urges the Jews to develop their national traditions and customs. We decline to follow his advice, for we are done with **ghettos and ghetto life.**"

We should say that in one point this outspoken and fair-minded Rabbi is in error, namely, in describing Mr. Belloc as an "anti-Semite." Is there no more accurate designation for those who evidence an awareness of the Jewish Question? It is a Jewish, partisan and derogatory label and will not stick.

So far from being "an avowed anti-Semite," as Rabbi Coffee says, Mr. Belloc specifically denies that he is anti-Semitic at all.

Low Wages Not Cheap Labor

THERE is fear in the textile district of New England that the manufacture of woolen yarns and cloth will follow the lead of the cotton industry and establish itself in the South, eventually drawing the skilled labor from the North and wiping out both cotton and woolen industries so far as New England is concerned.

The object of investment in the South is in part to secure cheap labor and freedom from labor trouble. But there is a great difference between *low wages* and *cheap labor,* and those who expect an advantage in the South because of low wages will discover their error very soon.

There is no economy in hiring labor whose chief recommendation is that it will work for low wages.

Arbor Day, A. D. 1972

FROM its headquarters in Washington, D. C., the American Tree Association is planning a national campaign to stimulate public interest in tree planting. There is but one way to become a member of the association and that is by planting a tree. The association hopes to secure a million new members and have a million new trees planted in all parts of the country.

This proposal is of immense importance to the American people, because the forests of the United States are an essential to safety and comfort of life, as well as to agriculture and industry. Forests are necessary to the existence of our very important and indispensable bird and game population. The life of our people is dependent on the soil, which in turn depends on a continuous water supply which cannot be had unless a sufficient number of trees exist to hold the rains and gradually release the water in periods of drouth.

The American Tree Association is calling upon the people to celebrate the centennial of Arbor Day in 1972, fifty years before it happens, by planting the trees now. Stripped of all sentiment the proposition still remains an economic investment of incalculable worth as every one knows who has bought lumber recently. Lumber is vanishing, along with the forests. Our forests are being consumed four times more rapidly than they grow. The timber shortage has become one of the most critical and vital problems of today and whether you plant a tree on the lawn or on the street, that tree will be staving off a timber famine as well as preserving the natural resources of the soil. One who plants a tree serves posterity. Tree-planting instruction is sent by the association for a two-cent stamp. It is worth two cents to say that one has contributed a tree to the beauty and utility of the earth.

Federal Reserve System Cracking

WASHINGTON is worried, if reports are to be credited, by occasional conversion of influential banking houses from national to state supervision. Financial journals are discussing the matter and speculating as to the reason and whether the movement will continue until the System becomes so weak as to be inadequate for service.

The number of national bank charters issued in the last three years has been greatly in excess of the withdrawals, but the average capitalization of the latter is far in excess. Concern is felt chiefly because the supremacy of the national banks in general business, hence the supremacy of the Federal Reserve System, may be threatened. To what extent the autocracy of the latter may be responsible for the change is a matter of conjecture. Certain it is that it has been impossible to coax any great proportion of state banks into membership, and that many national banks are connected only because of the law's compulsion.

Among the more prominent banks which have surrendered their charters as national banks is the oldest bank in the country, the North America at Philadelphia, the original Federal bank organized by Robert Morris, preceding the first United States Bank, organized by Alexander Hamilton, and challenged by that statesman as irregular. It operated under charter from Pennsylvania, after the organization of the Hamilton bank, until the National Bank Act was passed in the '60's, being one of the first, if not the first, to secure a charter in that system, which it has renewed three times, and now surrenders. The Irving National of New York is another.

Coincident to the discussion of the defection, on the one side, is the inquiry as to why so few state banks are members of the Federal Reserve. Banking journals deny any connection between the two questions, yet deem both to have a common origin in the aversion of the people to the continual efforts at centralization of all forces at Washington. "It is the familiar story," says the *Chicago Banker,* "of the conflict between the powers of the Federal government and the states exercised in the supervision of like agencies."

That this idea of state sovereignty may enter into the problem is not to be doubted, but beneath that and all other apparent reasons for the recession in popularity of our present fiscal system lies the fact that the people are seeking to end the power for harm they have placed in the hands of a grasping group of Usurers.

A Farmer Speaks

The Dearborn Independent,
Dearborn, Michigan.

Gentlemen:

I am impelled to write this letter because of reading in your issue of March 17 the article "Ten Per Cent Interest," and so on, by the "Farmer's Wife." It is a true and poignant story . . . . by a woman who evidently has been through the mill. . . . describing her experiences . . . . The vast majority suffer in silence, being either too inarticulate or too indifferent to voice their grievances. Besides, they have little chance of being heard even if they make any outcry, as the press is controlled by capital and the tyranny of organized business hangs like a stifling pall over all. Then, too, farmers seem afraid to subscribe for and read the few papers or periodicals that tell the truth, being in fear of being suspected of socialistic, Bolshevistic or anarchistic tendencies, knowing that these terms are mostly kept-in-stock propaganda weapons used by organized privilege.

As to why Americans help foreign sufferers so much and ignore the suffering at home may be because long-range charity makes more noise. Besides, organized business does not want to admit there are any drawbacks or adverse conditions in their particular state, county or community, as it might "hurt business." We have the system here in Texas in all its suffering-breeding, demoralizing ugliness, the 10 per cent short-term compounded notes, organized jobbers, wholesalers and retailers, *a bank to every 1,500 or 2,000 people* (nearly as numerous as saloons once were), and a hungry horde of parasitic small money lenders who wax fat on the misfortunes of their fellowmen.

. . . . I have not much religion but what little there is would soon get spoiled by a few exchanges of a dozen apples for two dozen eggs.

Yours very truly,
(An American signature.)

Mr. Ford's Page

WHEN the people began to realize that their affairs were in a rather bad mess they conceived the idea that if only "the Government" could be empowered to take over their affairs, all would be well. Practically everybody desirous of a new era in the plain people's affairs took that view. Practically the only opponents were those whose personal and selfish interests would be disturbed thereby. Such opposition had the effect, of course, of making the others doubly sure that they were right.

As we see it now, the idea grew out of a conviction on the part of the people that things could be better, that therefore they ought to be better, and that the only agency that could really better them was the Government. Those were the good days when the people believed that all the ability and honesty and foresight and genius naturally gravitated to public office.

So the Government was intrusted with a few matters, none of which has turned out remarkably well. The real extent of the failure of Government operation has never been known because of the endless flow of tax money which healed all deficiencies and covered all mistakes. It has probably been worth all it cost, however, because the people have learned the true lesson of Government—that it consists only of men and is never any wiser than the men who comprise it. "Going down to Washington to find the Government" is a little game every citizen should play at least once in a lifetime.

IF YOU knew that the cry "take over the railroads" came from the railroads themselves, it would put another face on the agitation. The time is coming, without doubt, when the railroads must be released from the consuming burden of past financial crimes under which they are now sinking, but to lay this burden on the people's shoulders is quite another matter. The railways are not worth a penny more than what they are worth as carriers. It is not figures nor financiering that the people want, but utility values. Railways are only worth what they will do and to permit the railroad interests to unload fourth-rate properties at first-rate prices would be the worst exploitation of all.

Every little while the idea comes to life again. Sometimes dishonest public service corporations which have ramshackle systems on their hands deliberately arouse the idea in order to induce the public to take over their obsolete and thoroughly looted systems. Sometimes a city is induced to buy a broken-down public service system in the belief that it is thereby driving out a wicked corporation, when it is really giving that corporation the handsomest profit it ever made and allowing it to "get from under" without loss.

It is a pity to see ideas, capable of nobler uses, skillfully manipulated to give the plain people another blow.

There are few public service corporations that would not welcome public purchase today; it is the only thing that will save them. Unloading the loss onto the taxpayers will soon become a favorite pastime with those forms of public service which have failed to keep up with the needs of the times and have devoted themselves entirely to the production of money profits.

There is a revival of talk about taking over the railroads. In the strangest sort of places the idea is being broached that the public ought to take over the railroads. It can be heard everywhere—"public ownership of the railroads." The old tactics are being employed to make the people think that in seizing the railroads they would not only be doing away with an obnoxious form of capitalism but would also be saving the economic condition of the country from a serious slump.

Well, there is enough of fact to carry the cry along. The railroads have been so heavily loaded with dividend demands, they have been so often assaulted in the form of heavy stock gambling, that the real railroad men who have been interested only in the railroad service have had a difficult, sometimes an impossible time in giving any service at all. Everything conspires to make the public turn an expectant ear to the cry of "take over the railroads!"

What would the public think if they knew that this cry is heard in the railroad offices also?

What would the people say if they knew that there are railroads which are just waiting, eagerly waiting to be "seized by the public"?

That is something the people need to keep well to the fore of their minds, for if the movement to take over the railroads becomes strong enough, as conceivably it may under the skillful direction of the railroad publicity managers, then the people will need all their alertness and all their business sense to keep from being most unmercifully cheated.

For here is the point: there will be no "seizing of the railroads"; there will not even be a "taking over of the railroads" as the average person conceives it; there will simply be an unloading of the railroads onto the people.

It would be an "unloading" because the transfer would occur at prices which would not represent the present values of the railroads at all.

Ask the residents of the Northwest and they will tell you what it means. They will tell you that the railroads asked permission of the government to adjust freight and passenger rates according to a certain plan of railway valuation. Permission was given and the values were fixed. And the values included all the "water," all the burdens of past and forgotten exploitation and speculation, all the worn-out and discarded equipment—that is to say, the "value" was reached by every trick that is known in the business of profiteering. And then the rates which the people paid were adjusted to that valuation. Of course, freight and passenger rates took a great boost. But it was the same old inefficient railway system and the same old insufficient service.

Now, if the purchase of the railroads could lift them from under the consuming burden of past financial crimes, that would be one thing. The time is certainly coming when the burden of these crimes must be lifted off our transportation system. But whether they are to be lifted off the railroads only to be placed on the shoulders of the people is a question that admits of no doubtful answer.

If the values of the railroads, when offered to the public, are to include all the mistakes of the past as well as all the expected profits of the future, if they are to include "dead horses" of speculative debts charged up as stock which has no physical value equivalent, if they are to be based on the assumption that these railroads are first class railroads when they are only third or fourth class railroads, then the public would be most mistaken if it should buy.

For the present, the main thing for the people to do is to remember that there are more railways for sale in the United States at the present writing than there ever have been in all the periods of railroad history taken together. Anybody can buy a railroad. They are a drug on the market. And any attempt to make the people believe that they are opposing the wishes of the railroad interests in urging public purchase is a deception.

We can afford to remain quiet on this issue until we see the course of the times. The old form of railroading, like the old form of farming, is on the way out. The old form has paid its owners and exploiters well for many decades. The amount of wealth taken out of the people by railways exploitation is beyond telling. The people owe the railroads nothing. The railroads as property would be worth no more to the people than any other kind of run-down property. The crowning imposition of old-time railroad financiering on the American public would be to unload the roads at present railway valuation.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

His Son Was Probably Murdered—Pershing

But the War Department Can't Take Cognizance of the Cronkhite Affair

By CHARLES ALBERT COLLMAN

THE records of centuries have shown that republics are singularly subject to the attempts of powerful groups in demanding and assuming special prerogatives. The experience of this country in the last few years has proved this attempted assumption of power by a skillfully organized foreign race, whose millions have been poured upon our shores in comparatively recent times. Its leaders, through their persistent efforts aimed against the established forms of government, have successfully obtained a temporary demoralization of the Department of Justice and the War Department, and even the American jury system and the Federal courts have been made to feel their hostile influence.

The entire country by this time knows the focal point upon which this movement has been centered—the killing of young Major Alexander Pennington Cronkhite at Camp Lewis, Washington, the confession of one man to having shot the officer, and his implication of another in the crime. The country has been informed of the mystery in which the young officer's death was deliberately involved in efforts to protect one of the men indicted; of the evidence which has been destroyed; of important records that have vanished; of witnesses tampered with and intimidated; of the falsely directed and insidious propaganda circulated on behalf of one of the accused; of the obstacles placed in the way of the slain man's father in investigating the cause of his son's death; of the campaign of defamation launched against Major General Adelbert Cronkhite and his family, and of the influences which have resulted in the sudden retirement from the army of this honored American commander.

General Cronkhite was in command of the coast defenses of Panama and the Panama Canal Department in August, 1917, when he was called upon to organize the 80th Division of the National Army. Of this division, the majority of the officers were from New Jersey, Maryland and West Virginia, while the enlisted men came from Western Pennsylvania, Virginia and West Virginia. It was named the "Blue Ridge Division," the shoulder insignia being a khaki shield outlined in white, with three blue mountains superimposed, representing Pennsylvania, Virginia and West Virginia, through which the Blue Ridge Mountains run. The 80th was the only division in the American Expeditionary Forces which was called three times into the Meuse-Argonne offensive, and participated in all the operations of the First American Army from September to November, 1918.

80th Only Moved Forward

THE slogan of the Blue Ridgers was: "The 80th Division only moves forward." An extract from General Order No. 19, issued November 11, 1918, reads:

> It is necessarily a great honor to be allowed to command an organization which earns such commendation.
>
> It is likewise a great honor to belong to such an organization.
>
> I do not know what the future has in store for us. If it be war, we must and shall sustain our honor and our reputation by giving our best to complete the salvation of our country.
>
> If it be peace, we must and shall maintain our reputation and the honor of our division and the army, as soldiers of the greatest country on earth, and as right-minded, self-respecting men.
>
> The 80th Division only moves FORWARD.
>
> A. Cronkhite,
> Major General.

When General Cronkhite was awarded the Distinguished Service Medal by the American forces, the War Department order read:

"For exceptionally meritorious and distinguished services. He commanded the 80th Division during the Argonne-Meuse offensive, where he demonstrated great ability as a leader and proved himself a commander of initiative and courage."

The general was also made commander of the Legion of Honor and awarded the Croix-de-Guerre with Palm by the French forces, and was made K. C. M. G. by the British forces.

On October 26, 1918, General Cronkhite had his headquarters in the Argonne Forest at a little place called Le Nefour. That day he received a cablegram from General Peyton C. March, stating that his son, Major Alexander Pennington Cronkhite, had been shot and killed at Camp Lewis, Washington. The 80th Division was then preparing to enter the line for the third time, and its operations began early on the morning of November 1. It made an attack in the St. Georges-St. Juvin sector, in conjunction with the 2nd Division (5th Corps) on the right, and the 77th Division (1st Corps) on the left, advancing in six days to a depth of 24 kilometers, to the Yoncq-Beaumont line, and capturing the town of Buzancy, the key-point of the German position. The casualties were 44 officers and 1,015 men and the prisoners taken numbered 38 officers and 793 men. Among the material captured were 55 guns, 22 mine-throwers, 507 machine guns, besides aircraft rifles, large amounts of ammunition, and many armored automobiles, motor ambulances and the like.

The Blue Ridge Division stayed in line until November 6, when it was relieved by the First Division, which had a mighty hard time in passing through the 80th, since the latter was going forward so fast that it was found difficult to overtake it. The general remained with his division until November 18, when, in recognition of his efficient services as a division commander during the campaigns of Picardy, St. Mihiel and the Meuse-Argonne, he was assigned to the command of the 6th Corps in the Army of Occupation, with headquarters at Villerupt, France. Later, at his own request, he was transferred back to the 80th Division to accompany it to the United States.

Until General Cronkhite's return to this country, practically no official information had been made available to him with respect to the circumstances attending the death of his son. What was known of those circumstances was peculiar. Apparently an officer highly skilled in the use of firearms had accidentally killed himself with a pistol while engaged in the performance of duties which on their face seemed to preclude the proper use of firearms.

Almost co-incidentally with the death of young Major Cronkhite, *a canard had appeared in the press of the United States that General Cronkhite had been convicted of treason in France.* The name Cronkhite, though of purely Dutch origin, lent itself admirably to such unscrupulous propaganda. The report was immediately denied, it being pointed out that General Cronkhite was the son of a distinguished officer of the United States Army, and that his immigrant ancestor was of Dutch and not of German origin. The army was not to be robbed of the services of General Cronkhite by any such foul means.

Soon, however, it began to be rumored that young Major Cronkhite had committed suicide. It was whispered that he had taken his life in the belief that his father had been convicted of treason, the evidence being conclusive, however, that no such belief could have existed on his part. *It was also whispered that he feared to go to France.* Such rumors were discreditable not only to the deceased, but to his honored father as well.

Under the circumstances it cannot be thought unnatural that General Cronkhite should have set about to determine the facts. For him to have done less would have been unnatural on his part as the father of one alleged to have committed suicide for reasons touching upon the honor of his family.

It often requires greater courage to stand up under certain forms of attack, than it does to face machine guns and poison gas. For more than two years the general was compelled to remain silent, while in certain types of periodicals and newspapers, aspersions were cast upon the memory of his son, his wife was attacked and his own loyalty impugned. He kept silent, as an honest soldier would, *depending upon the War Department and the Department of Justice to defend his honor and uncover the mystery that centered about the death of his son.*

Without making any charges or insinuations whatever, the aggrieved father set about the task confronting him, alone, unaided in his effort to find the truth. Indeed, at the outset he had no reason whatever to suspect that anyone in the War Department itself had been guilty either of misfeasance or nonfeasance. *That there was gross culpability on the part of the military authorities was soon to appear.*

The War Department Files

ON FILE in the War Department there was an official record of a finding that the death of Major Cronkhite was accidental and self-inflicted. Yet, of the circumstances of his death there was no report whatever, though Army Regulations required that there be such a report. So, too, it was learned that a board of officers had been appointed to investigate the case and had, in fact, investigated it, yet there was no report by that board. And it soon appeared that not only had official records been suppressed, but that vital evidence in the case, which had once been in possession of the military authorities, had been destroyed or at least removed. Surely these were facts which justified the suspicions of the father and his determination to bring the truth to light. That a major of engineers could lose his life while on duty with troops and that the bare requisites of the Army Regulations with respect to the investigation of his death should not have been complied with was unthinkable. So, also, that official records should be permitted to be suppressed.

Next, the body of the deceased was exhumed, an expert examination thereof showing conclusively that the wounds from which the death of Major Cronkhite had resulted *could not have been self-inflicted.* Not only had the clothing of the deceased been removed and destroyed *contrary to custom,* but the bullet alleged to have killed him had been extracted from the body.

No sooner did it become known that through the investigations of General Cronkhite, serious disclosures were impending regarding the circumstances of his son's death, than hostile influences made themselves evident in the Department of Justice and the War Department. Innumerable obstructions were placed in his way, and insistent demands were made upon him to leave the country and go on foreign service. The alternative presented to him was his retirement. He was then not yet 62 years old, and fit and qualified in every way for further service. In the ordinary course of events, the legal age for retirement is 64 years.

The obstacles which the general encountered in the course of his official duties can only be dealt with in another article. But in the circumstances he adopted the only course which was open to an officer of his character. He declined to make application for his retirement. He had become involved in an undertaking which with that resolution peculiar to him he was determined to carry through to its logical conclusion. Aspersions had been cast upon his credit as an officer as well as upon the name of his son. Not only were their names being scandalized and brought into disrepute in the press, and their credit being questioned by an uninformed public, but General Cronkhite himself, as will be shown, had been impugned officially by the Secretary of War.

It became apparent that hidden influences were working to destroy the general. He knew that he must carry on not merely to accomplish the task to which he had set his hand, which was to prove to the world that an officer of the army could not be murdered with impunity, but to justify the faith which the President of the United States had but lately reposed in him. This he could not well do in the face of the increasing difficulties which were besetting his path, should he retire from active service under charges which remained undenied upon his record. To do so would but strengthen the hands of those who were bent upon discrediting him. As a man of courage, he did not propose to be deterred in his course even though it were apparent that the eventual proof of the guilt of those charged with the murder of Major Cronkhite would necessarily reflect upon the War Department by reason of irregularities on its part which the disclosure of the truth would bring to light.

In the face of the general's refusal, he was retired from active service in the army on February 1. *He requested a court of inquiry. This was refused. His friends, thereupon, brought an appeal on his behalf before Congress.*

Several days after the public announcement was made that General Cronkhite had been retired, I called to see the General of the Armies, at his office in the War Department Building, Washington. General John J. Pershing today seems a trifle more advanced in years than the popular portrait, that has made his likeness so familiar to the country, would indicate. But he is erect and supple as a stripling, and few can meet him without being impressed quite vividly by the presence of a man sincere, open-minded and straightforward.

In General Pershing's Office

I INFORMED the General that there was no desire to criticize any action taken for the good of the service, but that it was quite generally regarded as unfortunate that General Cronkhite had been selected for retirement just at this time, when he was being made the victim of a country-wide campaign of villification such as few American Army officers had ever been called upon to endure. "In magazines and newspapers owned and published by a certain race," I told him, "the story is being spread that the general's son, the late Major Cronkhite, committed suicide because he had been ordered abroad for active service during the war. That on his tombstone in Arlington Cemetery are chiseled the letters, 'S. I. W.'—self-inflicted wound, and that this inscription bears an ignominious meaning in army circles. And that his father, in the desire to efface this inscription from his son's tombstone, is seeking the prosecution of two men for his son's murder. It is, of course, not necessary for me to state to you that such letters are never chiseled on the gravestone of an army officer, and that the late Major Cronkhite's last resting place is not Arlington, but the West Point Cemetery. It is not known whether the War Department had taken these facts into consideration before retiring the general, or whether it was at all aware of the nature and significance of these cruel attacks."

After having listened to me without a word of interruption, General Pershing replied: "You know that two years ago, General Cronkhite was assigned to duty in the Canal Zone. He requested postponement of these orders, due to leaves of absence, authorized delays, and his attachment for duty with the Department of Justice. Owing to the circumstances, of which we were well aware, the department did all that it could on his behalf. **His son was killed, maybe murdered, probably was,** and he has the deepest sympathy of everyone. But this matter has dragged along for two whole years, and the Department cannot afford to consider the personal affairs of its officers."

"But," I suggested, "this delay in prosecuting the two men indicted for the murder of Major Cronkhite can scarcely be laid to the fault of General Cronkhite. That is none of his doing. Prominent members of the American Jewish Committee, of which Louis Marshall is the head, are responsible for the obstructions placed in the path of the prosecution, in opposing the extradition of one of these men to Tacoma. And I am sorry to have to point to the fact that Mr. Albert D. Lasker, chairman of the United States Shipping Board, and Eugene Meyer, Jr., managing director of the War Finance Corporation, are members of the executive committee of this organization. It must be remembered that the heads of the American Jewish Committee caused a similar delay of two years in the case of Leo M. Frank, whose cause they took up for special agitation, as they have done in the case of Rosenbluth."

"What was that case?" asked General Pershing.

"That of a man who was convicted of the murder of a 12-year-old girl in Atlanta, Georgia, in 1913."

"Oh, yes, I remember it now," he responded, after a moment's thought. "However, as I said, the Department cannot take cognizance of personal affairs. During those two years, the general was given certain duties, such as attending board meetings and the like. He was merely nominally on military service."

"Was he engaged on no serious work during this period?"

(Concluded on page 8)

Debts and Slave Girls Cause Tong Wars

Chinese in America Partially Governed From Peking, Investigator Finds

By HELEN PUTNAM VAN SICKLEN

This is the second of two articles on Chinese tong warfare in the United States.

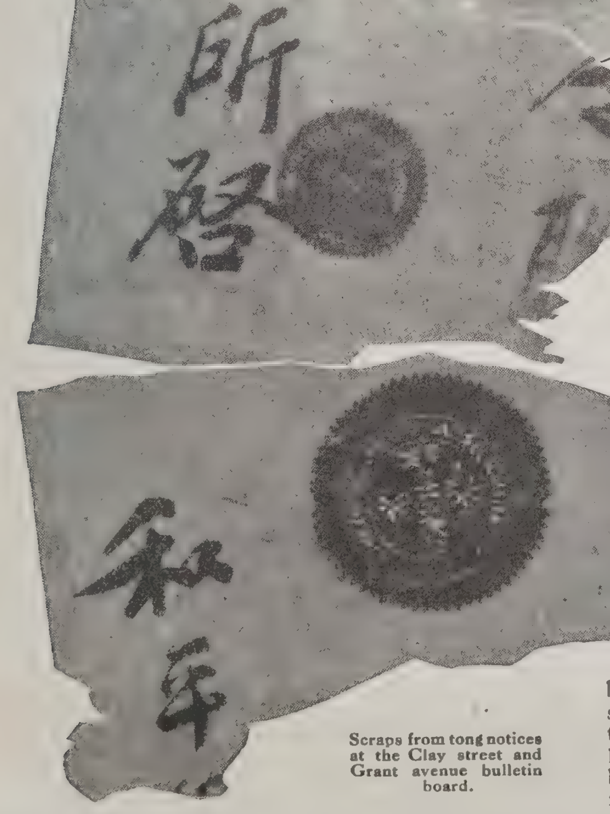
Bulletin board at Clay street and Grant avenue, San Francisco.

Above — On Grant avenue in Chinatown. At left—Joss, or altar, in the Bing Kong Tong.

WHAT causes tong wars? Unpaid gambling debts and stolen slave girls are the two chief causes. "It's a sore subject," said Consul General Ko-liang Yih, at San Francisco, "and I dislike that it should have publicity. We hope to stop tong troubles, but my people are a sentimental, not a practical people. Real or fancied injuries they resent to the very end. So it is that often a man cheated out of a hundred dollars will spend thousands to even the score. You Americans cannot understand their ways, but if you would let the Chinese Government rule its subjects living in this country, you would not have this problem to contend with. I know tong troubles would cease."

As a matter of fact, the Chinese in America are partially governed from Peking. Practically all come from one of the six great families of the Quangtong Province in China. Hence in San Francisco has grown the Six Companies, an organization to which all the Chinese in America belong, to which most of them pay a dollar or so a year, and which in turn watches over their interests, provides hospitals, schools to teach their language and ideals, a special police system, and so on. Its real name is The Chinese Consolidated Benevolent Society. It is an American corporation and is financed largely by western American-Chinese. It is recognized by the consul general who is a party to all contracts, such as the appointment of its American attorney, John L. McNab, for instance. Its constituent elements are interesting. Really it is composed of seven great families within six groups. Each group elects a president and a secretary who hold office for a four-month term. So three successive families are in office each year. Thus in two years there has been a complete cycle of all the families. Over all presides a grand president who comes from China, forming the connecting link with the republic. He is always a Mandarin and seldom able to speak the Cantonese dialect of the Chinese here.

Tracing the latest war from its origin to its end is interesting. In March, 1922, at Reno, Nevada, a member of the Bing Kongs was killed by a member of the Hip Sings for cheating in a game of pi gow. Immediately, the chiefs of those two tongs met at the Peace Society in San Francisco, to discuss what reparations the Hip Sings should make to the Bing Kongs. For life is frankly measured in dollars by these people, and the family or tong of a murdered man will always dry their tears and forgive if the "settlement" is adequate. Otherwise—war.



Scraps from tong notices at the Clay street and Grant avenue bulletin board.

Of late years, the Peace Society which is composed, according to the consul general, of representatives from each tong, has taken a hand in all such conferences and is said to have nipped many a war in the bud. Nevertheless there were three distinct wars during 1921, three in 1922. Certain it is that both the Peace Society and the Six Companies have, on one occasion at least, joined with the San Francisco Chinese Chamber of Commerce to raise the indemnity sum of $55,000 demanded by the Suey Sings of the Hop Sings, and so brought to an end, after many months, a war originating over the theft of a slave girl.

But this time no solution offered by the Peace Society was accepted, and the Bing Kongs formally declared war against the Hip Sings. Every Hip Sing and Bing Kong in San Francisco disappeared from sight. Within a week five men had been killed—one in Seattle; one in Butte, Montana; one in Salem, Oregon; one in Minneapolis; and one in Watsonville, California. Not one victim had had anything whatsoever to do with the two gamblers whose quarrel in Reno started the trouble. A life for a life is the rule—it matters not who pays so the enemy tong loses a man. From the Chicago chapter of the Hip Sings alone came thousands of dollars and 30 gunmen to help in the West. In July the forty-sixth victim fell in Chicago and soon after another "lasting and final peace" was signed in San Francisco.

Tong wars end as suddenly as they begin and no hard feelings exist between the two camps when the trouble is settled and the cash payments made. Some of the highest prices ever put on men's heads were offered during this war. Every individual Hip Sing's life was worth $100 to Bing Kong assassins, while the officials' heads were valued at $8,000 apiece.

Tong feuds grew purely from western world conditions, when in 1860, in the early days of the Chinese colony in California, the most popular trade was that in oriental women slaves. The Hip Ye Tong, the first to organize, seems to have been an offshoot of the Triad Society, a political organization of the Tai Ping rebellion. Here it lost its political motive, and was originally formed to protect women from slavery, but soon degenerated into a society which protected the slave dealers from interference. They offered bribes to customs and police officials; exercised corrupt political powers; frightened those whom they couldn't bribe; and finally employed a band of thugs to do the rest. So, while the missionaries and the police rescued slaves, the Chinese Christians suspected of aiding them got into severe difficulties with the Hip Ye Tong, plunging the oriental quarter into turmoil. Gradually the patient, respectable Chinese organized—those of the same name; fellow townsmen from the Quantong province, compatriots in special trades. So family, district and social tongs were formed, each protective in spirit, until all the elements of Chinese life, both good and bad, were entrenched.

The first real tong war occurred in the '80's when the See Yups, or laboring class, opened shops in competition with the Sam Yups, who for generations had been the merchant class in China. The latter fought at first by leasing all the available stores, and by spreading bad reports of the See Yup credit. Finally, close to bankruptcy, they challenged the See Yups to open conflict on the street. Many such battles followed, much noise and smoke but only rarely a casualty. Captain Lees, a famous police chief of that time, winked at these conflicts, saying they served as a safety valve to dissipate the underlying savagery which the Chinese inherit from the Tartars. A later chief, attempting to "clean up," stationed spies in Chinatown, and made daring raids, so teaching greater caution. The gamblers and slavers added sheet-metal doors, secret scouts, signals and underground avenues for escape. Killings became bold, brutal and frequent.

The longest and most spectacular of all tong wars began in 1901, caused by a quarrel of a Hop Sing and a Bing Kong over the price of an unpaid-for slave girl. It lasted more than seven years with peaceful respites and hope of settlement each Chinese New Year. Always some trivial incident started them off again. Then the earthquake and fire in 1906 wiped out the Chinese quarter. A peaceful year followed till the Hop Sing chief was slain by Lee Foon, a member of his own family tong! In their code it is a fiendish crime for one Lee to kill another Lee. Unknown to either the Hop Sings or the Bing Kongs, the Lee family now joined their little private war, thus accounting for Lee Foon's sudden end. Then to cap the climax a venerable old member of the Chinese Free Masons, mistaken for an enemy, was shot. Through the influence of his fraternity, now involved, peace was brought about. The Six Companies called the tong leaders to a conference and demanded an end to the feud. The chief of police announced he would place guards to bar all tourists out of Chinatown, and bring grand jury charges against their leaders. The consul general published a proclamation from the Empress Dowager in Peking, threatening to imprison their relatives in China if the tong warriors did not declare peace. So the treaty was signed:

"Whereas the Hop Sing Tong and the Bing Kong Tong have had for some time differences among themselves, they now agree to listen to the advice of the community. And, before the consul general, the chief of police, the vice-consul, and the presidents of the Six Companies, at a meeting held on this day, January 28, 1908, at the Six Companies, the representatives of these two tongs and also the representatives of other tongs agree that hereafter the Bing Kong and Hop Sing tongs will cease their fighting and will forever keep the peace with one another.

"Resolved, that if they should again start a fight, thus violating this agreement, they consent that the men of the other tongs may give their names and point out the fighting men to the consul general who will notify the chief of police to arrest Bing Kong and Hop Sing men and have them severely punished in accordance with the law.

"A copy of this agreement is to be sent to the Chinese legation as a record. It is understood that this declaration of peace is for all tongs."

Then just three years later Yee Chow, of the Yees, launderers by tradition and heritage, and a large and wealthy family, eloped with Bo Gue, a slave of a member of the On Yicks. Rescued, after a court fight, by the Presbyterian Mission, Bo Gue was held in the mission while the Yees and the On Yicks battled over the $1,300 payment demanded of Yee Chow by the On Yicks. Again tourists were barred from Chinatown. Merchants, guides and restaurants suffered heavily, till at last, in ill favor everywhere, the Yees "settled up" and ended the quarrel, while the fickle Bo Gue married another youth who professed Christianity.

There was peace on the Pacific Coast in 1912 but the Hip Sings fought the On Leongs, the Order of Civic Peace, in New York and Boston. It was a short scrap for local public opinion was so aroused after a bad fire in New York, started in revenge, that the tongs were frightened into peace settlements.

In 1915 the Hip Sings and the Hop Sings were hard at it once more, this time over a debt. A couple of accidental shootings on the part of Hop Sings caused the Sen Suey Yings and the Suey Sings to join the fray allied with the Hip Sings. Much outclassed, the Hop Sings suddenly switched the fighting to the country districts where men who hardly knew there was a war

When in Doubt Always Say "No!"—Kohler

A Little Business Injected into Politics by a Politician

By NORMAN BEASLEY

THE city of Cleveland lived within its income in 1922 for the first time in its history—it lived within that income because its mayor always, when in doubt on the proposition before him, said "No!"—and meant it.

That mayor was, and still is, Fred Kohler.

Not only did Cleveland live within its income in 1922 but it closed the books on the year with a surplus of $558,904.92; this in spite of the fact that its actual cash income was approximately $500,000 less than in 1921.

In addition the Kohler administration began the year with nearly $800,000 in debts left over from previous administrations, of which $145,000 was represented in the December, 1921, pay roll shortage. The problem in Cleveland was met by substituting business for politics.

Says Kohler:

"When in doubt politics always says 'yes' while business always says 'no.' The answer was simple. We eliminated politics and 'pull.' It always had been my observation that thousands and thousands of dollars of the taxpayers' money was wasted each year through pure shiftlessness and deliberate inefficiency on the part of city employes. That was due to politics.

"A good place to start cleaning out things was on the jobs that were held through political, or vote-getting, influences. We began to trim the pay roll. We began with the loafers and they were eliminated. As we became better acquainted we were able to pick out the unnecessary, shiftless and inefficient. They went next. The net result was that we saved $1,389,264 in the city's pay roll, alone. The total amount of work has been increased but no municipal activity has suffered. On the contrary, the important activities have been bettered and more has been accomplished—all at a tremendous saving to the taxpayers.

Car Fare Cut a Cent

"DURING the past year we decreased the street car fare from six to five cents. Starting the year there was a deficit of $89,000 in the street car company's interest fund; this fund was increased to a point where the fare reduction was made possible and the interest fund closed the year with a balance of more than $400,000.

"Also, during the year, we faced a proposition of whether the garbage disposal division of the city's activities was to be run for the benefit of the workmen of the division or for the benefit of the public of Cleveland generally. It was decided—after a battle—in favor of the public. It might be of interest to remark that the cost per ton collection of garbage in 1921 was $5.95 while in 1922 it was $4.78, a saving of $1.17 a ton, or about $80,000, and with no reduction in wages.

"During 1922 the city repaved 24 miles of streets at an approximate cost of $1,830,000 and, at the same time, 14 miles of sewer was put in. More street repair work was done in 1922 than in any previous year and at a saving of from 30 to 50 per cent, that saving being effected in materials and pay roll. The municipal light plant increased its earnings, exclusive of taxes, from $27,000 in 1921 to $200,000 during 1922. During the year we purchased in excess of $190,000 worth of equipment for various departments and, at the same time, the water division of the utilities department spent more than $400,000 out of its earnings for pipe lines, extensions, fire hydrants, and so on, while the light division of the same department spent in excess of $500,000 out of its earnings for cable connections, underground work and other equipment.

"These are just a few of the outstanding accomplishments and I name them to show what can be done when a city administration substitutes business methods for politics.

"But, lopping 1,500 heads off the city pay roll made a lot of enemies—naturally."

Kohler smiled.

Kohler's story—that is, his personal story—is pretty well known. Ten years ago Theodore Roosevelt called him "the best police chief in the United States." That was a personal viewpoint, of course; but Kohler had surely made a name for himself. He had made a lot of enemies, too; his enemies "got" him. Three times he was charged with conduct unbecoming an officer; the third time he was dismissed.

Having been a force in the life of Cleveland his dismissal caused much comment. He accepted it—and started his fight back. He ran for the office of county commissioner and was defeated, although he ran 19,000 votes ahead of his ticket. Two years later he ran for the same office once more—and was again defeated although he led all candidates on his own ticket. Not discouraged he repeated for the office in another two years—this time he was elected by a big majority.

In 1920 he announced that he would run for mayor. He was laughed at, sneered at—derided. He made a house-to-house campaign, doing this months before the elections, and winning when the votes were counted. Winning in spite of the opposition of every city newspaper, many of the city's clergy and as vicious a campaign as could be staged against one man.

He made no pre-election promises, being content to tell the people to whom he talked that he would, if elected, inaugurate a business administration.

What Kohler did in his first year in office has been told.

This "mayor who came back," for that is what they call him in Cleveland, has definite opinions on how a city, or a county, or a state, or a nation, should be managed by those directly responsible.

"I do not believe it possible for a business man to be a successful administrator of civic affairs," he says. "This may sound conflicting with the idea of running a 'business administration.' It isn't. It simmers down to this:

"A man to be a successful city administrator must have had experience in city management, or management of municipal funds. A city, or a state, presumes that the man in office is a crook. It presumes that before it elects him. Presuming he is a crook it surrounds him with safeguarding fences to keep him from being crooked.

"For illustration:

"If I want to buy something for the city, or sell something, I am forced to advertise for bids. I am forced to wait 30 days before I can act. A business man, with a business man's training, can go out in the open market and make an immediate purchase. The restrictions that surround a municipal official are irksome to a business man who is accustomed to getting what he wants—immediately when he wants it.

"Another thing, a man to run a city must have a peculiar training. I could not successfully manage the affairs of the largest bank in Cleveland, or the largest manufacturing institution; at the same time the heads of these institutions could not successfully manage a city. It requires years of study and experience properly to manage city affairs. A municipal business is so entirely different from a general business that it requires a peculiar experience successfully to run either.

Cleans House Early

"A SUCCESSFUL city administrator must know the 'ins and outs' of politics. He must be able to recognize, immediately, the political panhandler—and treat him accordingly. There is this similarity between managing a city and managing a business—each should be handled on a strictly business basis. That is the result, of course, but the details are vastly different and a man has to understand the details to gain the desired result.

"Politics, when in doubt, always says 'yes'; business always says 'no.' This is my system. It is easy to change your decision and make it 'yes' when you have said 'no'; it isn't wise first to say 'yes' and then be forced to gig back into 'no.'

"Another thing a man trained in business has to contend with when he gets into public service is the inefficiency of employes. Many of them are there because of vote-getting ability. They stick. The business man, in his office, would not permit such inefficiency but when he gets into public office he finds himself surrounded by pap-seekers and, unless he knows all the angles and twists to the game he is likely to become hopelessly enmeshed. He can only know things through experience in dealing with them."

Kohler, immediately on entering office, began to clean out. He appointed various commissioners, selecting them for their ability and not on any friendship basis. He says, frankly, that there are several appointees of his that did not vote for him—and might not cast their votes in his favor in another election. That does not interest him. The only thing he is interested in is the ability of these lieutenants to work—and do things for the city of Cleveland.

Comfortable Surplus Now

HE SELECTED men for various posts who had experience in handling problems that would come before them. "The mayor of a big city," he says, "is guardian for the citizens. In Cleveland there are 57 different languages being spoken daily. These people don't understand the ramifications of city government. They have a 'boss' in the man they work for; they don't want a 'boss' in city affairs. They want a guardian—a man who will stand in the way of infringements on their rights as citizens. A mayor should always stand in the way of unnecessary expense to the taxpayers."

An illustration of how Kohler saved money is found in his report on the street railway. It reads:

"On January 1, 1922, this administration went into office with a deficit of $89,000 in the interest fund of the Cleveland street railway company, the barometer by which Cleveland street car fare is regulated. The street car fare was six cents cash, nine tickets for 50 cents, with one cent for transfer and no rebate. The maintenance fund showed a deficit of $425,000 and in November of 1921 the maintenance allowance had been increased to 12 cents a car mile, the highest it had ever been.

"The past year has changed the deficit of a year ago in the maintenance fund into a surplus of $800 000, of which $500,000 has been saved out of the maintenance allowance. The interest fund has been changed from the deficit of $89,000 to a surplus of approximately $440,000. The rate of fare has been decreased from six cents to five cents, with one cent charge for a transfer.

His Son Was Probably Murdered—Pershing

Concluded from page 6

"No. He was supposed to be on active duty, but his tasks were perfunctory. We have the highest regard for General Cronkhite, and we are proud of his record —it is really a splendid one. I, personally, am grateful to him for his excellent achievements, and I am gratified to state publicly that I wish to thank him for what he has done. We have had several conversations on this subject, but I told him that we could not extend the time further for him to devote to his personal affairs. He has received longer consideration than any officer in the service. Besides, quite a number of officers of high rank have been retired as he was."

"Before they reached the age of 64 years without physical disability?" I asked. "I believe that is the legal age for retirement."

"Yes," he replied, "some of them were retired at 62 at their own request, and even when no application has been made, they can be retired on the President's order at 62. The general seems to feel, I know, that some antagonism existed against him in the Department. But that is not the case. We all think most highly of him."

"But don't you think it is regrettable that he was dropped from active service at this time? It gives his enemies a chance to gloat over him—the action taken is to their satisfaction."

"Oh, I don't see that they can get any satisfaction out of his retirement," said General Pershing. "I can only state positively that there was no sentiment of antagonism toward him in the Department. Furthermore, I give you my word that such was not the fact."

The General gripped my hand, as he concluded, and his voice bore the note of conviction. I feel assured that he meant every word he said.

It is too much to expect that a man, occupying the important post of General of the Armies, should necessarily be cognizant of the slanders circulated against a United States Army officer, or that he should be aware of secret acts of wrongdoing committed in so extensive a department of the government. No doubt General Pershing acted in the utmost good faith, though his viewpoint appears to have been utterly different from that of the President and General Cronkhite. Apparently he has given but little consideration to the undaunted purpose of General Cronkhite to relieve the army of the reproach which had been put upon it through the undetected and concealed killing of an officer of the army while in the discharge of his duties, and less sympathy to the personal motive of the general to do justice to the name and honor of his son.

Differences of opinion prevail as to the facts, and these will be taken up in due course. It is maintained, however, that at no time, from the date of General Cronkhite's return to the United States in May, 1919, except during the period of a leave to which he was entitled under the regulations of the army, was he performing other than military service, nor that he was at any time unavailable for military duty, which should appear from the fact that he had been performing duty of an important and strictly military character. Friends of the general maintain that there has been a fixed purpose to penalize him through enforced premature retirement for doing that which he had been required to do by the President and the Department of Justice.

The above-mentioned canard, concerning the alleged inscription on the tombstone of young Major Cronkhite, was published conspicuously on October 27, 1922, in the Jewish *Tribune*, the "Forum of American Jewry," copies of which periodical are abundantly exhibited for sale on the public news stands in New York City. In the Jewish Year Book, which is prepared in the offices of the American Jewish Committee (see report for 1921-1922, page 356), under the list of "Prominent Jews in the United States," the editor of the Jewish *Tribune* is noticed as follows:

"Nehemiah Mosessohn, editor, b. Russia, 1853. R. New York City." (Jewish Year Book, Vol. 24, 1922-1923, p. 184.)

Young Major Cronkhite lies buried in the Cemetery of the United States Military Academy at West Point, right near the tomb of General Grant, and beside the grave of his grandfather, Major General Alexander C. M. Pennington. The men of the 213th Engineers sent a carload of flowers and an American flag to the burial. On the tombstone of this officer, below a chiseled "Crusader's Cross," is the inscription:

Alexander Pennington Cronkhite
Corps of Engineers, United
States Army, September
29, 1893. October 25,
1918.
Class of 1915.
"Well Done—Be Thou at Peace"

The above inscription is taken from the West Point "Alma Mater," the last verse of which runs:

"And when our work is done,
Our course on earth is run,
May it be said, 'Well done,
be thou at peace.'
E'er may that line of gray,
Increase from day to day;
Live, serve and die, we pray,
West Point, for thee!"

The 97th Article of War provides that a court of inquiry to examine into the nature of any transaction of, or accusation or imputation against an officer, may be ordered by the President or by any commanding officer upon the request of the officer whose conduct is to be inquired into. (Manual for Courts-Martial, United States Army, 1917, pp. 287-288.)

While neither the President nor a commanding officer is obliged to order a court of inquiry on the demand of an officer who desires to vindicate his character, nevertheless, where the facts are not thoroughly understood by the authority who is requested to order a court of inquiry or cannot be fully ascertained by an investigating officer, in the event of a refusal, the officer who requested the court, if not satisfied, may appeal to higher authority.—(Winthrop, p. 805.)

In this case a court of inquiry was not ordered at the request of General Cronkhite. The higher authority to which he now appeals is Congress.

A City Named on the Toss of a Coin

The Melting Pot of Old Age and the Center of Winter Dodging

By GEORGE H. DACY

THREE decades ago, a citizen of Detroit and a Russian nobleman on a fishing trip along the western coast of Florida decided a most extraordinary dispute by the flip of a coin. It so happened that these two gentlemen jointly owned the land which today is the site of the city of St. Petersburg, known popularly from coast to coast as the sunshine city of the South. These capitalists agreed in their selection of a location for the city which they proposed to build and develop. They could not agree, however, on the name. Finally, the American who wished to call the city Detroit, Florida, suggested to his companion who wanted to christen the embryonic municipality St. Petersburg, after his beloved Russian birthplace, that they toss a coin to decide the controversy. The nobleman acquiesced. A dime was flipped into the air and when it fell to the deck of the boat the head of the coin was exposed. The Russian had won and St. Petersburg became the name of the resort which during the winter season of 1922-1923 entertained approximately 90,000 visitors.

One can travel thousands of miles and never find a duplicate of St. Petersburg. It is a city quaint, curious and inimitable. It outgrew its swaddling clothes before they were completed. From the few thousands that initially were recorded in the lists of its city directory it has expanded until, after a score of years of active development, its permanent and transient population during the topsy-turvied winter season almost tops the 80,000 mark. It is a melting pot of old age, for there is no place that becomes the temporary residence of as many persons who have passed the half-century mark as does St. Petersburg. It is the winter playground capital of all Southland.

The seats at the famous round-table discussions of King Arthur and his knights were not nearly so interesting, we believe, as the green benches of St. Petersburg that border the curbs of the downtown sections and which are occupied by thousands of visitors from every part of the globe who converse on every subject within the ken of man. Here one may find a prominent New England banker and a horny-handed corn producer from Iowa. A cattleman may here get his first chance to tell his side of the story to a Chicago packer. The New York consumer of costly fruits and vegetables meets with the Florida grower.

In the heart of the city is William's Park. The park is only one block square yet it entertains daily 15,000 to 20,000 tourists. A large band shell where an excellent military band gives two concerts daily during the winter is a feature as are the 36 horseshoe pitching lanes, busy from dawn to dark, and the hundreds of tables around which are grouped players of chess, checkers and dominoes. If you want to participate in any of these contests you must either arrive at the park early in the day or else wait your turn.

It seems that every person in St. Petersburg, at one hour or another, finds time daily for a few rounds of horseshoe hurling, the pastime which has been revived and dignified in St. Petersburg and other winter resorts in Florida. If you do not wish to toss the equine footwear, there are many other freak sports and games provided for your amusement. Croquet, roque and lawn bowling are foremost. Lawn bowling was introduced by Canadians—there are hundreds of Canadian families that migrate to Florida every winter as soon as Jack Frost begins his annual jambouree in the Northland—and a large club with headquarters at Mirror Lake has been formed. The 600 active members of this organization engage in daily contests and tournaments on the 14 clay and marl courts which they have built.

The open-face post office is unique.

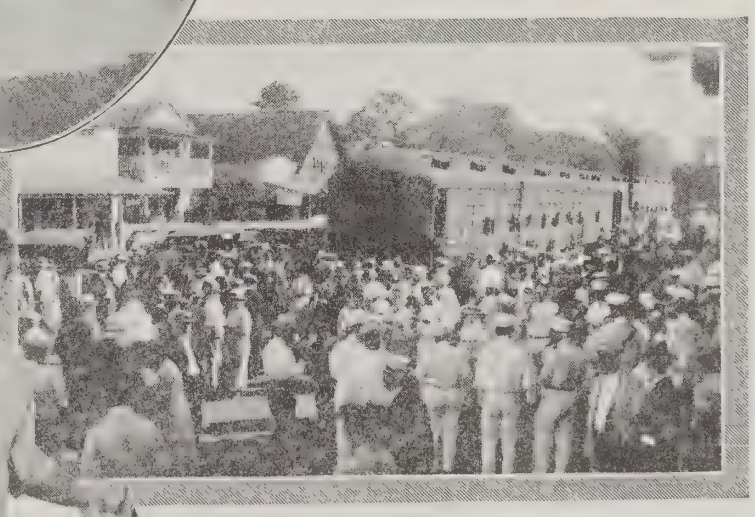
Roque, a close cousin to the old-fashioned game of croquet, is also featured. In fact, tournaments of the National Roque League and the American Roque Association are held in St. Petersburg. These championship contests attract many enthusiasts, but the great majority of popular interest centers in the annual tournament of the National Horseshoe Pitchers' Association. The game of tossing "ringers" is something in which all are interested. It is easy to learn and simple to watch. It is the favorite game of the oldsters who derive great pleasure and beneficial exercise from the sport. To illustrate what St. Petersburg thinks of the ratio that exists between horseshoes and health, it is notable that the city authorities now maintain 85 public horseshoe pitching lanes while there are several hundred additional private "barnyard golf" courses scattered over the city. Water Front Park on the seashore has now been in use about one year and contains 48 fine lanes with elevated bleachers for 2,500 spectators surrounding the extraordinary courts.

The annual national tournament of the "slipper slammers," as the horseshoe hurlers are called, has been held at St. Petersburg ever since the inception of the organization five years ago. State champions gather several weeks before the big event comes off to train intensively for the tossing contest. Some are so expert that they can toss "ringers" on regulation, standard courts while heavily blindfolded. The matches have become so popular that the round-up battles to pick the national winners can no longer be held over the regular St. Petersburg courts because of lack of adequate accommodations for the onlookers. The ball park is used.

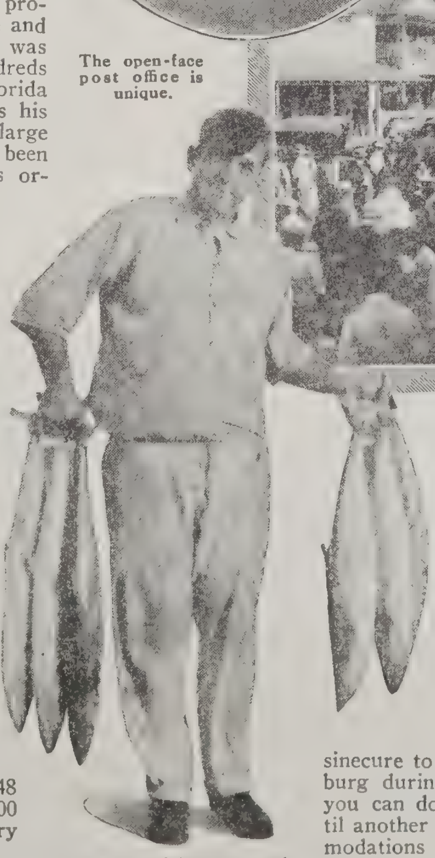
St. Petersburg, the Florida city that was named by the toss of a coin.

John Miller, of Rock Valley, Iowa, is one of the most interesting of the characters who daily visit the "slipper slamming" links. This veteran player is 83 and is one of the most adept pitchers in the country. Two years ago, he won the national championship and in every title contest he ranks high.

"My health was bad and I took up pitching horseshoes for exercise 32 years ago," Miller replied to my question concerning how long he had been playing the rural game. "Shortly, my physical condition improved very greatly. I attributed the cure to quoits and ever since that time, when the weather is favorable, I pitch horseshoes for an hour or two each day. Some days, I walk four to five miles back and forth across the lanes. I claim that any person who will pitch horseshoes regularly will never suffer from appendicitis."



Meeting the trains at St. Petersburg is the daily diversion of hundreds of tourists.



This lucky fisherman caught 26 king fish in one hour out in Tampa Bay.

If you think it is any sinecure to obtain lodging in St. Petersburg during the season, the best thing you can do is to put off your visit until another year and then reserve accommodations in June if you expect to go South the following December. The writer, all unsuspicious of what was ahead of him, motored into this resort center one morning in February and spent the balance of the day trying to find a bed to sleep in. At the thirteenth hotel which he visited he finally was invited to remain and record his address on the register. That was only because a guest had been called away suddenly to attend a funeral. Last winter, the city was so overcrowded that all the larger hotels pitched small tents on their roofs where they accommodated the overflow which otherwise would have had to sit up on the green benches all night.

St. Petersburg is the city of "tray toters" if ever there was one such. California may have been the originator of the cafeteria but the Florida seaport is easily the champion when it comes to the number of these rush-order food emporiums and the daily patronage which they receive during the resort season. The cafeteria is the common leveler which respects neither bank account nor family escutcheon. In St. Petersburg it is the boon companion of the famous green benches in divorcing the peacock feathers and veneer from pompous personages. You may park one of the cheapest or one of the most costly automobiles made before the cafeteria, you may have only the price of a lunch in your pocket or you may be able to sign your check for six figures. Irrespective of your assets and worldly goods you figure only as a link in a long line of hungry people when you enter the cafeteria. As a vehicle of democracy which takes the simulation out of strut, the self-serve beanery is a masterpiece of efficiency.

There was a time when St. Petersburg was the rendezvous of thousands of motor tourists who journeyed to Florida cross-country style in every conceivable kind of an automobile loaded down with tents, camping utensils, portable stoves, cots, supplies and foodstuffs. When they reached St. Petersburg, they would pitch their tents on the free grounds provided by the city and remain there until the following spring when like the birds of the field they would again migrate to their summer homes in the North. However, as St. Petersburg expanded its building limits, the land which constituted the original tourist camp was subdivided into private lots. The 2,500 campers who wintered at St. Petersburg in 1919 have now dwindled to less than 750.

St. Petersburg is probably the only city in the country which has to maintain policemen at all her churches every Sunday to keep the crowds moving and finally get them seated.

The only "Yankee" mayor in all Dixieland is Frank F. Pulver, of St. Petersburg, a Republican who won his way to office as a result of a torchlight campaign —that used to be typical in Ohio and Indiana.

Conditions are so pleasant and uniform that many stores front upon the streets and avenues without doors or windows. One of the newspapers has such faith in the regular functioning of "Old Sol" that it gives away its entire issue of 12,000 copies every day that the sun does not shine. During the last 12 years, this publishing company has only had to circulate 70 of its issues free.

There are more than 600 different varieties of fish in Tampa Bay awaiting the clever arts and artifices of piscatorial experts who come South every winter.

Industry's Use of the Intelligence Test

Cuts Labor Turn Over, Fits Workers Into Positions of Opportunity

By J. OLIN HOWE

SALLY JONES took an intelligence test the other day, one of the so-called psychological tests, and ranked high. Had this test been available a dozen years ago, when Sally graduated from high school and joined the clerical force of a big manufacturing corporation, her relative value to the company could have been determined by it at once. Her superiors would have learned her true capability in the beginning as accurately as 12 years' experience with her has finally shown it.

Sally's family would hardly have considered her going into a factory, but clerical work seemed different, as it did to the others of the hundred sweet girl graduates who found similar places with the corporation at that time.

At the end of five years three-quarters of them had married, as doubtless all looked forward to doing when they left school for the busy world outside. Sally didn't happen to, nor did she become sufficiently interested in her job to use her rather keen mind on it beyond a point where she satisfied her conscience—at least, for a long time.

She did her work, merely routine office work, each day, but this didn't really distract her mind from the dances and other evening and social affairs which to her were of first importance. Ten per cent of the girls who entered the company's employ with her left for other occupations. Two college graduates among them were successful with a tiny tea shop. Another girl went into advertising and still another did well painting Christmas cards of unusual quality; but Sally Jones had no special genius for other things.

After a while, however, she did begin to see something in the work she was doing and the time came when, though she still went to dances and picnics, next day she put these out of her mind and gave herself wholly to her job. This was noted in the office and at the end of four years, especially since in recent months she had been particularly conscientious, Sally was promoted to fill a new place which had opened up.

The new work took her interest at once and through application to it she did so well that shortly another promotion came. The inevitable progression of more interesting work, closer attention, followed by still more interesting work was fairly started.

Today Sally Jones is buying all the paper for the corporation and has the spending of half a million dollars a year. Her outside interests, which for long have ranked as relatively unimportant, are perhaps a bit more staid than they were, but she is fully as active in them, outside business hours.

She is a fixture with the concern, a valuable factor in its office organization. It has taken 12 years to make clear just how valuable. She may marry, though each year makes that less likely, but if she doesn't still better things are in prospect for her with the company.

A word about Mary Simmons, who was Sally's best chum in those earlier years just after they entered the corporation's employ, a fine girl but not in Sally Jones' class mentally. When Sally was promoted out of the routine work they did then, she left Mary behind and Mary is still in the same section, a loyal, careful worker, giving full measure to the company. In time she hopes to be chief of her section.

Sally's Score 140; Mary's, 83

SHE doesn't mind doing the same thing over and over. Surmounting its difficulties, always greater to her than to Sally, has been more interesting than otherwise. She would like more pay, but has been fairly philosophical about it. Sally Jones took too many chances and introduced too many new ideas for her.

Sally and Mary both took the intelligence test, as did all the rest of the office workers. Out of a possible 150, Sally scored 140 and Mary, 83. With this information in front of him, an executive of the corporation could have placed their potentialities with perfect assurance at the outset and years would have been saved. Provided they remained with the company, of course; he couldn't have known about that.

The Division of Co-operative Research of the Carnegie Institute of Technology at Pittsburgh has gone deeply into the use of intelligence tests in industry and general business—these cases are two among the many it has investigated—and finds that 75 per cent of young women who go into clerical work, whether of high intelligence or low, leave for marriage within five years.

Ten per cent leave for other reasons and 15 per cent remain with the company, those of high intelligence to work up to responsible positions, the others to remain in routine work.

Of these latter the intelligence tests can now be depended on to show at once which is to be which; as they can of the young men without experience who go into clerical work. The figures in their case are different. Among those of high intelligence 50 per cent leave within five years, 15 per cent leave when between 30 and 40, 20 per cent remain and grow into good positions and 15 per cent remain in fair positions and build up remunerative businesses outside.

Of those of low intelligence, 40 per cent leave within five years, 20 per cent grow into supervisors of routine work after long service, 30 per cent make good routine clerks and the remaining 15 per cent leave after 15 or 20 years of service.

The fact is that in America today we are nearer than ever to the ideal in which each individual is doing the work for which he or she is by nature best fitted and in which each is therefore happiest. Not that such a condition is just 'round the corner.

Testing mentality is ever being turned to greater account in the workaday world. We built the American Army on the basis of the intelligence test, and right there it made good; since the war, scores of colleges and universities in this country have adopted it as substitute for or complement to the conventional entrance examination and assort freshman material with it to splendid advantage; and latterly the scientific measurement of intelligence is making its way more and more into practical affairs.

In fact, American business has been waiting for psychology, though that will seem a peculiar statement after the liberal way in which the term has been misused in the last decade, applied to everything from after-dinner speaking to all sorts of salesmanship, from motion pictures to prohibition, from newspaper colyums to profound metaphysics.

The greatest difficulty, perhaps, comes from the fact that the scientists who work out the real discoveries in psychology are teachers, paid for teaching and for such research as will improve their teaching, who are largely out of contact with business or industry. There is now a means through which their learning may be utilized.

We are nowhere near a national mental census yet. Indeed, such a thing may never come to pass, but when you have finished this article I believe you will see the value of it; and we have men fully capable of making it accurate, comprehensive and thoroughly efficient.

What is of the utmost importance is that the intelligence test does give relief from the old and terribly expensive method of hire-and-fire.

There is the proverbial instance in which the hiring-on window of a great plant was presided over by a one-legged man who had lost the other in the concern's employ. He had a life job. "On Mondays," he said, "I turns down all the men with white collars, on Tuesdays all with blue eyes, on Wednesdays all with dark eyes. Red-headed men I never hires and there do be days when I has a grouch on and only hires every tenth man."

Physiognomy and Mentality

NOR is this so extreme an instance as it might seem to the uninitiated. Is it to be wondered at that American business men have turned to whatever means of selecting employes seemed to hold out any promise? They have tried everything, from the not so distant day when the "perfesser of phrenology" passed his hand over the cranium of a newborn babe and told how much money the child would have at 50 and how he would best set about accumulating it.

Physiognomy appeared to have something in it awhile back and professed experts read facial contours for some of our leading corporations. Their method was the determination of character and mental characteristics on the basis of concave, convex or plane profile, size of nose, ear or eye and the like. But this has been pretty completely exploded by scientists after diligent research which included examination of thousands of individuals.

These have no hesitation in saying that no measurement of feature or variation in facial outline has anything indicative to do with mentality. In just one measurement was there found a trace of correlation with intelligence and character—in the size of the nose—which was of interest chiefly because the scientist who led in this work chances to have a rather good-sized nose.

We have another type of "experts" to whom one may walk in off the sidewalk and who will chart one's vocational possibilities and probabilities and prescribe a walk in life offhand. If these have any success, it is due to no truly scientific background, but to good luck in the application of ordinary common sense.

For psychology, the actual science, hasn't gone anything like that far. A leading psychologist recently showed me a desk drawer full of literature and advertisements he had collected in which this sort of uplift bunk was phrased in flowery fashion. Nothing scientific about a bit of it.

In this connection Dr. Henry C. Link, who wrote "Employment Psychology" and is a high authority on this subject, tells in his book how deep an impression he once made on a group of hard-headed business men to whom he was introduced as a psychologist. To one he said, "You are a Cornell man, are you not?" This chanced to be true and the astonished group looked in awe at the psychologist whose uncanny insight could give him personal facts about an entire stranger.

The point is that this was the merest lucky guess on the doctor's part. How could any science determine a stranger's alma mater? Science is the formulation and application of standardized knowledge in a given field.

Measurement of mental equipment is quite another matter, something which can be done and the doing of which has been standardized as far as the psychologists have gone. Applied science gives a sound and trustworthy basis for choosing employes. Intelligence may be defined as the ability to learn and to make use of what is learned and 'tis no difficult thing for the psychologist to find the degree to which one has it.

Yet psychology is no panacea, no blanket prescription. Certain things the science can do, since the way of doing them has been fully worked out, and the scientist sees a vista of many other things possible to it and even of its universal application when research which has been quietly going on for 50 years is carried far enough.

Today mechanical ability, using the term broadly, musical talent and the ability to do school work are covered by the intelligence test. Extending it to other fields is only routine work, but of the most painstaking kind.

And clerical workers of every sort can be sized up by this method as in no other way. If you wish to hire a new secretary or only a plain stenographer or a filing clerk or other office assistant, get together your prospects as you choose—advertising is the common method—but do not waste time trying to get at their relative intelligence and probable usefulness.

Simply send the whole lot off to the psychologist, who uses his mental probe and in a couple of days gives you a report in which they are graded more exactly than long experience with them would enable you to do it.

An organization of college professors and other scientists whose names are in Who's Who will attend to this. And after taking out a very modest return, their profits, if any, are spent on further research.

Applicants are given a hundred-word business letter to write on the typewriter as quickly and accurately as they can. Then they write the same letter from memory, far from as easy as it sounds. Another letter of similar length is given them with 10 words omitted and 10 mistakes each in spelling, capitalization and punctuation and paragraphing, which is corrected in their own handwriting.

They sort alphabetically under states and towns as quickly as they can envelopes or cards addressed in handwriting of average legibility. Then they find and record as rapidly as possible call numbers arranged to eliminate practice with the ordinary telephone book.

These are tests of special intelligence which comes from training or experience. They aren't so mystifying but are just as essential as the general intelligence test which is the main reliance. Perhaps that compiled by Dr. Arthur S. Otis, of San Francisco, or one of the series of Professor E. L. Thorndike, of Columbia, is employed. Dr. Thorndike figured prominently in army psychological work and is the author of tests used in educational institutions. The latter has made up a variety of these tests for large insurance companies and they have been used with no little success.

The method with the clerical workers is similar to that in use in all industrial psychological work. The work to be done by candidates, or already being done by a group the psychologist is asked to grade, is studied and tests are arranged to give a reliable index of special intelligence; and these are combined with a dependable general intelligence test. Often the former is even more important, for jobs are apt to depend on kinds of intelligence rather than degrees.

In a footwear industry of national prominence six psychologists are now engaged in a first-hand study of the different operations in the industry. They will eventually devise a set of tests which will give the corporation a quick and accurate means of ascertaining the mental level of all employes and applicants for employment. Similar activity is going on in many an American factory.

"Where Does the Sun Rise?"

RECENTLY I had the privilege of going over the papers of 150 girls who had taken the tests described for clerical workers, applicants for jobs with a sizeable corporation which has cast aside various other methods of hiring, including more or less fake psychology. The highest possible score was 54 and one girl made 51. The lowest was but 15, with 30 to 35 as the average.

The girl who scored 51 is the daughter of an editor, a very superior girl, who had taken a fine position elsewhere before this concern could hire her. She actually wrote the hundred-word letter from memory with but one error and there she used a word which seemed to me better than the original. She did the Otis intelligence test in 25 minutes, making a perfect score, when a candidate is permitted an hour to answer its 75 questions.

The girl who scored 15 is a moron, deficient in intelligence. Yet even in colleges they find a place for morons, and in industry they fill in perfectly well in routine jobs.

There is an amusing story about one such who was asked to tell whether the sun rose in the east or the west. "That's a hard one," she said after she had pondered it awhile. "Why, don't you know where the sun rises?" asked the examiner. "Well, I used to know that, but I forget."

Dr. Thorndike revised the Army Alpha tests, by which millions of men were tested for everything from kitchen police to the general staff, and Columbia was the first university to adopt them for freshman entrance in 1919. The University of Pennsylvania followed. Their use is general today in American educational institutions.

The Army Alpha test separated those who took it into but five mental classes, morons being one. Professor Thorndike has since refined his tests to segregate human intelligence in far greater detail. He has made them surprisingly sensitive to minute differences between individuals. He uses 21 different kinds of tasks and varies them amazingly.

The highest classes in Army Alpha were superior and very superior. Dr. Thorndike separates these two into more than 20. His tests apply the finest of gauges to mental alertness, analysis, initiative, perseverance and endurance. How much do you really know and to what extent can you make your knowledge serve you on demand?

"It should be borne in mind," he says, "that these are not untried tests which psychologists merely think will indicate intelligence. Back of them is a long, long

(Concluded on page 14)

Which Trees Do Best in City and Town?

Many Things to Be Considered Before Ornamental Planting Is Begun

By ROBERT H. MOULTON

THE need of trees on town and city streets is so apparent that no argument is necessary to induce municipalities and individual owners to plant and care for them; they not only make for the beauty of a city but for the health and comfort of its citizens. Strangely enough, however, and notwithstanding the numerous tree-planting programs which have been carried out all over the country in recent years, there still exists a great deal of misunderstanding regarding the kinds of trees best adapted for city streets.

In recognition of this fact, and with a view to obtaining scientifically exact information on the subject, government horticulturists have for a long time been experimenting with a variety of trees in different localities throughout the nation. The result of these experiments, which have just been announced, has been to upset many previously conceived ideas on the subject.

It has been determined, for instance, that oaks are the best trees for street planting. It is probable that oaks have not been more widely planted because of the prevalent belief that they are slow growers, and because in the North they are rather difficult to transplant. A white oak, however, which is one of the slow-growing varieties, will reach the same height as a sugar maple in the same period of time, and maples have been used more widely than oaks for street ornamentation, despite many unsatisfactory characteristics. Elms are given second place in desirability for city streets by the government experts and sycamores third. Maples are considered less desirable than has been generally supposed. Except the Lombardy poplar, most varieties of poplars are not recommended.

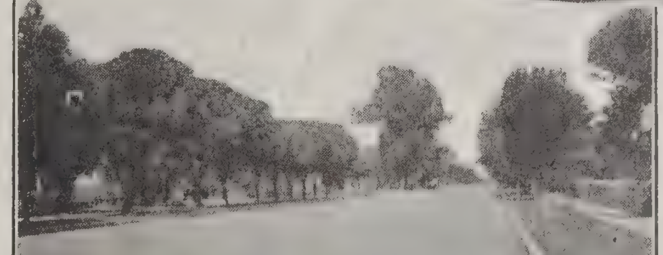
The American elm is one of the best and most popular trees for street planting.

Before ornamental tree-planting for town or city streets is undertaken, a number of important points must be given attention. Trees native to one part of the United States may not thrive in another region. Some trees are objectionable because their roots penetrate defective sewers, while others grow their roots so near the surface that they have a tendency to heave or crack sidewalks.

Only vigorous trees that will withstand the dust and smoke of a city should be planted to ornament the streets. The root system should be hardy, not easily affected by unusual soil conditions, by restricted feeding areas, or by root pruning in case street improvements are made. The shape of the top of the tree should be suited to the width of the street; in general it should be rather high-headed or easily trained to that form and of open growth.

Of only a little less importance is the character of the foliage masses, whether dark or light, heavy and somber, or open and airy, and also whether the foliage has vivid autumn colorings. The resistance of the tree to fungi, insect pests, and tree diseases is another important consideration. Trees that bear showy flowers, fruits, or nuts are usually undesirable for street planting.

Palms do not make good shade trees, although they are effective in formal planting. Only in the most southern parts of the country and in Western California should evergreen trees be considered for street planting. Magnolias, live oaks, and a few other broad-leaved evergreens may be used in these regions. Where there is lack of sunshine in winter, due to short or cloudy days, it is desirable to admit all the light possible by using only deciduous trees. In all sections trees differ greatly in the time when they put out their leaves in the spring and lose them in the autumn. Narrow streets should be planted with tall slender trees like the Lombardy poplar, or in some cases with small trees. Broad streets may be planted with spreading trees, or, if provided with a central parking space, with moderate-sized trees in the center and on the sides, or with trees on the sides suited to the space and formal trees in the center. As a rule, native trees that have been tried out successfully in other towns of the same general locality should be given the preference.



Miscellaneous planting of trees on streets is ill advised both from the standpoint of beauty and longevity of the trees.

For use within reach of ocean spray or on sandy lands near the coast the red oak and the red or scarlet maple are suitable as far south as Charleston, South Carolina, while the sweet gum and the live oak are equally good from Norfolk southward and along the Gulf of Mexico. The red oak, sweet gum, red maple, and eastern live oak are all grown successfully along the Pacific Ocean, while the California live oak can be used from San Francisco southward.

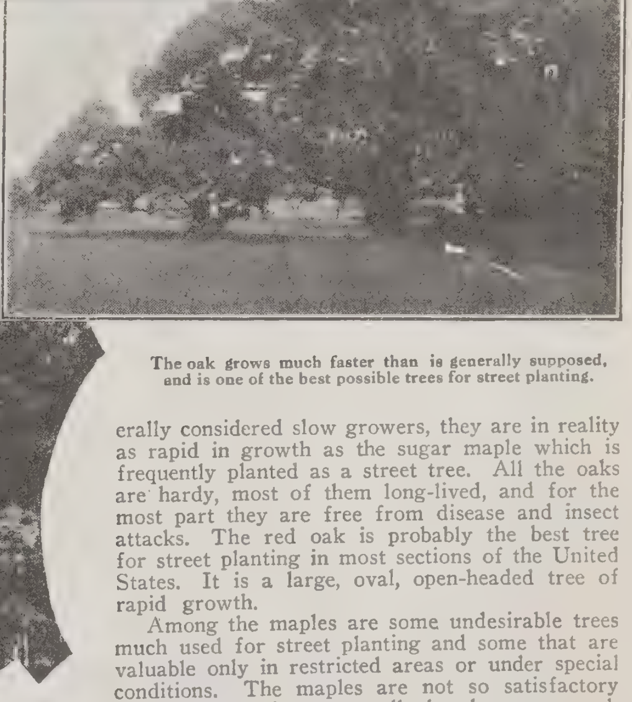
Silver maples produce a nice shade, but are not so desirable as oaks, and do not grow any faster.

In the heart of a city, where the greatest difficulty is experienced in getting trees to grow, the ailanthus, or tree of heaven, will probably thrive when nearly all other kinds fail. The staminate and pistillate flowers of this species are borne on separate trees. Only the pistillate trees should be used, as the odor of the blossoms of the staminate trees is very objectionable for about 10 days. These may be produced by grafting from pistillate trees or by propagating from suckers or root cuttings from such trees if they have not been grafted.

The American elm, sometimes called the white elm and water elm, is one of the handsomest American shade trees. It has been the standard street tree of New England, giving to the roadsides and village streets the characteristic appearance which is so attractive to summer visitors. The elm is tall and spreading, and where planted as near together as is customary on streets and country roads the effect of the mature trees is that of an arch formed by the growing together of their spreading tops. It is of rapid growth and long lived. This elm drops its leaves very early in the autumn, but it comes into leaf early in the spring.

Because of the attacks of the elm leaf-beetle and the European elm bark louse, many handsome trees have been severely damaged or killed before communities were properly equipped for fighting them, but with careful spraying, these insects may be kept in check. On account of the existence of these pests and because they are gradually spreading to new territory, tree planters should consider carefully whether it is advisable to plant the elm.

Of all the trees used for street planting the oaks undeniably are the best. Although some of the handsomest species, like the white oak and live oak, are generally considered slow growers, they are in reality as rapid in growth as the sugar maple which is frequently planted as a street tree. All the oaks are hardy, most of them long-lived, and for the most part they are free from disease and insect attacks. The red oak is probably the best tree for street planting in most sections of the United States. It is a large, oval, open-headed tree of rapid growth.



The oak grows much faster than is generally supposed, and is one of the best possible trees for street planting.

Among the maples are some undesirable trees much used for street planting and some that are valuable only in restricted areas or under special conditions. The maples are not so satisfactory for street planting as usually has been supposed, few of the species being suitable for this purpose and these only in a limited way.

The red maple, scarlet maple, or swamp maple is one of the most widely distributed American trees. It is found from Canada to the Gulf of Mexico and west to the Rocky Mountains. Its leaves are the smallest of the eastern native maples, but it grows large and is usually of upright outline. It is better adapted to suburban conditions than to city streets and is one of the few trees that succeed well near the ocean. It has bright-red blossoms before the leaves appear, and the young leaves and fruits are also red. The mature leaves begin to color early, some branches coloring as early as the middle of July, assuming brilliant reds and yellows and staying on longer than those of the sugar maple. This handsome tree is not so much used as it deserves to be.

The silver maple, also called the soft maple, white maple, and swamp maple, is probably more used for street planting through the whole United States than any other tree, although it is one of the least desirable. It is usually planted because it is a quick-growing tree, but it is not more rapid in growth than several other trees that are much better. There are three serious objections to its use as a street tree. The first is its brittle wood; the second, its shallow rooting; the third, its tendency to decay. It does not stand pruning as well as most other street trees, and it probably has been pruned more ruthlessly than any other.

Public Debt—a Menace to All Nations

Billions—at Interest—Pile Up to Harass Poor Folk Who Must Pay Taxes

By JAMES MARTIN MILLER

This is the second of two articles by Mr. Miller on the subject.

OF THE $8,500,000,000 of state, municipal and village bonds outstanding, a little less than one-eighth are the obligations of states. The Bureau of the Census recently issued a report showing that 17 states have expenditures amounting to more than their revenues.

BOND SALES FOR CALENDAR YEAR 1921

State bonds	$ 290,892,900
County bonds	204,320,453
School district bonds	141,769,602
City, village, township	571,785,319
Total for year	$1,208,768,274

Of the total indebtedness of the states of $1,071,506,981.28, the money was expended as follows: 34.3 per cent of it, or $367,687,100 for highways; 20 per cent, or $213,891,400 for waterways and harbors; 12.1 per cent, or $130,022,000 for soldiers' bonuses; 11 per cent, or $118,557,513.42 for funding operations; 9.5 per cent, or $101,550,561 for "other improvements"; 4.2 per cent, or $45,156,139.39 for agricultural aid; 1.9 per cent, or $20,254,523.28 for public buildings; 1.9 per cent, or $19,710,750 for welfare interests; 1.8 per cent, or $19,331,406.68 for miscellaneous; 1.7 per cent, or $18,440,810.07 for military purposes; 1.6 per cent, or $16,904,282.44 for education. Lest there be confusion regarding the small amount used for education, let it be explained here that the public schools are taken care of by the school districts and municipalities, and are not a state matter except for the institutions of higher education.

Four States Without Debt

BESIDES the indebtedness of the 48 states, the cities, and other political subdivisions within the states, have an additional indebtedness of $7,428,494,021.72. The amount named above as the indebtedness of the state governments, includes only the gross bonded indebtedness and does not take account of temporary indebtedness, or of sinking funds for paying off these debts.

New York State has a bonded debt aggregating $267,784,000, which gives it the largest debt of any state. Massachusetts is second with a debt of $138,049,134.53, of which a large proportion represents the value of its metropolitan district improvements and highways. California ranks third with a debt of $73,683,000, Pennsylvania fourth with a debt of $50,658,320.26, South Dakota fifth and Michigan sixth with debts of $47,700,000 and $45,550,000 respectively.

Four states have no bonded indebtedness. These are Kansas, Kentucky, Nebraska and Wisconsin. Kentucky, however, is owing $5,312,438.77 on outstanding warrants and Wisconsin is indebted only to its trust funds to the extent of $2,275,991.77. New England has the highest per capita debt of any section or group of states. Its debt per inhabitant is $24.38, nearly two and one-half times the average for the United States.

South Dakota has the highest per capita debt of any state in the Union, it being $75.02 for each inhabitant, which is seven and a half times the average per capita state debt for the nation. Oregon owes $54.50 per capita, Massachusetts $35.83, New York $25.79, Louisiana $23.67 and Utah a per capita debt of $22.33.

The Pacific Coast group of states, Washington, Oregon and California, are second to New England, having a per capita debt of $23.15. The Middle Atlantic group of states, New York, New Jersey and Pennsylvania, have a per capita debt of $15.07 and the Mountain states, Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah and Nevada, of $12.07.

Below the average for the country as a whole are all divisions in the Middle West, the East North Central division having a per capita debt of $3.69; the West North Central, $7.39; the South Atlantic, $9.20; the East South Central, $4.06; and the West South Central, $5.26.

Whatever may be the theoretical justification of public expenditures, cognizance must be taken of the fact that, in volume, *expenditures, which means a staggering increase of taxes, are growing at a rapid rate.* The evidence upon this point is cumulative, but not comprehensive. A survey of the situation reveals that, in many states and municipalities, *the expenditures exceed the revenues* and this has, too often, been true of the national government; this too in normal years when we are not called upon to finance a war. It is not necessary to go into the subject of the reckless and terrible waste of war and the penalties that follow war for generations.

It is only within the past hundred years that municipalities have become debtors to any considerable extent; but up to 1914, the year the war started, the aggregate of municipal debts in the United States exceeded the national debt in magnitude. There is a deep-seated conviction among the people that municipal politics have exploited the people; and it may be said, with justification, that state and national politics are far from being free from this taint.

Secretary of the Treasury Mellon said to the writer the other day that *he had never known of any two experts on finance to agree altogether on money and public indebtedness.* A century ago when we got fairly started into the public debt business (debt *is* "a business" in this day more than ever, because the class of people engaged in the debt business must have bonds and securities in order to make more money) the theory was held by many writers on finance that a public debt increased a nation's wealth. Public bonds were regarded as a net addition to capital. The claim was advanced that a public debt was a matter of indifference to the state, since it merely represented money owed by one set of citizens to another. That great expert, Adam Smith, and his array of followers, on the other hand, regarded a public debt as an unqualified evil. While, of course, there are circumstances under which the creation of public debt is abundantly justified, it remains true that in practice, debts are often contracted to public detriment. The ease with which money is raised by loans leads often to reckless financiering.

What War Did for Debt

WE WILL make a comparison of the pre-war debts and post-war debts of some of the principal nations, although we are considering here the public debts, of all kinds, of the United States. We cannot have impressed upon us too much the results of destructive war. Before the war (1913 figures) the debts of all the nations of the world amounted to $43,200,931,000. Now the debt of France alone amounts to some $7,000,000,000 more than all the world owed before the war, and that of Germany nearly $28,000,000,000 more than all the nations of the world owed before the war. Great Britain owes nearly as much as the world owed in 1913, and the United States half as much. Canada owed $544,391,000 in 1913 and $2,349,180,110 in 1922; Australia had an $80,753,000 pre-war debt and has a $1,583,000,000 post-war debt. All the nations of the world in 1913 owed $43,200,931,000 and $382,634,000,000 in 1922, or more than eight times as much after the war as the year before it started.

Nearly a century and a half ago Adam Smith wrote this warning: "The progress of the enormous debts, which at present oppress and will in the long run probably ruin all the great nations of Europe, has been pretty uniform." His prophecy has come true. At that time Great Britain owed about $640,000,000, now the United Kingdom has a debt of more than $40,000,000,000. The United States had no debt when Adam Smith made his prophecy. Now the United States has a debt of more than $22,000,000,000.

The theory of the sinking fund has not always worked very well in practice on the part of our national government, as well as by our states and municipalities. With well-managed private firms and corporations, however, it is constantly being demonstrated that the theory of the sinking fund is practicable and indispensable. On questions of finance, debt and money there are very few men, even among the so-called experts, who are in accord. It is the same with political administrations. In comes a new national, state, county or municipal administration with entirely different ideas from those of the outgoing one. The old set of officials played politics with the public debt, the methods of taxation, whether it be the "direct" kind or the tariff, and so on. And the new administration does the same.

Then, there may be other reasons than politics, at times, that contribute to the defects of the sinking fund principle, in public affairs, at least. The nation, state or city does not always have the money available for the sinking fund. Besides it is not always expedient to purchase bonds in "the market" because of the premiums on them.

How United States Spends Its Money

STATESMEN like Pitt and Hamilton were strong advocates of the sinking fund, which contemplates the gradual extinction of a debt, provided by the law authorizing the debt. The sinking fund theory has never been followed to its logical conclusion by our Federal government nor the local governments. Modifications of one sort or another have been introduced which have left the original institution little more than the name. This is shown by the history of the sinking fund in the United States.

By the law enacted on February 25, 1862, it was provided, after the gold receipts from customs had been used to pay the interest, they were to be applied "to the purchase or payment of one per centum of the entire debt . . . . to be made within each fiscal year, which is to be set apart as a sinking fund, and the interest of which shall in like manner be applied." No obligation could be more formal or legal yet it was never observed. No attention whatever was paid to this provision of the law after the Civil War, and at its close the payments and purchases did not proceed in the orderly fashion prescribed by law. Since then our officials have taken the position that whenever the financial condition of the treasury warrants a repayment of debt there are simpler methods of proceeding than sinking fund arrangements. Up to July 2, 1922, bonds could be called in or purchased in "the market." This cannot be done now.

All sinking fund laws were swept aside, or repealed, by the Victory and Liberty loan acts (Section 6) of March 3, 1919. The Secretary of the Treasury is ex-officio commissioner of the sinking fund who acts with the Commissioner of the Public Debt, W. S. Broughton. In addition to the sinking fund, all receipts from the principal of foreign loans, but not the interest, goes into the Treasury to apply to the redemption of the public debt, but only to redeem Liberty bonds and Victory notes. The interest on foreign loans goes into the general fund. The Secretary of the Treasury has very elastic powers in using any surplus funds, within appropriations made by Congress.

Congress now makes an appropriation, each year, to the sinking fund of two and one-half per cent of Liberty bonds and Victory notes, outstanding, less the par amount of foreign obligations, held by the United States Government on July 1, 1920. This is a fixed credit of $253,404,900 plus about $5,748,000 which latter varies from year to year.

What Uncle Sam has spent most of his money for since 1791:

For civil administration of government, $25,917,926,161; for war (War Department), $25,726,187,612; for war (Navy Department), $8,754,563,023; total, $34,480,750,635.

It will be seen that all the civil departments of the government cost $8,562,824,474 less than the preparations for, and the prosecution of wars, for the 131 years since 1791.

During the five years, 1918-19-20-21-22 the United States paid out in interest on the public debt $4,542,168,410. During the 127 years between 1791 and 1918 we paid out in interest $2,683,685,495, or $1,858,482,915 less, in the more than a century and a quarter period, than we did in the five-year period since 1918!

A study of the War and Navy Department expenditures for 1920-21 and 22 indicates that this government is spending more on the war establishments than we have ever done during any "peace" years. This notwithstanding "disarmament conferences." The answer of official Washington, in explaining this, is that war materials and other expenditures for the war establishments are, like everything else, higher now than ever before and that a dollar spent now for war preparedness will not go as far as 50 cents would before 1914.

Pistol Protection Versus Pistol Prohibition

By WILLIAM LLOYD WARNER

Some months ago The Dearborn Independent published the arguments of those who would do away with the carrying of pistols by prohibiting or curbing the sale. Mr. Warner took issue with the first presentation and was invited to give his reasons.

THE individual who would correct all evils, and incidentally impose his own definition of an evil, by the passing of laws, becomes more and more an abundant product of this American soil. If, in the opinion of some individual, there is anything that is displeasing in his neighbors' actions, then there can be but one thing to do—pass a law against them. If the would-be law-passer thinks he has solved the "problem," he immediately gets in contact with his attorney, frames a law covering his vision, and then sends it to the state legislature or to his representative at Washington. I might have added that often, before he forwards his bill to the legislative halls, he gathers other law-passers together and he forms the Society for the Prevention of This or for the Saving of That, which duly impresses the gentlemen who depend on votes for their positions. Ninety-nine times out of a hundred, such a *scheme* will not work. Of such is the movement for the complete abolition of the pistol and the revolver in the United States.

Following the war, there was a great increase of crime and lawlessness throughout the country. The nation became rightly alarmed, sermons were preached, conferences were held and the press filled its columns with editorials of protest and advice. Out of this national alarm, there were offered many ill-thought-out schemes to abolish crime. Emotionalism, rather than thought, was back of most of these plans.

One plan, which has been widely advertised, is to abolish the pistol. The argument is, that as the revolver is used in the commission of so many crimes and is the means of so many deaths, therefore, if we abolish it, the problem will be largely solved, since without the gun, most of such crimes could not be committed.

Now, the reduction of crime to an absolute minimum is, of course, something that is devoutly wished for by all decent people. All measures and methods proposed for its attainment deserve the earnest consideration of all the readers of THE DEARBORN INDEPENDENT. So does this proposal to eliminate the pistol and revolver. If it will accomplish its purpose it deserves the support of all of us. If it will not accomplish its purpose, but, on the contrary, will have exactly the opposite effect to that intended, then it should have the strongest opposition from every one of us that we are able to bring to bear. If the effect of laws prohibiting the ownership of pistols and revolvers by private citizens will be not to reduce crime but *actually to increase it* (?), then it behooves us to do our part to see to it that these proposed laws never become existent. Let us, therefore, look into the anti-pistol law and see what it will actually do if enacted.

There are, literally, hundreds of thousands of pistols and revolvers now in the possession of our criminal class. A very small percentage, indeed, of these criminal gun owners have permits. Practically speaking,

(*Concluded on page 13*)

Nursing and Taming Beavers With a Bottle

Farms to Raise Little Animals; Held an Aid to Conservation

By S. R. WINTERS

BEAVERS are commonly associated with the imagery of shy creatures industriously at work felling trees across streams in the wilderness (by use of their strong, gnawing teeth) to build homes on watery banks. This picture, while representing them as skillful architects, suggests their wild life and a readiness to repair to cover on the approach of mankind. The other side of the picture was recently revealed by Dr. Vernon Bailey of the Biological Survev of the United States Department of Agriculture in an address before the Biological Society at the Cosmos Club, in Washington. Beavers taken captive in Wisconsin and Minnesota were described as domesticated animals which had been developed into affectionate pets, drinking cow's milk from a nursing bottle. And, if denied warm milk, they would cry.

The Biological Survey, through its field naturalists, has brought into captivity from the forests of Wisconsin, Minnesota, and the Adirondack Mountains, many young beavers. Their habits are being studied with the hope of domesticating them for beaver farms to act as sources for replenishing the supply of fur. The problems of capturing, feeding, breeding and controlling of beavers under domesticated conditions have been partially solved by Uncle Sam. However, these animals have been characterized by their destructive tactics in undermining foundations of trails, highways and railroads, as well as burrowing through irrigation channels and doing damage to farms. Beaver farming, therefore, contemplates the introduction of these creatures on suitable areas where they would not prove to be a menace to valuable timber, farming lands, and other property.

Circle—Feeding young beaver from a milk bottle. Left—Heavy trap used by Bureau of Biological Survey for trapping beavers alive. This is too heavy and expensive for popular use. Right—A beaver at work building his home. It requires skill for him to climb in an upright position to the point where the building material is to be deposited.

Dr. Bailey, chief field naturalist of the Bureau of Biological Survey, who spent disturbed nights in giving the nursing bottle to young beavers at midnight and again at four o'clock in the morning, is of the opinion that the beaver is a future asset both as a fur-bearing animal and as a conservation agent. In the latter rôle, he believes that beavers when placed on millions of acres comprising our national forests would render greater service than harm, in conserving water and soil, by weeding out timber of little value, and in yielding a harvest of furs. Reasonable restraint of these animals would avoid damage to valuable trees and streams. Already beavers are found in increasing numbers on Uncle Sam's woodland domains, but the pale western variety dominates. The Bureau of Biological Survey would displace these with the choice, dark, prime fur-bearing kind which could be imported from other sections.

Beaver culture, too, offers an opportunity for the clearing of cut-over timberlands. Like the browsing goat, this tree-cutting creature of the forests can be made to perform the tasks ordinarily assigned to the ax or fire, namely, gnaw down the second growth of aspen, willow and cherry. When acting in such a capacity, the beaver would not only find food for its own sustenance but aid in the reforestation of large areas of land on the northern border of the United States and in Canada. When this land, worthless to agriculture, is thus cleared and again covered with valuable forest timber, the habits of the beaver have been intelligently directed in furthering the ends of civilization. Then, too, the United States Department of Agriculture recommends that beaver culture be pursued in the northern areas of Canada and Alaska, where companies could lease tracts of land to raise the animals for their fur. This would lessen the danger of exterminating the beaver, for the wild scramble to obtain their skins has jeopardized an industry once yielding millions of dollars' worth of furs annually.

The practicability of taming the beaver has been demonstrated in the National Zoological Park at Washington and in the Bronx Park at New York. Young beavers are captured when four or six weeks old, at which periods they weigh from three to four pounds. "Baby" beavers may be located in their houses on banks of streams by their baby-like cries. Shaking the odd domicile or penetrating a stick into the nest chases young beavers from cover, when they may be caught by their tails by persons in a boat or scooped up in wire-mesh dip nets. Young beavers, as well as old ones, may be captured in traps at the edge of the water they are known to frequent. A trap with a drop door is the most simple and effective device for this purpose. Such a door is elevated two and one-half feet and hung from the top by a light trigger, easily sprung, with a string attached to a bit of green aspen tree for bait. The latter is placed in the back of the corral or with a long thread to be pulled from a distance when the beavers are inside.

Beavers intended for farms should be chosen for possessing certain characteristics. The darkest, richest-colored beaver, and therefore the producer of the most valuable fur, is a native of Lake Superior, in Northern Michigan and Wisconsin. Beavers produced in this region of dense forests and heavy snows grow skins superior to those covering the "woodcutters" of Canada and Alaska. The value of the Lake Superior animal is suggested by the fact that it is well protected and is now only taken illegally or for scientific culture. The dark variety of beaver, valuable as the skin may be, will profitably perpetuate itself as breeding stock if fur-farming once gets under way in the United States. Fur grown under domestic conditions commands prices in excess of those grown under wild influences, for the home-produced product can be marketed when the fur is choicest.

"Baby" beavers can be fed on cow's milk from a bottle. Dr. Vernon Bailey, in reporting the results of his studies of young beavers in Minnesota and Wisconsin, said that "they take readily to cow's milk from baby bottles, but demand vociferously to be fed every four hours, night and day. For six weeks, I did not get an unbroken night's sleep, as the 'babies' called loudly for midnight and four o'clock lunches of warmed milk. And, if these were not promptly produced, they cried in irresistibly pitiful, baby-like tones until it was ready. Then they fairly cooed and gurgled in their perfect satisfaction with civilized life.

"They learned to come when called, to follow me about the place, and down to the lake for a swim. Generally they would come out of the water when called, though often reluctantly, and walk or beg to be carried back to their beaver house on the hill. They showed keen intelligence along their own lines of activities but little of the mental powers often ascribed to beavers. They recognized and always welcomed their friends, but the step of an approaching stranger would send them scurrying into their little house. They were timid but playful and most affectionate pets. If beaver farming should develop into a practical industry on suitable areas, a most interesting animal will be added to our domestic series."

When fur-trading was extensively engaged in by the Indians in the early days, the squaws nursed the beavers and fondled them as household pets. If beaver farming gains a foothold, sheep and goats will be used as foster mothers. Cow's milk appears to be too rich as a food for beavers that are being tamed. Therefore, naturalists of the Bureau of Biological Survey skim or boil the fluid. At times the milk is administered in lime water. Young beavers, not unlike babies, cry unless fed at short-time intervals. Every four hours, night and day, they demand small quantities of food. If given food at longer intervals of time they exercise ravenous appetites and overeating is productive of ill effects. Milk is the principal diet until they are two months old. From then until maturity, green vegetation, leaves, twigs, bark and roots of trees, with rolled oats and bread, offer a rich and variable ration for the healthy, husky creatures.

Houses should be provided. A plank or log structure, four feet square, with a hole in the bottom and a door in the rear, will suffice. It is perched at the edge of a pond with the bottom barely touching the surface of the water. A metal trapdoor, opened and closed with an iron rod from the outside, may be fitted over the water hole when the beavers are to be imprisoned. When retained in this house for 24 hours before being released, one can be assured that the beavers will use this artificial domicile regularly. Young as well as old beavers are fond of bread, rolled oats and cracked corn. The effect of a variety of foods on the quality of the fur has not been determined. Contemplating the domestication of beavers as a source of fur, the Bureau of Biological Survey has estimated that 640 acres of good aspen land (aspen being a natural food) will afford sustenance for 1,000 beavers indefinitely.

The beaver family is widely distributed, occupying the streams of the major portion of the continent of North America—from the mouths of the Rio Grande and Colorado rivers, and Northern Florida north to Labrador, Alaska, and the mouth of the Mackenzie River, well within the Arctic Circle. Variable climatic conditions have been conducive to the growth of a variety of species. The southern shore of Lake Superior is productive of the richest skin.

Pistol Protection Versus Pistol Prohibition

Concluded from page 12

every one of these criminals owns and carries his pistol in defiance of an already existing law which provides severe punishment for the ownership and carriage of a pistol without a permit. How would these unlawfully held pistols and revolvers be gathered up? No one with any intelligence will maintain that the criminals would come forward and surrender their arms, or throw them away, just because one more law had been passed. Who would confiscate these weapons? It would require an enormously increased police force and an enormous expense even to attempt it, and the attempt could never be more than partly successful. A law on the books that is not enforced gets about as far as an automobile with an empty gasoline tank.

The bootleg gun, smuggled through our ports or the Mexican or Canadian borders, would be a ready means of supply to the man who wanted a gun. It would add another criminal profession to our already large list due to such laws. The gun is an easy commodity to smuggle by the customs officials, much easier than bottled goods. Once in, the revolver is not a thing that can be used but once; it can be used over and over again by the same individual or be sold to another who needs it in his crooked occupations. It would be impossible to increase our customs force sufficiently to make the law effective.

There are any number of gunsmiths in this country who would soon be rich, making guns for the criminal class. The rifle can easily be converted into a weapon that is almost as easily concealed as the pistol.

Such facts show that a law prohibiting the private ownership of pistols and revolvers is not only impracticable, but actually an evil thing in itself, however laudible its purpose. It would actually be an evil, a most dangerous thing, for the law-respecting, honest citizen, who would be faced with the alternatives of either keeping his pistol in defiance of the law (thereby becoming a technical criminal himself) which many would undoubtedly do, or else of turning his pistol in to the authorities and thereby leaving himself that much the more at the mercy of the still armed criminal.

In all this discussion we must not lose sight of the fact that there is still a large part of this country of ours which has little or no police protection, still scores of millions of our people who, when attacked or threatened by burglar, highwayman, thug or criminal of any kind, must depend upon *themselves* for defense or suffer loss or injury or even death.

Aside from the impossibility of making such a law work, there comes up the problem that the "law-passer" has given us—just where are we going to stop in our restrictions of the private acts of the individual? In answer to this question, hundreds of thousands of American citizens are especially emphatic in their statements. They ask why their personal liberties should be restricted by a law that is utterly foolish and could only result in harm. Men who never carry a gun object strongly to such a law, merely on the principle that the liberty of the individual has already been curtailed to too great an extent. They quote in support of their argument the specific guaranty in the Constitution—"the right to keep and bear arms shall not be infringed upon."

Debts and Slave Girls Cause Tong Wars

Concluded from page 7

were easy victims in the rice fields, truck gardens and rural shops.

The Peace Society was now organized to arbitrate and prevent tong wars. All the tong chiefs were called into their council chamber under guaranteed protection. The police, tired of the long arguments, locked the whole crowd up in the Six Companies building until they should reach an agreement. Outside crowds gathered and listened for 36 hours to the debate within before lasting peace was again proclaimed.

Then six hours later a Hip Sing clothier was shot and a Hop Sing jailed. So the war of "Three to One" continued until all, nearly exhausted financially, came to terms some months later.

Since that time wars have been more frequent although usually of shorter duration, and three or four "lasting and final" peace treaties have been recorded each year.

At best thousands on thousands of dollars are lost every year when from 500 to 1,000 men find it suddenly necessary to leave their employment; close up their little shops and laundries, or thrust their business affairs into some friendly hands for an indefinite period while they seek safety in other cities, or stay hidden in their rooms. Last year in the Sacramento River Valley, the abandoned asparagus crop of the Chinese farmers represented a loss of more than $2,000,000.

Yet, suffer as they do from each other's depredations, never will they call on the American police for protection, or in any way aid the authorities to detect the crime of another Chinese. Enemies among themselves, all stand firmly united to baffle our police. As witnesses they are purposely dumb.

Furthermore, Chinese whose business demands contact with Americans will rarely admit their tong membership, and very firmly voice their disapproval of the organizations. Yet they frequently act as hosts to gatherings of prominent Americans. The following paragraphs are quoted from the San Francisco *Call*:

"Membership in a Chinese tong has its uncomfortable moments. Edward F. Dunne, former mayor of Chicago and former governor of Illinois, discovered this Monday night, when policemen raided a party given in his honor at the Hip Sing Tong and carried away one of his fellow guests, a pretty Chinese girl, clad in wonderful silks, in the belief that she had been sold into slavery to a member of the tong.

"But Mrs. Dunne was present, and many prominent citizens from San Jose, and the slave girl proved to be no slave girl at all, and so the 'rescue' only supplied a startling climax to the after-dinner entertainment."

Don't think that only the lowly, poor, and ignorant criminal classes comprise the tong memberships. Just three years ago Look Tin Eli, American-born and self-made, the president of the China Mail Steamship Company, and his directors embezzled nearly $2,000,000 of the company's money in the buying and reconditioning of the steamer *Congress*, now the *Nanking*. Look Tin Eli was held responsible by the stockholders, who wanted a division of the spoils. Warned by a tong paid to do their bidding, Look Tin Eli went into hiding with the probable intention of compromising with hired blackmailers later on, but he dallied too long. One director was shot, and he was marked second on the list.

Barricaded for Weeks

WILD with fear he rented the entire top floor of a down-town hotel and barricaded himself within for some weeks. For his family's benefit he tried to insure his life with the New York Life Insurance Company. Insurance companies are agreed that the Chinese is a poor risk under any circumstances for two reasons—health and tong bullets. Hence only very restricted insurance policies are sold to them, short-time, paid-up, endowment policies. But Look Tin Eli, hiding in the Plaza Hotel, they wouldn't consider.

His tong, the Hop Sings, came to his defense. Although he could count on their loyalty, life for him was most uncertain. He never again would be safe in this country. So some months later, disguised as a sick old woman, he was secretly taken in an ambulance to a tug boat, which carried him outside San Francisco harbor and put him aboard the steamer *China*. Shortly after he died in China, literally scared to death.

The troubles of the poorer families do not receive such sensational press notices as did Look Tin Eli. At the outbreak of a war all the tong members are mysteriously and suddenly whisked out of sight, and during their enforced absence provided for by their tong. Their wives and children also receive small amounts of food supplies. These mothers are accustomed to hardest labor always, and are usually capable of managing their husbands' little shops. One woman whom I met was a rather expert tinsmith, and carried on the little business in the husband's absence, only laying off one day while her fifth baby was born.

"They are not nervous," says an American woman physician who has practiced among them for many years, "or supposed to have feelings at all. They don't have clubs or scarcely any social intercourse. Occasionally they attend banquets with their husbands when they are left to themselves in the small back dining room while their husbands, each one with a pretty young guest, sit at the main banquet table. Oh, yes, they do experience emotion. Why, I've known cases when wives at the outbreak of a war have had their husbands jailed on some pretext or another to get them into a really safe place till the war was over."

Nevertheless it was a Chinese woman, Madam Chong Tse Sing, who a few weeks ago implored the Suey Sings to let her husband's death go unavenged. Here's the story as Sergeant Mannion told it:

"On June 30, Chong Sing, rich shrimp merchant, president of the highbinder Suey Sings and member of the Benevolent and Protective Four Families Association, went with a companion to a new shrimp fishing camp in San Francisco Bay. They demanded $100, claiming this amount as the new camp's share in legal expenses incurred some 10 years previous in a fight against certain legislation regarding methods of shrimp fishing. At least so the proprietor of the new camp claimed later in court. Chong Sing's companion declared they had gone to collect rent for the fishing rights in that part of the bay used by the new company. They had no right to do either.

"Chong Sing was killed in the quarrel which followed his demand.

"Immediately the Four Families Association, the widowed Mrs. Chong, and the Suey Sings put in their claims with the Chinese General Peace Association against the murderer and his tong, the On Yicks. Sufficient money payment will always end a quarrel before it begins, and recompense any broken-hearted parent or family for the loss of a loved one. But this time the grief-stricken little Mrs. Chong was more than anxious to settle at once and for a very small sum, knowing that to be the surest way to avert a probably long and bloody tong war. For a slain chief does not go unavenged. So she went to her husband's tong.

"'It is given to men to make wars and fight them,' she said, 'but it is the women who pay the price in bereavement. Do not rob more children and wives of their fathers and husbands. Please, I ask for peace instead of revenge.'

A Police Ultimatum

"BUT the Suey Sings and the Four Families were greedy in their grief and held out in the councils for a large sum, the Suey Sings answering, 'He was your husband, we grant, but he was our president. The murderer must pay or we will fight till he is forced to.' Although she finally won over the Four Families Association, it was not until the indemnity was raised to $8,500 that the Suey Sings grudgingly consented to sign the peace agreement. It was rumored widely that the widow and the Four Families had secretly agreed to give the Suey Sings most of the money, and that they feared the Suey Sings, not quite sincere, would soon start more trouble with the Four Families. And that's why I took their treaty," ended Sergeant Mannion.

Concerned with both Chinese and American welfare, he had stepped into the council chamber of the General Peace Association during the signing of this latest peace treaty, and,

"Gentlemen of the Tongs," he said, "you have signed and sealed this treaty. Now I am going to take the document with me under promise that it shall not be opened until warfare again breaks out among you. And if any one is killed, every one whose name appears on these articles will be held in connection with the murder."

Such is the latest definite action taken against tong criminality in the United States.

Since many representative Chinese and Americans assured me that fully 90 per cent of the Chinese tong members sincerely wished the vicious, dangerous side of tongs abolished, I inquired how they would solve the problem. Both Sergeant Mannion and O. P. Stidger, attorney and counsel for the San Francisco Chinese Chamber of Commerce, replied, "Amended Federal laws to facilitate quick deportation of Chinese criminals. They fear nothing so much as deportation, which means certain death on arrival in China."

At present it is both costly and extremely tedious to deport a Chinese criminal. The fight to convict and deport Wong Doo King, one-time chief of the Bing Kongs, dragged through the courts for years, costing the government about $50,000 and the Bing Kongs at least $30,000 more before he was finally deported five years ago.

Like the Chinese Chamber of Commerce, the Chinese Welfare Society, whose purpose is the reception and care of their people in this country, is powerless and afraid of the tongs. Their very earnest secretary answered:

"I could tell you much about the workings of the Six Companies and the Peace Society in their relation to tong troubles, but, frankly, I do not dare. I'd gladly give my life to stop these wars if that would help. With more honorable men in charge, I think we Chinese could handle the situation ourselves."

At the Peace Society, after ascending the long flights of stairs to their top-floor offices in their red-brick building, I found four old men deliberating earnestly over a domino game. One of them shuffled over to greet me at the door with, "We do not speak your language." And he quietly and firmly closed the door in my face.

The practical results of this organization can be read any day on the bulletin boards in Chinatown. At Grant avenue and Clay street, the long turkey red placards with painted black characters, were translated as follows:

"We wish to say that Wu On belongs to no tong other than our family association, so please exempt him from harm." Signed and sealed by the Jung Ying Association and the San Francisco General Peace Association.

"To announce that Yue Noon came from the Toy San district; that he was formerly a tong man; that, as a tong man, he has found it too difficult to earn his living; for which reason he wishes to pay his dues and to resign from his tong. He has so registered at the Peace Society, which orders that he will hereafter be exempt from harm during war." Signed and sealed by the San Francisco General Peace Association.

"One of our members, Mr. Lee Lau, from the Toy San district, has done good business since he came here. But now people on the street are saying he belongs to a highbinder tong; that they are surprised and will no longer patronize him. We know for certain that he belongs to the Four Families Association and to the Native Sons, and besides these to no other tong. We beg for his personal safety." Signed and sealed by the Four Families Association.

Ways That Never Work

"CHAN FUN, of 671 Clay street, came to the Chinese Consulate and declared that he had been a member of the Suey Sing Tong, but because of so much fighting he could not care for his family. He has now resigned from that organization with clear record, and will no longer pay for their protection. We demand safety for him." Signed and sealed by the Chinese Consulate.

Such announcements in English would make one rub his eyes and pinch himself to see if he really wasn't dreaming. Yet hundreds of Americans pass there daily with only a casual glance at the stooped old men, and the dapper young ones who stand reading them. And further, be it remembered, Clay street and Grant avenue are only four short blocks from the heart of San Francisco's financial center.

The Hop Sing attorney, American and prosperous, says, "Let them alone. You misjudge them. They're not nearly so bad as people seem to think."

Ng Poon Chew, with gentle good humor, replies, "We know lots of ways but they never work, you see. Too lenient American law enforcement, perhaps, and too clever American criminal lawyers."

Industry's Use of the Intelligence Test

Concluded from page 10

history of experimentation, checking of results and verification.

"The test with opposites for words, for example, is close to 25 years old and has a record of uniformly high correlation with demonstrated intelligence. The test in supplying omitted words in sentences and paragraphs has a still longer record of undoubted value. The use of speed tests with easy tasks is not a caprice of the psychologist, but is justified by abundant proof that the person who can do harder tasks can do easy ones quickly."

What are the tests like? Take the Otis tests used on the clerical workers as representative. There are numerous questions like those referred to by Professor Thorndike, others on family relationships, as to the alphabet, varied numerical and arithmetical questions intended to stimulate quick thinking, a series of proverbs to which the subject is asked to relate the proper paraphrase from another series, jumbled words from which sentences are to be formed and questions as to similarity of geometrical figures or the number of cubes in a group which call for careful observation and ready analysis.

Then among the more striking questions are these:

Pitcher is to milk as (?) is to flowers, the answer to be selected from these words—stem, leaves, water, vase, roots.

Which is most like these, axe, knife, shears?—Razor, hammer, hoe, rake, fork.

It is safest to judge a man's character by his (?)—voice, clothes, deeds, wealth, profile.

Gold is more costly than silver because it is (?)—heavier, yellower, scarcer, more malleable, prettier.

Congress is to United States as (?) is to city—mayor, council, city attorney, president, citizens.

Physics is to motion as (?) is to blood—temperature, body, veins, physiology, geography.

A mother is always (?) than her daughter—wiser, homelier, kinder, older, taller.

Revolution is to evolution as explosion is to (?)—plants, world, volcano, crumbling, war.

It cannot be pretended that the last three are easy, however one may find the others.

While this indicates their general character, naturally there is wide variety in these tests. One much used for superior adult is made up of three questions, of which the examined must answer two correctly.

1. Draw the path of a cannonball fired from a level cannon across a level field.

2. If a bucket of water weighs 45 pounds and a 5-pound fish is put in the water, what will the whole weigh?

(If the answer is "fifty pounds," the examiner may say, "How can that be since the water holds up the fish?" and it takes quick and clear thinking not to become rattled.)

3. With a rifle which carries perfectly 100 yards, is it any harder to hit a quart can at 100 yards than 50 yards?

A word from Dr. Link on the use of intelligence tests in industry: "The relation of employment psychology to labor and industry is an impersonal one. Like all other science, it is impartial, merely an instrument, a method, which will serve without favor whoever makes use of it.

"If industry wishes to obtain the best possible kind of human material, to make the best possible use of its workers, to maintain a reliable check on its classification of them, employment psychology is at its disposal.

"On the other hand, if organized labor wishes to carry out collective bargaining, to base its claims for individuals on the sound basis of ability and training, employment psychology provides it with a technique which will enable it to classify properly its collection of workers for that purpose."

And there is this to add: According as we in America fit the worker to the job, to that extent we shall reduce the vast economic waste which now springs from unscientific methods. In money this is conservatively estimated at *seventy billion dollars every year.*

A Suppressed Biblical Social Standard

What "Koinonia" Meant in the Early Church; and How It Was Interpreted Out of the Bible; the Original Social Principle of the Christian Community

By DR. DU BOIS H. LOUX

WHEN I had made my discovery of the suppression, I went to my *alma mater,* Union Seminary, New York, and sought Professor George Albert Coe, a scholar who stands abreast of the times.

No, he had not been free to go into the field of my discovery. But he recommended that Professor Ernest Findlay Scott of the seminary be sounded.

Dr. Scott had this to say almost on the shot: "If you will go into the library of the seminary and ask for a certain book reserved on my shelf for my classes, you will find a parallel to your discovery. The book is edited by B. H. Streeter, of England, and consists of a number of articles by himself and others, published by the Macmillan Company under the title, 'The Spirit.' Professor C. Anderson Scott, New Testament head at Westminster College, Cambridge University, England, has an article, 'What Happened at Pentecost.' That's the article that will interest you."

They let me take the book home, with the understanding that if I stayed up all night with it, it surely would be back by morning for the students who might require it.

"What Happened at Pentecost:"—Well, that was the occasion which had started me on the road to the present findings. I mention the fact, because it is a matter of history that discoveries very often reach distant minds at logically identical points, although to different conclusions.

We shall not, I think, come to Dr. C. Anderson Scott's main conclusion, when the facts are now unrolled before us; but it will bear repeating, that it was what happened at Pentecost that started the present writer into the field of discovery. And on this wise.

Were Not Communists

ROBERT HUNTER, the author of *Poverty,* has a recent book, also published by the Macmillans, called "Why We Fail as Christians." I am acquainted with Hunter, and admire him for his sincerity and painstaking, though we draw different sociological conclusions from present conditions and history. Notwithstanding that we differ, I felt sorry for him in his book, that he was not possessed of the facts to which every trustful scholar is entitled. He was writing with the confidence that an accurate translation of the New Testament was in his hands. Rather marvelous to say, his finger too was *upon what happened at Pentecost.* He was quoting from the second and fourth chapters of the book of the Acts, and was using a great run of italics. Here, he set forth in his italics, are two places where it is said that the early Christians had all things in common. That is why they succeeded where we fail. The early Christians were communists.

Now the early Christians were not communists. Hunter is wrong.

But the point to be made is that he had nobody to help him to the facts, the facts which the present writer had chanced to come upon. Instead of two places in these two chapters in the Acts on which he had his finger, there is an important verse: (2:42) where, unknown to him, the communication, "they had all things common," is crowded into a single, cogent, now hidden expression. Had Hunter known this, undoubtedly it would have flared into his page of italics quite thus: "There were added to them in that day about three thousand souls. And they continued steadfastly in the apostles' teaching *and the communism."*

The word which Mr. Hunter calls "communism," and which escaped him at the point most vital to his thesis because it is translated "fellowship" in both the AV and the RV English and American translations, is the word *"koinonia."*

While I repeat that this word does not contain the idea known as communism, I must be frank to give you the exact measurement of its value in present-day Near East Greek. It is possible to do this for the registrar and interpreter of the district court of Nicosia, Cyprus, A. Kyriakides, has provided us with a *Modern Greek-English Dictionary* of terms as they now have meaning in the Near East.

Basic Principle of Society

FOR the noun koinonia the meanings *society, community, communion, sacrament* are noted; for the adjective, koinós, *common, common sense;* for the verb koinoneo, *to be in common with;* for koinostemosune, *community of goods, socialism;* for koinologia, *sociology;* for koinoergos, *working in common;* for koinobiakós, *cenobitic, monastic;* for koino demos, *public;* for koinophelés, *common utility;* for koinooismós, *socialism, communism.*

Now were you to have your Greek New Testament before you, in the presence of the article *the* before koinonia (Acts 2:42), which requires us to say *the* koinonia, it might occur to you from the above definitions that the expressions "public policy," "business sense," "laws for the common good," "doctrine of the general welfare," "practical working basis," "program for the perfectly efficient commonwealth," and the like, always with the "the" prefixed, might do for the outset of our inquiry.

Certainly the considerations, that a society was on the threshold possessed of the determination that none of its members should be driven to a condition of need (Acts 2:45); or be found lacking in life's essentials, (4:34); or hold the property right for selfish advantage (4:32); or barter gladness and singleness of heart for a lame prosperity (2:46); or crowd all of the day's vigorous hours into the getting of gain (2:46); or crush one single high ideal (2:17); or forget the sufferings yet the triumph of Jesus of Nazareth, the founder of the society (2:22-24); or do violence to any of "the ways of life" made known to Jesus by God (2:28); or fail to make an enemy of any enemy of the common good (2:35), must be included in our estimate of the value of the expression, "the koinonia."

There was never any communism like that. Communism waits with every member of the group continuing to hold his selfish advantage, until by some means the world is worn down to the acceptance of its theory. The *koinonia* starts with a Christ who became poor at once, though he was rich, not to wear down men to the station he assumed, but to make himself most efficient to lift the whole society together to ever higher levels. (2 Cor. 8:9; Phil. 2:1-9.)

As soon as the koinonia was a fact, the basis of principles upon which it was founded, enabled the apostles to find a place for rich men; whereas Jesus was required to demand the unloading of the riches. (Matt. 19:21 with 1 Tim. 6:17^{ff}.)

This in itself means that the expression "the koinonia" was unfurled to denote the advance of the new society founded by Jesus precisely to conform to the standard of Deuteronomy which we considered in the article on Interest in the Bible. The society went at once to the basis: THERE SHALL BE NO POOR WITH THEE, FOR JEHOVAH WILL SURELY BLESS THEE . . . . IF ONLY THOU DILIGENTLY HEARKEN UNTO THE VOICE OF JEHOVAH THY GOD, TO OBSERVE TO DO ACCORDING TO ALL THE COMMANDMENT WHICH I COMMAND THEE THIS DAY. (15:4-5.)

The sweeping straight to this Deuteronomic basis, to which Jesus went at the outset (Matt. 5:17-20), is what happened at Pentecost.

Having said this, prior to examining the evidence for the statement, I do not think that you will be led to Dr. C. Anderson Scott's conclusion in his article in "The Spirit." Asking what we may suppose should happen, were we to pray seriously for a second Pentecostal outpouring of the Spirit, this is Dr. Scott's solemn word: "Judging by the analogy of Pentecost, we should have to be prepared for consequences that might be described as revolutionary in thought or in organization . . . . Even the doctrine of private property went up in the flame." (*The Spirit,* p. 153.)

Holds Dr. Scott Is Wrong

NO, LET it be said before we enter upon our discoveries, not that. Not the *property right* fed to the flame. Dr. Scott, scholar that he is, and deeply respected on your side of the waters and on our side, is wrong. We are not upon a voyage bound upon a far-flung sea of revolution. The reverse is the case. We are upon the thrilling waves of evolution—the fairest, noblest waves of the evolution of moral and spiritual principles, upon which alone a permanent civilization dares venture.

Jesus' method was not to find talk and discourse on the commandments. Esteeming them priceless in value and abundantly able to take care of themselves (Matt. 5:17-20), he passed at once to the work of creating a society which would commend itself to the end of the world, and to the ends of the world, as a society which would make the breaking of the commandments useless.

What astounds us is the fact that the translators should have suppressed the phrase, *the koinonia,* which constitutes the standard, that is, the weight or measure of the entire complex of the New Testament happenings. Were the suppression of this standard limited to the Acts, the culpability might be perhaps less inexcusable. But Mr. Hunter would have been the most amazed man in the world, were he to have been put in possession of the fact that the word he most wanted was suppressed and hidden away under different terms in tens of places in the New Testament.

All of our versions, English and American, keep back from our intelligence that the great kingdom building *koinonia* word occurs over and over again, in passages most precious to civilization, without the slightest indication in the translations of its momentous presence.

It seems to me that one would as well want to tamper with weights and measures, and still be accounted honest, as to want to tamper with koinonia, to keep it out of the balance, lest it prove overweighty in the scales of modern opinion. As the world is ruled by opinion, nothing has more served oppression, nothing has been more conducive to poverty since the time of James I of England, than the keeping of the knowledge of the suppression of the presence of *the koinonia* in the New Testament from the ken of the people.

So saying, we are ready to begin to look at the tens of places where civilization has been wronged by this suppression.

We should begin, I think, with Paul's word to the point given to Timothy. Here the *koinonia* word, had it not been suppressed, would have won us numberless examples of social efficiency engineers raised up in gratitude to the genius and work of Jesus Christ. These are Paul's words:

> "Charge them that are rich in this present age, that they be not highminded, nor have their hope set on the uncertainty of riches, but on God, who giveth us richly all things to enjoy; that they do good, that they be rich in good works, that they be ready to distribute, willing to be *koinonikós;* laying up in store for themselves a good foundation against the time to come, that they may lay hold on the life which is life indeed." (1 Tim. 6:17^{ff}.)

In reading this passage in our Bibles, we are in absolute ignorance of the fact that Paul is carrying us back to what happened at Pentecost.

"Willing to be *koinonikos,"* he says. How?

Answer is given in the New Testament, but in every instance the fact has been suppressed in the translations.

First of all, *koinonikos* with respect to the affairs of the practical life. There was to be no administration of the affairs of the Christian community that admitted of sin. *Otherwise it would have turned the koinonia into a koinonia of sin.* (Rev. 18:4). Christ's prayer taught his disciples (Matt. 6:12) this practical duty: "release us our debts as we release our debtors." This petition obligated the disciples to put the law of Deuteronomy 15:2 into effect, "Every interest-taker that lendeth ought unto his neighbor at interest shall release it; he shall not exact interest of his neighbor." *Not* to have released the forbidden interest-debt would have been a *koinonia* with sin. (1 Tim. 5:22). No one could be entertained as a church member who refused to abide by the light of the koinonia teachings. (2 John 9:11).

Koinonia Abolished Slavery

"TO HAVE done otherwise would have been equivalent to turn the *"koinonia* of righteousness" into a koinonia of unrighteousness. (2 Cor. 6:14). "And what *koinonia* hath light with darkness? And what concord hath Christ with Belial? or what part hath he that believeth with an infidel?" (vs. 15). Therefore the practice of the *koinonia* would stand in proof of the separateness of the church from all evil practices. (vs. 17. Eph. 5:11). By establishing itself as a community in which *poverty could not raise its head* (Acts 2:41-47; 4:31-34), the church became *"koinonia* of the divine nature." (2 Pet. 1:4).

This insured a lively faith on the part of the church members. (Rom. 11:17). They became *"koinonia"* both of the things of the spirit and the things of the material life. This meant that they could not fail to have *koinonia* "of every good thing." (Phile. 6). If in the *koinonia* they gave, in the *koinonia* they freely received. (Phil. 2:11; 1:7; 2:1-4). This made the Christian irresistible. *In business affairs as in religious affairs* his "singleness of *koinonia"* stood out. (2 Cor. 9).

The *koinonia* was given and received by a simple clasp of the hand. But great authority for the kingdom of righteousness went with it. All nations and peoples were included in the prospective benefits of the *koinonia.* (Gal. 2:9).

The world respected, feared God, was taught of God, through the koinonia. (Acts 2:42-43).

Nowhere within the koinonia is there to be lack. (Acts 4:34).

Slavery, in what respect soever it may be conceived, is abolished in the koinonia. (Phile. 17). The effectual pleading of love, united with the fact that the koinonia is vibrative and actualized, is irresistible in the breaking of the bands of slavery. "If thou count me therefore koinonikos, receive him as myself."

The Holy Spirit began the koinonia at Pentecost. To pray for Pentecost is to pray for the upbuilding of the koinonia through the Spirit. *"The grace of the Lord Jesus Christ, and the love of God, and the koinonia of the Holy Spirit be with you all."* (2 Cor. 13:14).

Passages Were Withheld

DID these men fathom the heart of Christ correctly when they called themselves the *koinonoi* of Christ, rather than *Christians?* Do you know that Paul never calls himself a Christian? that John the beloved disciple never calls himself a Christian? that none of the disciples calls himself a Christian, that the word Christian occurs but three times in the New Testament, while the suppressed word fond to the hearts of the apostles, the *koinonia* word of Pentecost, occurs over and over again in the writings of the apostles?

The legalist who takes the parables used by Jesus to depict the ravages and consequence of interest that goes on to the Judgment, thence to say, "Christ set aside the law against interest," can get on very satisfactorily so long as the facts of the *koinonia* are suppressed.

This because Jesus chose the method of the vibrative society.

Peter, Jude, Paul and John show that there were Judaizing influences at work, even as they builded the society, and that these influences threatened the civilization of the future. (Jude 4, 11, 16, 17, 18; Rev. 2:9; 2 Pet. 2:1^{ff}; 2 Tim. 3:1^{ff}; 4:3^{ff}.)

These influences culminate in the act of withholding the *koinonia* passages from the understanding of the people.

Suppress the standard, substitute words of different weight and content: after that any oppression is possible, and even in the name of God.

Conversely, restore the standard—give back the koinonia truth to the people: it will shine in its own light. "Ye shall know the truth, and the truth shall make you free." (John 8:32.)

BRIEFLY TOLD

Stickers of animals will adorn the windshields of automobiles entering any of the 12 national parks. These stickers are designed with animals native to each particular park and are issued by the Department of the Interior.

During the last year $500,000 was expended on construction of graveled roads in Alaska, most of the work being done on the Glacier National Highway.

R. K. Atkinson, of the Russell Sage Foundation, says, "We are rapidly becoming a nation of bleacherites, because we have too much temptation and too much encouragement to be passive participants in recreation—to listen, and watch, and not perform. And all the while, we are piling up emotional stimulus, and repressing it."

Badgers live in the chalk cliffs of the British Isles and destroy much game while foraging at night. Badger-hunting, or digging, is a novel sport, for it entails following the badger into its lair deep in the ground. Extensive galleries with many ramifications are revealed in the chalk cliffs where for thousands of years the animals have been burrowing and excavating the soil.

The heavy gypsy earrings of the latest fashion in London are stretching the ears of women who wear them into triangular shapes, and permanently disfiguring them. Some of the earrings weigh four ounces. Paris women are wearing earrings attached to their hats or evening headdresses.

The World Prohibition and Reform Federation is an organization formed by the merging of the International Reform Bureau and the World Prohibition Federation. It was announced that the aims of the federation were "to add to the happiness of America and to develop such an understanding between the nations of the earth that as a result the whole world might be educated to the co-operative task of eliminating all causes that produce misunderstandings and result in wars."

Tractors are replacing the dog sledge trains in the spring rush to the Yukon this year. The first tractor train, consisting of a 10-ton hauler with three trailers, was made up at White Horse recently for the 300-mile trip to Mayo. Tractors are also being pressed into service to carry ore from the Keno Hill silver mines to Mayo landing.

The newly organized Chicago Civic Theater Association plans to establish and maintain a theater wherein plays of the highest standard and significance may be performed by artists who are recognized as having ability and reputation. Free performances will be given Saturday afternoons with a classic play for the public school children of Chicago. A library of drama and art literature, to be known as the Actors' Library, will be maintained in connection with the organization.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

The treasures of the Boston Museum of Fine Arts are guarded each night by two giant police dogs who are trained to refuse to accompany anyone but the watchman who has charge of them. At intervals each night they are led through the darkened galleries. All employes have been cautioned against remaining in the building after hours because of the danger of attack by the powerful canines. But for the intervention of the watchman recently, an official of the museum, who stayed until late in the evening, would have been torn to pieces.

The Chicago Motor Club has a fleet of motor cycle riders who pick up broken glass on the streets when they receive a call.

Because he had no money a young Canadian from Alberta, 18 years of age, was turned back at the American side of the international bridge in Niagara Falls, New York. He then climbed to the network of steel girders beneath the bridge and walked across the Niagara River, 150 feet above the water on an iron beam 12 inches wide. Thousands of tourists viewed the rash act and customs officers again escorted him back to Canada.

Our national wild life resources, if capitalized on the basis of a six per cent annual income, are worth more than $1,000,000,000.

Italy plans to develop 75 per cent of her available water power within a year. All sources of water power are to be linked up so that when water is scarce in the north in winter the power can be conveyed from Central Italy, and in the summer when the water is scarce in the central part of Italy the power can be obtained from the Alpine streams of the north.

The Caspian Sea is 84 feet below sea level.

A roof over the Chicago River 10 miles in length, carrying boulevards, parks, garages and oil-filling stations, has been proposed as the solution of Chicago's traffic problem. The roof would be 200 feet wide, of nine-inch concrete supported on concrete piling sunk into the river bed. On the roof would be two sidewalks, 15 feet wide; two boulevards, 50 feet wide, and a vacant space in the center, 70 feet wide. The proposed plan would not interfere with river traffic as it would be constructed from 20 to 30 feet above the surface of the water.

To eliminate the unintelligible calling of railroad stations by hoarse-voiced passenger train conductors, a device in Prague automatically displays electric-illuminated signs in cars just before the arrival at each station.

There are 42 persons drawing pensions for the War of 1812. All these pensioners are women. Hiram Cronk, of Ava, New York, was the last soldier actually on the rolls of that war. He died in 1905.

Due to the fall in the value of the mark, cash registers are now useless in Germany.

A miniature engine, whose power was generated by the rays of the sun, was successfully demonstrated in an eastern college recently. A parabolic copper mirror focused the rays upon a test tube of water, the heat caused the steam which in turn operated the tiny motor at a high rate of speed.

Kensington Square, in London, dating from the days of William III, is threatened by a commercial invasion. To provide a garage for commercial vehicles, it is proposed to raze one of the old houses on the north side. Addison, Steele, Talleyrand and John Stuart Mill are numbered among the prominent personages that at one time lived in this charming spot. Distinguished artists and others are protesting against the step which would irretrievably damage the historic square.

Certain students at the Johns Hopkins Medical School are paying their tuition with blood money, literally speaking. They sell their blood for transfusion purposes at $50 a transfusion. The subject must be perfectly healthy and his blood must measure up to a certain standard before he is eligible for bleeding.

PROPAGANDA OR FACTS?

The world today is flooded with propaganda. There is a scarcity of facts. Pick up a magazine or newspaper and glance through it. Aside from local news—how much dependable information do you find?

That is why Henry Ford established

The Dearborn Independent—The Ford International Weekly

A non-partisan, non-sectarian weekly magazine, devoted to printing facts—a chronicler of the neglected truth.

Any Ford Dealer will gladly accept subscriptions or they may be sent direct, using the blank below.

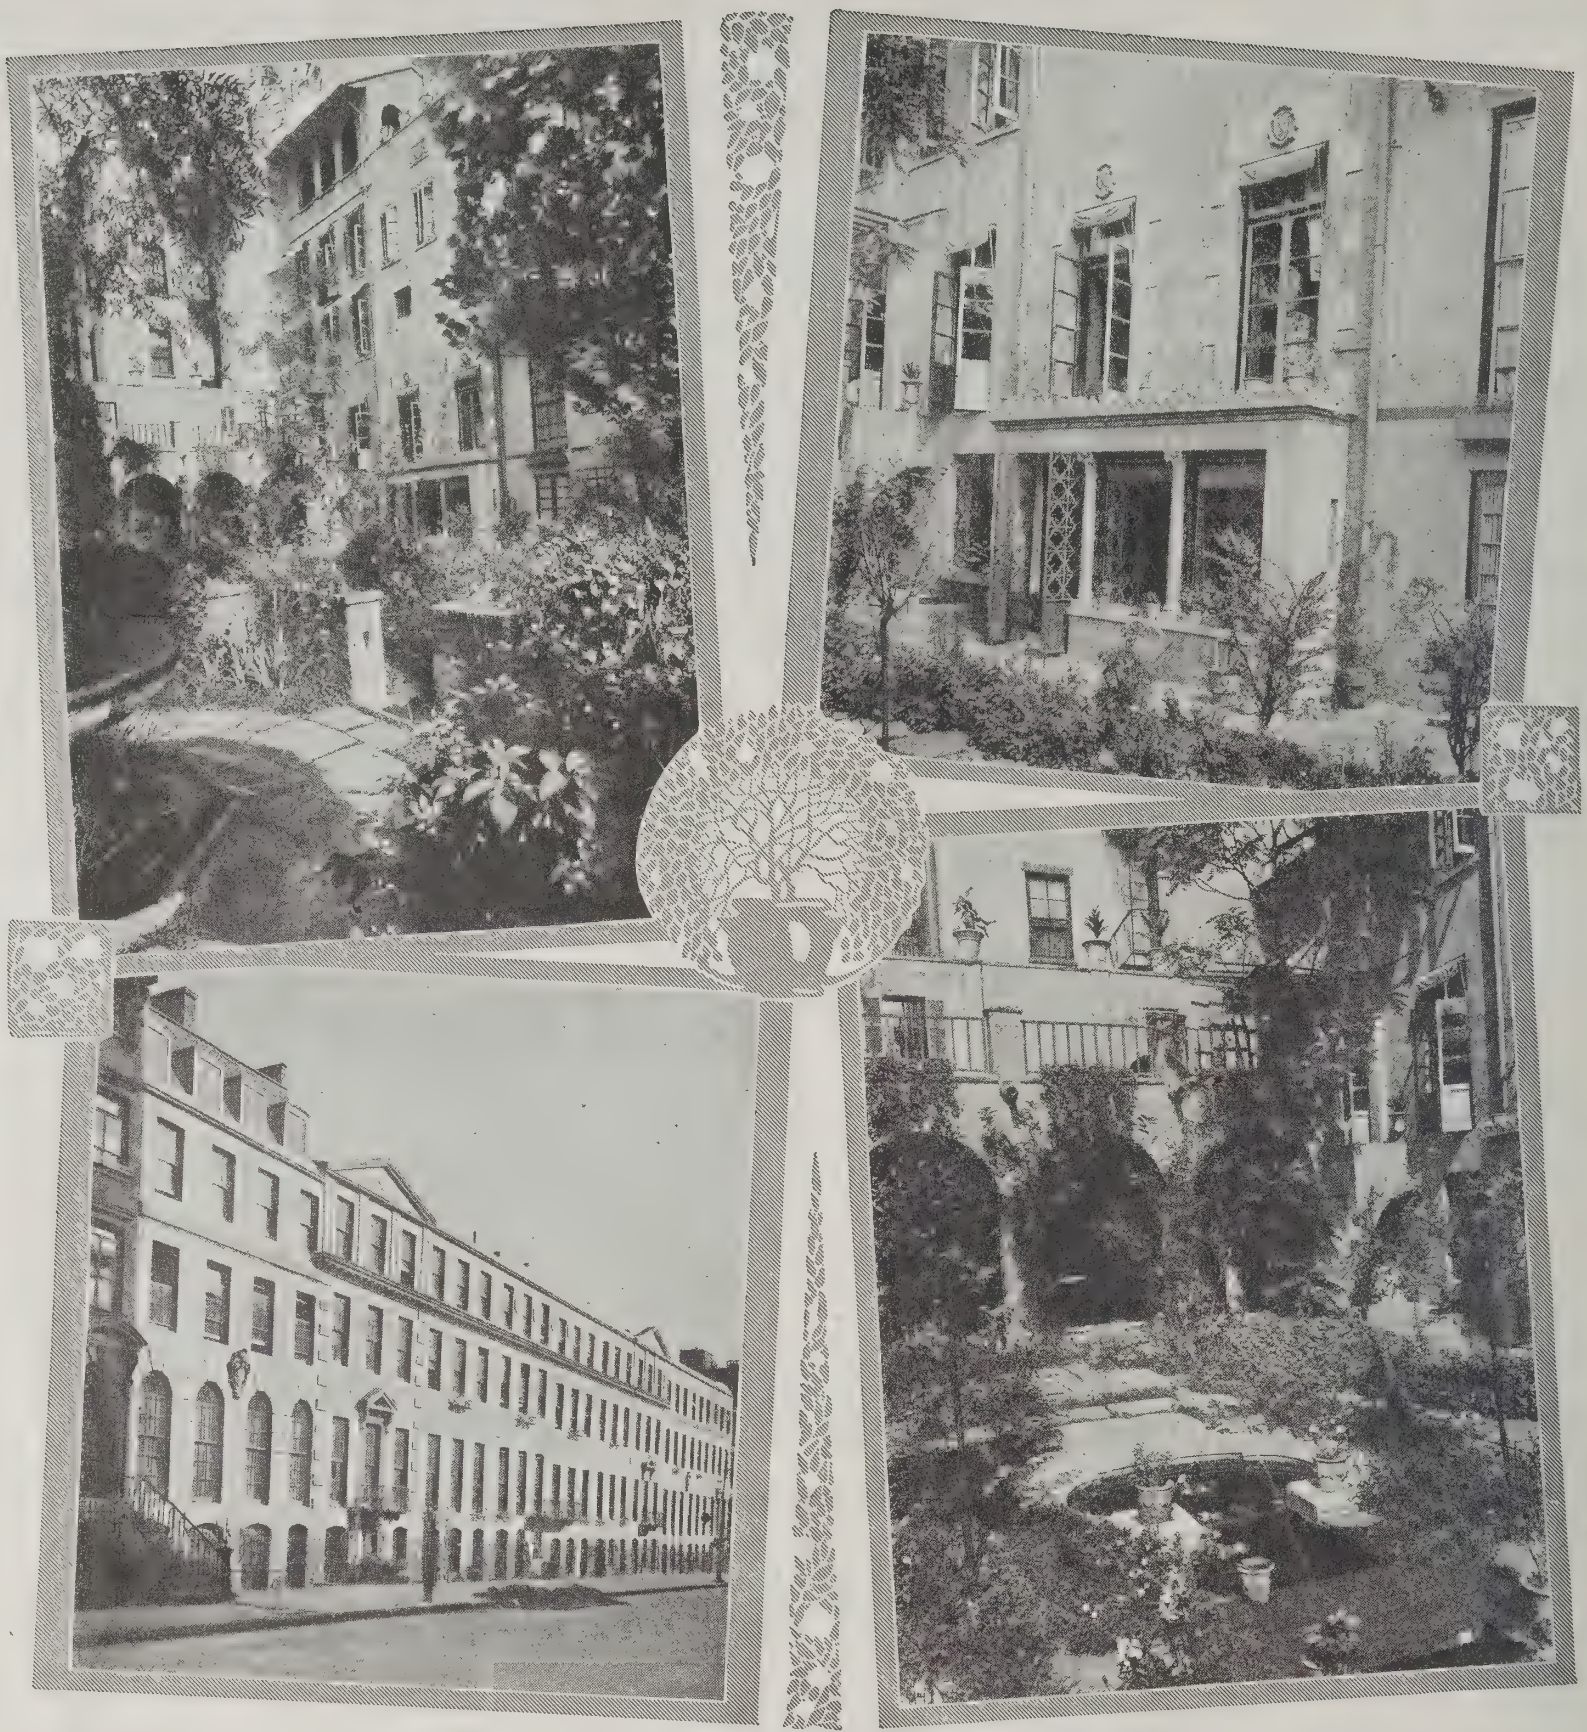
CHRONICLER OF THE NEGLECTED TRUTH



The folk who live in Turtle Bay Gardens have transformed the back yards into a fairyland unlike anything known elsewhere.

Making Houses Reversible

Showing the Way to a Greater Community Life

By ALBERT WOOD, A. I. A.

THE average city block in most large cities is a little island surrounded by noisy, dusty streets. Socially, it means nothing. It is like a circle of folks holding hands but standing back to back. It is difficult to be neighborly with the island folks across the street; the traffic prevents that, but with the people on your own little island, a real enjoyable community life is easily within reach if they will only turn around and face each other. And turn your houses around, too, for we are going to show you how easy it really is.

Do not just put on a front. Put on a back, too! Of course we realize that the view toward the back yard may not be pleasant or friendly—it seldom is—there are the ash cans, family wash, neighborhood cats, ugly board fences dividing off the space into damp little checkerboard-like squares. To help you realize the possibilities that linger in that dismal back yard view, let us introduce you to the Turtle Bay Gardens, New York City—the back yard that is different. Yesterday this spot was "No man's land": today it nestles near the heart of a great city like an oasis in a desert of brown stone fronts. Yesterday a space without form or function—today a veritable jewel of a garden, sparkling in the sun.

Turtle Bay Gardens, a quiet and contented little community, charming and quaint in its hide-away exclusiveness, is merely two rows of houses on Forty-eighth and Forty-ninth streets, New York City, that decided to get together for their mutual benefit and enjoyment.

Each home stands on a lot about 20 feet wide by 100 feet long and their 20 little back yards have been transformed into such a charming community garden that we wonder why they were not built that way in the first place.

Some say this is the age of organization (perhaps just the beginning of such an age would be a better guess). However, a collection of persons does not become society until it is organic. Only when we have that urge to get together with our neighbors and organize our unrelated activities, do we really begin to achieve great things.

A pile of bricks does not make a building; it takes a plan and organized effort to do that. And 20 uninteresting, useless little back yards can only become a beautiful garden spot by organized effort. Each contributed a part—of not much value by itself—and in return received a beautiful whole. In 1760 the property herein illustrated was part of the old Turtle Bay Farm and Turtle Bay Creek ran near by. Hence the name which has been given this development. The rear of the houses has been altered to accommodate the living and dining rooms, and the kitchen has been moved up front where the parlor used to be. Now, the milkman delivers the milk on the front steps which seems to suit everyone much better.

Instead of being awakened by the honk of the auto horn, the call of the birds reminds us that the day has begun. While at breakfast we can commune a while with Nature before plunging into the business life of the city. At evening time we may enjoy the cool and shade and perhaps the fountain in our charming little garden—with not a reminder that the throbbing city is just a hundred feet away.

This large garden has been designed with such skill that we not only enjoy the view of the entire space inclosed but have the privacy of our own little garden also. The individual gardens are marked off by low balustrades, or low iron fences of good design, sometimes with gates. The low walls are vine-covered and serve as a background for flowers and shrubs. Here and there a fountain has been placed—always in just the proper place to enhance the charm and beauty of the whole scheme.

The general plan is simple, yet there is a wealth of individual planting and detail from the interesting pots of different design to the beautiful balustrades and detail of the loggias seen at the rear of some of the houses. The walks are mostly stones laid irregularly with grass growing up between. The few trees have been made the most of so that they may be enjoyed by all. The path where the alley is usually found is common property of all.

He Wanted Cartridges, Got Warship and War

Misinterpreted Message From Newspaperman in Cuba Brought "Maine" to Havana and Conflict With Spain as Result of Her Destruction

Above—WALTER SCOTT MERIWETHER.
Below—The wreck of the U. S. S. Maine.

By C. E. COLLINS

MOST histories used in the schools say that the battleship *Maine* was sent to Havana "as an intimation that the Americans in Cuba would be protected by their government."

The *Maine* was not sent to Havana as a warning to Spain. It was sent there because of a misinterpreted cable message which a newspaper correspondent in Havana sent to his paper in New York. All that the correspondent wanted was a box of cartridges. A battleship was sent instead. It was blown up in Havana harbor, war with Spain resulted and a new page was added to America's war history.

The man who sent the ill-fated message was John R. Caldwell, now dead, then a correspondent at Havana for the New York *Herald*. Because of conditions in Cuba, the Spanish had established a censorship. The *Herald* and its Havana correspondent made use of a private code.

Caldwell, nervous over the ill feeling in Havana, sought to arm himself and he had his paper send him a revolver from New York, the sale of arms being banned in Havana. The revolver came without ammunition. Caldwell decided to cable for it but it was necessary that he send a message that would pass the censors. So he wrote:

"Camera arrived but no plates. Please hurry by next steamer.

"John R. Caldwell."

An assistant cable editor received the message. He knew nothing of the sending of the revolver. The full name, "John R. Caldwell," by a previous understanding, meant that the message contained more than the words signified. With aid of the code book he deciphered the message to mean that the American consulate in Havana had been attacked. Official Washington was quickly informed and by midnight the battleship *Maine* was under orders to proceed immediately to Havana. She reached there January 24, 1898. On February 14, she was sent to the bottom with two officers, and 250 men killed outright, eight wounded so severely that they died afterward and all but 16 of the remainder of the crew maimed and hurt.

That, in brief, is the story I have from Walter Scott Meriwether. Meriwether was in Havana when the *Maine* was mined, was a bosom companion of Caldwell and was, moreover, correspondent for the very newspaper to which Caldwell had sent his innocent message. He now is owner and editor of a weekly newspaper in his boyhood home, Charleston, Mississippi, and it was from a sketch in his paper, the *Mississippi Sun,* written soon after he became the publisher, that I got an inkling of the secret which he had nursed for almost a quarter of a century, doubtless the only man who has the complete details.

War correspondents taken at Key West immediately prior to the declaration of war with Spain. Walter Scott Meriwether, whose account of the destruction of the Maine is here given, is shown seated in the second chair to the right, nearest center.

Meriwether stands high in the estimate of his fellow townsmen. Some of the old residents remember his family and a few remain who knew him 40 years ago before he left home to seek fame and fortune. Everyone around Charleston speaks of him with greatest respect.

But such a story!

How had it been kept secret, and why, for a quarter of a century? Who is this man now able to contribute such a revealing chapter to history? I wanted to know, so I made inquiry.

Soon after leaving his Mississippi home, Meriwether joined the United States Navy and saw 10 years of service. Afterward he got into newspaper work and he has devoted the remainder of his life to it. Most of the time he was with New York papers. For the New York *Times* he went to Labrador to meet Peary when word filtered through that the explorer was returning with the story of the discovery of the North Pole. Fresh from this assignment, he was ordered to accompany Admiral Kimball and a regiment of Marines sailing on the *Yankee* for Nicaragua to oust Zelaya. He reported the sinking of the *Maine* for the New York *Herald* and was the first to get through to America the great news story that Americans were on tiptoe to hear—that the *Maine* had been sent down by an exterior explosion.

"The correspondent who sent the cablegram from Havana to New York causing the *Maine* to be ordered to Havana, was one of my most valued and closest friends," said Mr. Meriwether. "Under seal of confidence he told me the entire story. He had planned to write it himself but thought it inadvisable to do so until some years had intervened. I asked and obtained his permission to make a passing reference to it in an article I wrote years ago describing the scenes in Havana on the night the *Maine* was destroyed but I was fearful of spoiling his story and the reference attracted little or no attention. More with the idea of serving my friend with data than with employing it myself, I had, as opportunity served, asked the several actors in the drama, each of whom I intimately knew, the parts they had played. Then the man for whom the notes were intended came back to the States from Havana, where he was long the Associated Press correspondent, and suddenly died. I felt that his death released the story to me but just at that time I was plunged into war work as publicity manager for the Shipping Board and later with my retirement to my old home, the episode was forgotten.

"It was early in February, 1898, that I received orders from my newspaper, the New York *Herald,* to go to Havana and relieve John R. Caldwell, who was then in charge of the *Herald's* bureau there. Caldwell was a bright fellow and an exceedingly capable newspaperman but for some reason he had come into disfavor with the then owner of the *Herald*, the late James Gordon Bennett, who had cabled from Paris a curt order to make the change.

"It was anything but an interesting place to be just then. Ill feeling between the Americans and Spaniards had been displayed several times and riots were frequent between the Cubans and the Spaniards. An order had been issued forbidding the sale of arms and ammunition. Caldwell was required to be on the streets a great deal and he decided that it would be wisdom to arm himself. Consequently he wrote to Fred Burgin, cable editor of the *Herald,* to send him a revolver. Burgin did so, but he neglected to send cartridges with it. Caldwell could no more buy shells than he could buy a revolver. So he resorted to the cable.

"At that time there was a censorship in force, exercised by the Spanish. Because of it, the *Herald* and its Havana correspondent made frequent use of a private code. Without taking the trouble, however, to write a code message, Caldwell, realizing that Burgin would know what he wanted, sent the message in the following words:

"'Camera arrived but no plates. Please hurry by next steamer.

"'John R. Caldwell.'

"It so happened that the cable editor was home sick when the message came clicking into the *Herald* office that night. A young assistant was on the desk. He caught the significance of the full name, 'John R. Caldwell,' and realized at once that Caldwell was saying more than the mere words indicated and that the office would have to puzzle it out. Had Burgin received the message he quickly would have understood that Caldwell had received the revolver but no cartridges. But Spain's Nemesis was about that night. The assistant turned to the code book and transcribed the message to mean that the American consulate in Havana had been attacked.

"Fireworks ensued. An attack on the American consulate in Havana meant only one thing. It was the spark to set off the long brewing trouble between America and Spain.

"The message had come in at 9:30 o'clock. The cable office in Havana closed at 9 o'clock. There was no possible way of getting further news nor of communicating with Caldwell that night.

"The *Herald* got its Washington bureau by telephone and directed that every available man be hustled out on the story. The first move was to communicate with John D. Long, then Secretary of the Navy. He was informed of the contents of the message. Instantly official Washington was in a furor. Rapid telephonic conferences took place with the State Department and the White House. By 11 o'clock orders had been promulgated directing Rear Admiral Montgomery Sicard, commanding the North Atlantic Fleet, to detach a vessel from his command, then at anchor off Dry Tortugas, and send it to Havana forthwith, the reason given being that an eminently trustworthy correspondent of an important newspaper had cabled the report of an attack upon the American consulate.

"The message was relayed from the Key West naval station by torpedo boat to the *New York,* flagship of the fleet.

"I recall talking with Captain Sigsbee of the *Maine* some years after the war and he described the midnight visit to the *New York* where he was summoned by Admiral Sicard. His orders were terse. The *Maine* was to proceed at once to Havana. Everything was left to its commander's judgment, the admiral not hampering him with definite instructions.

"Fires were spread under the boilers of the *Maine,* awnings and stanchions were taken below and the decks were cleared for action. Soon the pride of the American Navy was on her way to the troubled waters.

"Things were happening for Caldwell in Havana. He was in his room at the Inglaterra Hotel when a message came the next morning from the *Herald*:

"'Rush story you bulletined on Cuban cane crop—we want it for main section!'

"Realizing that he had sent no story of the Cuban cane crop, Caldwell got out the code book. The first part of the message conveyed the tidings that, 'A United States man-of-war has been ordered to Havana.' He was puzzled a moment over the remaining words for there was nothing in the code that even slightly resembled it. Then it flashed on him that the use of the words 'main section' was to tell him the name of the vessel that was coming, otherwise the *Maine*.

"Caldwell was excited. His first impulse was to find the consul general. Fitzhugh Lee, former Confederate general, then was in that position at Havana and he occupied quarters immediately across the hall from Caldwell. Caldwell met him in the hallway.

"'The Battleship *Maine,*' he exclaimed, 'is on her way to Havana.'

"'Impossible,' exclaimed General Lee. 'The government would not send a warship here unless I asked for it and that I have not done.'

You May Watch It Grow

YOU may traverse two thousand years in two weeks by going from London to Egypt. You may traverse at least 75 years by the simple method of reading the current issue of any London daily. For they have what they call "a prohibition fight" over there, and any American who is curious to know how and why prohibition comes need only read a London daily. Lady Astor, born and bred in America, has introduced a bill which has caused all the trouble. It is a very simple bill. It is as far from "prohibition," in the popular sense of the word, as anything could be. It is such a bill as the "wets" of any other country would campaign for, and do it gladly. The bill merely makes it illegal to serve liquor to children in saloons, for consumption within the saloon. Just that. In England the tots of the poorer quarters run with their pennies to saloons as American tots run to the candy stores, and Lady Astor, seeing the pity of it, presented a bill making it illegal to sell drinks to children. The bill does not interfere with the ancient boozy institution of "rushing the growler," not for a minute. Children may still be sent on errands to carry beer or gin or whisky to their parents. But as for frequenting the saloon itself, licking up drinks and otherwise showing oneself sophisticated, Lady Astor thinks that the age of 18 is quite early enough to begin that.

But to hear the Lords and Commons rave, one would think that "British fair play," which is the over-sea equivalent for "personal liberty," were greatly in danger. All the eloquence, all the logic, all the prestige and all the politics of the highest quarters were mobilized to denounce this perfectly sane proposition. Oh, if Dickens were only here to see Church and State in England fighting for the rights of children to infest the saloon!

But here's the point: it is precisely what occurred in the United States less than 40 years ago. The movement to make an age limit for saloon frequenters was so bitterly fought in the United States that it really formed the public opinion out of which all subsequent prohibition effort came. Decent people were so astounded at the spirit shown by "the traffic" in the case of child patrons, that an oath was registered to do away with it, and thus it came to pass. The history of prohibition is written entirely in the gross stupidity of the "business." And it would appear that, unprofiting by the past, the public houses of England are about to repeat every mistake the American saloon made. The "business" has no Pussyfoot to guide it.

Florida and the Tabert Case

THE State of Florida is undergoing a discipline which is all for the good of that state's good name. If it were not that Florida had become the second home of hundreds of thousands of people in all parts of the United States, the present exposure of the brutal excesses of the practice of peonage would probably not have attracted such widespread attention. As it is, the Tabert case has become a national case, and has been conducted in a spirit which must commend itself to all just minds.

It is a striking illustration of the unity of the United States that the fate of a North Dakota lad should be the means of recalling the State of Florida to a sense of duty in a forgotten matter. But more striking still was the interchange of memorials between the legislature of North Dakota and the legislature of Florida, in both of which the same spirit of justice and humanity was expressed. It is to the honor of the Florida legislature that no false sense of state pride was permitted to blur its view of the facts. And now by Florida's own act the whole bad matter of peonage is being opened up and it may fall to Martin Tabert, a North Dakota lad, to have been, through his death, the means of blotting out the inhuman practice.

The fact of the matter is this: no man is good enough to be given absolute control over another man's body. No camp boss, no whipping boss, no warden, no employer, no official, no king is good enough to have the last word of weal or woe for another. No county, acting for society in the restraint of a man's liberty, has the right to sell that man into the service of a private person who, under the authority of the state, may do what he will with him. We blame Congress for delegating its constitutional financial powers to a group of bankers; but the same neglect of duty goes all down the line and reaches its horrible end in peonage. A prisoner of society has his rights and one of them is the protection that should be accorded him by society.

It is safe to say that but for peonage the crime of vagrancy in Florida would not appear in such high ratio. Where an industry depends in any degree on convict labor, steps will be taken by interested men to provide the convicts. And many of the men thus taken will not be convict stuff, which will lead to such tragedies as that of Martin Tabert. Florida is not infested by vagrants as the vagrancy reports would indicate. But the necessity of supplying convict labor is likely to stamp as a vagrant any young man who is out seeing the country, and who for the moment happens to be without funds.

It will be a sad day for our country when young men shall no longer take their "wander year" and see the land. The spirit of the "journeyman" still survives, happily, in the older stock. And if perchance a northern lad, hearing of the fame of Florida, wanders thither, look twice at him before putting the stamp on him as a tramp; and when a Florida lad strikes North to see what like the country is, they know him there as soon as they hear him speak—for the soft speech of the South wins welcome there, even though it be on the lips of a young man whose principal business for the present is not the making of money.

Why Don't the English Move?

BY FAR the worst feature of the unemployment situation in England is the false light in which unemployed persons are viewed. The newspapers speak of them as if they were alien folk, some strange sort of humanity whose plight is to be regarded as an infringement on the public peace. And this in England of all places where the unemployed are not "foreigners" but are English bred and born, and in a painfully large majority ex-soldiers! That is the danger of viewing any "class" through the newspapers. The picture is never true to life and of course the opinions formed thereon are apt to mislead into wrong judgments. Moreover it leads to the making of class divisions where none naturally exist. The people looked down upon are compelled to think in class fashion of the people who do the looking down. The fact is, unemployment and poverty give less reason than does any other circumstance in life for the fortunate to look down upon the unfortunate. If there is anything that should not make a difference between men it is the fortune they have in times of economic distress. The man out of a job may be a better man than the man in a job—unemployment is not a criterion of character judgment.

When the unemployed of England try to call attention to their most sorrowful plight, there is a tendency to call them Bolsheviks. Surely there is nothing Bolshevistic about the desire to earn a living. Surely it is the very essence of anti-Bolshevism, the desire to leave government doles and begin at honest labor.

England is presenting the world with a strange spectacle of incompetency in handling the distress of her own people. She is utterly wearing down the splendid spirit of that people to whom the world owes much. The worst thing she could do is what she is doing, and the best thing she could do now is to start strong emigration movements and rid England of a very large part of the population. This economic pressure is too great to justify the retention of so large a number of people in distress simply to have them on hand for further exploitation in the underpaid industries of England when the time of prosperity returns. Let the people swarm out into the wider and happier spaces of the Empire and relieve the pressure on the "tight little island." As compared with Ireland, economically, England is "a most distressful country." Economic pressure moved the Irish out into happier opportunities throughout the world; why should it not be permitted to do as much for the English?

Bidding Early for 1924

THE early appearance of the politicians crying their 1924 political wares is proof that they have at last recognized the growing indifference of the public. The old-timers hope by a long running start to overcome the public inertia. Hence we have the spectacle of a Presidential campaign being started at the halfway post of a Presidential administration. And we have also the spectacle of a number of men boldly and immodestly making early bids for the highest place. The hawking and auctioning and political elbowing have continued so long that the Presidency is suffering, the very idea of Government is suffering; a degraded shuffle of place-seeking is driving the honor away.

It is to be said in President Harding's behalf that he resents these efforts being made in his name. Not only is it the unseemliness of the embryo campaign that repels him, but also his lack of interest in it. He is not by any means sure that he wishes to be President for another term, although he is quite certain that he does not wish to be a one-termer after the style of Mr. Taft. Taft was beaten. Mr. Taft is a lame duck—the first of Mr. Harding's long list of defeated statesmen who have been given positions. Mr. Harding does not wish to be beaten. He would probably not take any appointive position if he were. And if it looks like a defeat he may not run. The argument now most potent with him, namely, that he owes it to his party to run, is wearing thin in his mind. Who is his party? Where is his party? He is surrounded by a group of men who know exactly what they want, but who have not always been able to get it; not one of them ever comes to the help of the President, they all want something from him, and those who have been disappointed are no longer his "friends." The point which Warren G. Harding's mind will privately reach in due time is this: he owes nothing to his party except his being precipitated into a position that has never fitted him and of which he would gladly be free. If he runs and takes a defeat, the "party" (not the rank and file, but the official managers) will "blame it on to Harding." Harding does not want that. He does not deserve it. His mind is not made up. The attempt to pledge him in advance is distasteful to him. Moreover, it is a sign of Ichabod above the Presidency.

Mr. Harding is not deceived, in his private mind. He knows what schemes are twined around his office and the Government. But they are so many, and the forces behind them are so powerful, that Mr. Harding feels himself beaten before he starts. Somehow he has never felt beneath him and behind him the sustaining spirit of the American people. He looks abroad and sees where he might strike, and then remembers that all the things which the American people are taught to think are under the control of the very forces at which he would strike. He looks over toward the Treasury and sees there as visionless a money-broker as ever sat in a counting house; he looks at his party (the managers) and sees it intent only on the next election; he looks at the press and realizes with a pang that even his State Papers are ruthlessly edited by third assistant telegraph editors all over the land; he looks at the people and knows in his heart that they instinctively distrust Washington. And so he feels beaten before he starts. And when he looks over toward Congress, he finds the good and able men unorganized, and the rule of reaction strongly entrenched.

Besides, and this is the worst, he himself does not know what to do. We believe that if he knew, he would try to do it. There have been moments when he was almost on the point of denouncing the wrong that has crept up around the seats of authority at Washington. But the fear of indulging only in spectacular futility has driven him to silence again.

It is a rather hopeless picture. But not so hopeless as it seems. There comes a time when the impotency of a Government means nothing—the burden simply slides over to the people, and they bear it. After all, the people are the foundation and the structure. When a Government ceases to serve, it simply ceases to count. It is unfortunate but it is not fatal. It was out of the people that Governments and Presidents came to begin with, and the people can put forth new Governments and Presidents again. Washington would be a mighty fact if Washington were serving. Serving itself, Washington simply becomes more and more a non-entity and the vast dignity of the people becomes more and more apparent.

That is the meaning which even the politicians are beginning to grasp, as shown by their over-early campaigning: they see a new public spirit rising, which their parties could not give and cannot take away.

Mr. Ford's Page

THE organization of industry to serve the people will not interfere with the profitableness of industry, as some seem to imagine. Indeed, the entrance of right principle into our economic life will not decrease wealth, but increase it. The world as a whole is much poorer than it ought to be, because it has muddled along on one cylinder—the "get" cylinder—and has not grasped in any practical way the true law of service and increase. Thus we have on one side all the practical ability and initiative, and on the other all the religion and idealism. The two halves have never come together because the one has not been idealistic enough and the other has not been practical enough. Their very antipathy is evidence that they represent an unnatural breach. The healing of the breach will come from the practical side.

But when we talk about service in business, it is a very narrow conception that arises. We think it means only with reference to the commodity which is made and sold. Well, if the principle of service should get even that far it would be a great step, but it would by no means represent the whole length of the road which we have to travel. If, as things are now, without any new development, the idea of service were to rule—if houses were built to endure and not merely to sell, if clothes were made to stand wear and tear and not merely to please the eye of the purchaser, if all forms of adulteration and substitution and misrepresentation were to vanish, there is no computing the good that would accrue to the world through the economic balancing up that would immediately follow. The whole burden of paying the earnings of our honest labor for dishonest product would be lifted, and every section of humanity would feel the relief.

> *IN CONSIDERING industry as a service to society, do not forget that what is called "service" today is only the a b c of the matter. The thought is usually confined to service in the production of commodities by honest methods out of honest material at honest prices. That is all right. In itself it would be a big step in advance. But there is more beyond. The shops themselves will become service stations. They will become the guarantors and conservators and distributors of the domestic fuel supply through a process of mine ownership and coal coking. They will become public utility concerns by tying their surplus power into municipal transportation and lighting during the night. Industry will be hooked up, through its machinery, with the most intimate service to the people.*

But having done that, the service of industry to the economic problem would not be wholly fulfilled. Useful as our industries have been, it is becoming apparent how wasteful they have been. We have corrected in some degree the waste in men; there has come of recent years a new sense of responsibility for the producer. But the great waste in material goes on, and, of course, waste of material is waste of men, because all material is the result of human labor.

Industry owes it to society, as a part of its contribution to the new order, to conserve material in every possible way. Not only for the element of cost in the manufactured article, although that is important, but mostly for the conservation of those materials whose production and transportation are laying an increasing burden on society.

As it is now, every manufacturing concern exists to make the article it is most interested in—clothing, furniture, vehicles, books—whatever it may be. It has not been linked up with the community any closer than the furnishing of jobs and the general participation in business.

But it is apparent that manufacturing concerns of size could be much more useful to the community than that, for example, in the matter of supplying fuel and power. Under the system now practiced, coal hauled to a factory remains there. Deliver a thousand cars of coal to the shops of a great manufacturing district, and that is the end of them. In times of "coal shortage," the job of keeping the factories supplied with fuel and the job of keeping the homes supplied with fuel are two distinct jobs, requiring two great supplies of coal.

Now, it is possible in any great manufacturing center that the coal used for power in the factories could also be used for heating the homes of the people. That is, it is possible to use every piece of coal twice—once for its industrial uses and once for its domestic uses. A car of coal delivered at a factory could be used to do all that is required by the factory; the chemicals, gases, tars and other ingredients could be extracted, and the remaining coke, a pure fuel, could be sent on to the homes.

This has been done with great success and economy. It is no longer an experiment. For several winters it has been demonstrated on a large scale that not only can the coal be used twice, but that the coke can profitably be sold at exactly one-half of the charge made by the trade.

This is one of the benefits which have come to the people by reason of the wholly inexcusable mishandling of the coal trade. Instead of making their product easy to get (as good business men always strive to do) the coal controllers made their product hard to get, so they could charge more for it, and as a consequence they drove thinking people to devise ways and means of neutralizing the shortage. The result will be beneficial. Had coal always been easy to get, these new methods would hardly have found foothold, because humanity seldom takes a step forward without being pressed to do so.

With all the great manufactories coking their coal, thus providing a double use for it, other economies will come. A great waste will be prevented. When one thinks of the precious elements which have been consumed for decades on the furnace grates, all going up in smoke and being lost to human use, it becomes clear that the new method has not come too soon. Not only are the elements of coal being saved in modernized manufactories, and numerous other fields of endeavor enriched by the materials thus saved, but we are coming to see that our factories may become public service institutions in a degree not conceived as possible until now.

In the modern use of coal, gas is produced, and gas is a public utility. That part of the gas which is not used in direct processes of manufacture can be turned over to the community. The fertilizing elements extracted from coal can be utilized on the farms. The coke can be used, and is being used, for domestic consumption at greatly reduced cost to the consumer.

And then there is the possible effect of all this on the transportation problem. As our great factories go into these economies which really consist in getting greater usage out of their basic materials, they will come more and more to the use of power in its electrical form. Now, in our great cities electricity is used in lighting and transportation—these are its greatest services outside the factories. The multitudes of our cities are transported on electric cars to and from work. When the men are in the shops, the peak load is on the lines that furnish the factories with power. When the men are going to and from work, the peak load is on the lines which operate the transportation systems. That is, when the men are not in the shop they are on the cars. And nothing is simpler than that the factories, before and after working hours, should turn their power over to the work of transportation.

These are only passing hints, all of them practicable and most of them already in practice, by which the industries of the nation can be of greater service to the community. Our great factories have it in their power to become public utilities in a larger sense than ever before. During the last "coal shortage" it was necessary, so our rulers thought, to distinguish between public utilities and ordinary industry. Every industry that employs men is a public utility. It is the greatest act of public inutility to close down industry. But under our present wasteful system it was thought necessary. It is apparent now how there would be no distinction if coal were utilized to its full value, because the operation of industry would be essential to the domestic fuel supply and for the operation of public service; and such interdependence would constitute a chain which would make necessary the uninterrupted daily supply of all, which in turn would mean uninterrupted employment and prosperity.

A volume of 346 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Burdening Community With 'Watered' Homes

"Extra" Edge Taken by Each Person Involved Is Added to Buyer's Bill

By AARON HARDY ULM

This is the second article by Mr. Ulm on this subject.

"WE ALL are headed the wrong way," declared one of the biggest builders of homes in the country to the real estate brokers and the builders of his city about two years ago.

"We are working against our own future interests and are loading upon the community unnecessary burdens which may prove disastrous.

"Let's get back to old principles. The public is crying for small, economical houses; we are building only large ones and are putting into them a lot of tomfoolery that is worth nothing to purchasers. We are wasting a lot of money in advertising and in other sales cost and in financing sales, when the right kind of houses would sell and finance themselves. For every dollar we get we are delivering only about 75 cents worth of real house, even after allowing fully for increases in cost of materials and labor. Let's be honest with ourselves and the community and do what we can to stop this inflation. We know how much real costs are above those of pre-war times. Let's put out houses that will sell for prices that contain no other increases; that is to say, let's build so that we can deliver a dollar's worth of housing for every dollar we get from or obligate purchasers to pay."

"It can't be done," the others declared.

"I'll prove by actual operations that it can be done," the speaker replied.

Took $500 Profit on Each

SO HE immediately put his organization to work erecting two groups of small houses, one brick, the other frame. They were of the type that in 1913 or 1914 would have sold in that community for from $3,500 to $4,500. The brick dwellings were offered the public for $7,500 each, the frame ones for $5,900. Before they were completed, more than a score of ready would-be purchasers were begging for each of the houses.

"I made $500 net profit on each of them," says the builder. "I had to spend not a dollar in selling them. The selling cost of the average house built in this community during the last two years has averaged 10 per cent or more of the sales price. The 'financing' of those houses cost only about $300 as against from $750 to $2,000 for the average house marketed here during the last several years. As I put no gingerbread work into them, the purchasers received real house for every dollar they put into them. With the average house sold in recent years from five to 20 per cent of the cost has been in refinements put in merely for their worth as 'selling talk.'"

But there is a sequel to the builder's experimental adventure in non-"watered" housing. Nearly every house which he built has been resold at prices running from $2,000 to $3,000 above the prices he received. As this is written one of them is advertised for sale at $11,000!

Therefore, most of them are loaded down now with just as much "water" as any builder would have put into them at the beginning. Virtually all that "water" is covered by the customary second and third mortgage notes that have passed into the hands of "note shavers" who procured them at discounts ranging from 20 to 50 per cent. Present occupants of many of the houses are paying interest on the "water" at its full face value and, at the risk of losing all they are putting into the purchase of the properties, they ultimately must redeem that "water" in full.

If Others Had Helped—!

"THEREFORE, I rendered no service to the community," says the builder who made the experiment. "If other builders had followed me we could have saved the public millions of dollars and made good profits for ourselves. But they wouldn't follow me; probably, in the case of those who have to operate largely on borrowed funds, they couldn't follow me. If I had been in position to erect 1,000 such houses, I could have saved the situation. But I couldn't do that; so I returned to the 'easiest way' followed by other builders. The result is that inflation has been piled upon inflation everywhere in the building trades and those others, like the materials industries, from which they draw. Although it would cost me more perhaps than any other person in the country, I'd be glad to see the public go on a 'buyers' strike' insofar as houses are concerned."

Take another case, of which the writer is authoritatively informed. In an eastern city there is a large apartment house which when erected about 12 years ago cost, for land, construction and "financing," about $500,000. Within the last two years it was sold for $1,050,000. The purchasers gave the former owners a first mortgage on the property for $850,000 of the purchase price and $200,000 in cash. They went into the realm of "note shaving" and by paying down a "fee" of $50,000 floated a second mortgage on the property for the sum of $300,000. This left them with $50,000 cash profit on the transaction with whatever additional "equity" they can realize through increased rentals. So far they have realized on an "equity" of several hundred thousand dollars, for the tenants of the apartment house find that they would have to pay like rents for similar accommodations elsewhere. If a reaction should come and wipe out the present "owners'" aqueous "equity" the property merely would revert to holders of the second mortgage. The operators still would be gainers.

There is a man in the East who, representing wealthy interests, claims to have made $30,000,000 for his clients by operations of that kind during the last four years.

Take what the writer is reliably informed happens in a certain mid-western state where "blue sky" laws ostensibly apply to such financing, especially when mortgages are covered by bonds distributed among general, and often small, investors. There a property may be bonded up to 70 per cent of its "appraised value."

A builder buys a lot for $50,000. He arranges to erect an apartment house to cost him $100,000. But he manages to have the lot appraised at $100,000, the structure as outlined in the plans at $200,000, a total of $300,000. Then he goes to a large "financing" concern which does that kind of business and procures a loan of 70 per cent or $221,000. He allows the concern a commission of from 15 to 25 per cent, which when deducted from the loan leaves him cash in hand of approximately $170,000 to $190,000, in any event a sum equal to or above his actual outlay. The "financing" concern sells to the public bonds covering the loan at full face value, or $221,000. The builder fills up the house with tenants who pay rent on a $300,000 value basis and then finds it easy to sell his "equity" for a sum ranging from $40,000 to $60,000. **The only person that suffers is the renter, who bears all the varying rake-offs and inflations taken from and added to the property.**

Conspicuous in that kind of transactions are the Jewish real estate operators and the Jewish-controlled financing concerns. While, as a rule, they go further than others they are by no means the only ones who have profited immensely in that way on account of the house shortage condition existing throughout the country since the war. In nearly every eastern city one can find Jews, who, though often only a few years from the ghettos of Europe, have become landlords on immense scale by varying kinds of application of the method described above. Even before the war they made millions by it, although not so easily as in recent years. As pointed out recently by Burton J. Hendrick in *World's Work* they often begin large-scale real estate operations on less than "shoe strings."

Rentals That Mean Nothing

RENTS and large commissions on loans supply the basis and secret of such operations. Even during the pre-war period of plentiful housing, it was never difficult to procure loans on apartment and tenement property in ratio to returns actually received in the form of rental charges. Occupants for property on rental bases justifying the loans often were procured through means partaking mildly of "bribery." They would be given inducements by way of "free" rent for the first month or two, or "free" moving, or otherwise, to get them to sign leases based on high monthly charges. But during recent years, on account of the scarcity of living quarters, it has been unnecessary thus to "bribe" the renter. However, recently in some communities apparent "concessions" have been offered in return for signing leases that run for from two to three years. And there are cases of inflated property having been thus disposed of for the future so well that, no matter what happens by way of reduction in the house shortage and lowering of general values, the operators in the property haven't a chance of losing. For they will earn enough from the long-term leases to offset any thinning of their "equities."

They are even more secure where the property, like houses, are sold to the occupants on terms of small cash payments down, the balance to be paid in monthly installments. There the seller has what amounts to a lifetime lease from the occupant. It is of little importance to the original operator, however, for he usually "gets out from under" by selling the occupant's notes to some "note-shaving" individual or concern.

Thus, the biggest problems of the housing situation go back to money and the peculiar ways, under certain conditions, thereof.

John G. Williams, of Philadelphia, speaking for the National Association of Real Estate Boards before a Congressional committee, didn't hesitate to declare that the "financing" of construction was the most difficult and burdensome factor in the housing shortage situation. Asked if the cost of construction as measured by prices for materials and labor had not been the greatest retarding factor, Mr. Williams replied:

"That has today a whole lot to do with it, but when you consider the little money that you can borrow and what you have to pay, in many cases, bonuses costing probably 12 to 14 per cent—I am speaking conservatively—you can imagine just what item of cost that would add to the entire bill. . . . We could not get the money unless we went out and paid these unusual bonuses . . . . We cannot get the money unless we pay a high rate for it; and when we pay a high rate, of course, we go out and let a contract with the material man and the iron man, and we find they have paid a high rate for their money, and, of course, they will charge that much more for their commodities."

Excess charges for housing money have not been made only by individual "note shavers" and the mortgage investment concerns which "make no bones" about levying all the traffic will bear. It was brought out by the Lockwood Committee in New York that respectable savings banks and highly reputed insurance companies often do the same thing. Many ways are utilized for getting around laws which may forbid exorbitant charges in such cases. One way is to place the loan through a broker who exacts an excessive fee which he splits with the lending concern.

The Lockwood Committee, for example, found that a savings bank in Syracuse, New York, permitted a broker to charge a commission of 14 per cent on a loan of $250,000. Out of the $35,000 thus received ostensibly by the broker $20,000 went back to the bank. The borrower received only $215,000 in cash but gave a six per cent mortgage on property for $250,000. Thus interest had to be paid on $35,000 which was not received and which also had to be paid, together with the $215,000, at the expiration of the loan. This "water," you safely may bet, was loaded on to those who rented the property.

Other banks that hesitated to exact exorbitant commissions in cash often required the borrower, it was found, to accept large parts of loans in securities at par value when said securities could be marketed for cash only at prices 10 to 15 per cent below par.

Working Off "Dead Stuff"

ANOTHER method of making exactions, and one, the Lockwood Committee found, that was used extensively by some of the large insurance companies, is to require the borrower to accept more or less "dead" property in lieu of cash for large portions of the loans made.

Thus, for example, it was brought how an insurance company in making a loan of $1,440,000 on a high-class piece of property in New York City required the borrower to buy from it 20 scattered parcels of vacant property at valuations totaling $600,000.

Excepting what was done by the Lockwood Committee, the writer is unable to find where any worthwhile attempt has been made by the varying public and semi-public agencies that have "investigated" the housing problem to go deeply into this most important phase of the subject.

Real estate operators, as a rule, have been disinclined to disclose or combat the evils of housing "financing" for the reason, if no other, that such "financing" has accelerated the upward trend of rents and prices and thus sustained the boom demand that has facilitated sales.

Real estate moves most easily, ordinarily, when prices for it are rising, and moves very sluggishly when prices are stable or falling. Thus it would seem that anything, no matter how unwarranted, which keeps housing prices moving upward serves the interests of real estate brokers, whose business is of such a nature that they don't have to give much thought to the lasting interests of those to whom they sell.

"The typical manufacturer is pleased with repeat orders," said Dr. John Gries, chief of the Division of Building and Housing of the United States Department of Commerce, before a meeting of the New York State Association of Real Estate Boards last October. "The average retail dealer's success depends upon repeated returns of his customers. Only stores with a transient trade skin their customers alive . . . . Many of your customers buy homes or property only once or twice. As a rule they are neither good judges of location, nor of construction or values. They do not know what to look for. Many are ignorant of the most common trade practices, ethics and law."

Therefore, only those real estate operators of long vision and sound social consciences have been inclined to fight for the interests of their customers.

How the Builder Figures

THAT enormous inflation has been loaded on to their customers is proved by the fact that it is the excuse given for the most atrocious of the practices that have contributed to it.

The builder on contract, in making estimates, as a rule has doubled, and more, his margin of profit, on the ground that he has to risk the likelihood of increases in costs of materials and labor during the period of construction.

Those who finance construction and sales exact huge bonuses on the ground that uncertainty as to the continuation of prevailing values increases the element of risk involved.

Thus a "vicious cycle" of inflation has been running, and it bids fair to run until the public is forced by impossible prices to stop buying "watered" houses. Then will come that reaction which leaders in the affected industries say probably will wipe out the handsome profits that have been made during the last few years by most branches of the real estate and construction trades. The one that will not suffer is that of the money lenders, who as a rule play safe. Instead of fearing a reaction they actually claim that in periods of depression their profits are larger than in times of prosperity. From the stock-selling literature of a mortgage investment company, that deals chiefly in second mortgage real estate notes, the following assurance is reproduced literally:

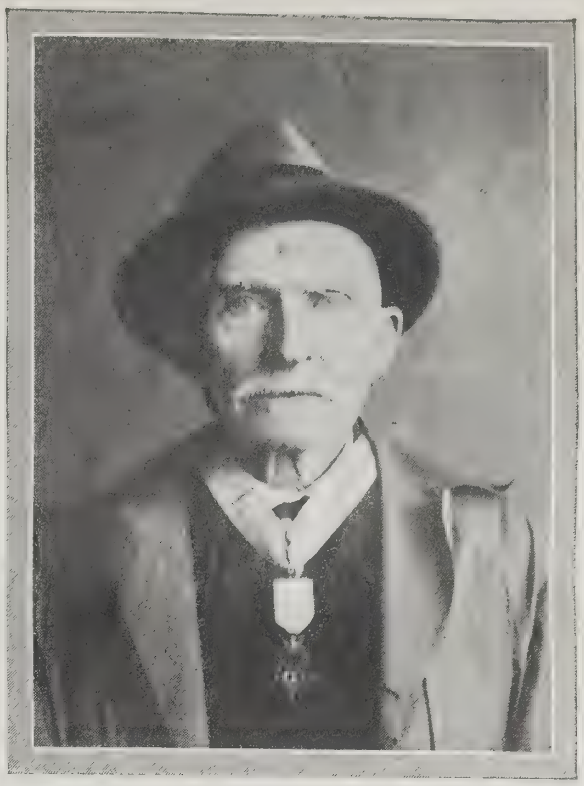
"A larger earning on your money in times of industrial depression when other sources of income are greatly lessened or entirely fail."

What it evidently claims is that, though profits on its kind of operations are large at any time, they are greatest during periods of industrial and financial stress.

A Half-century After Comes Congressional Medal

Nebraskan Tardily Rewarded With Valor Decoration for Heroism in Indian Days

By H. T. DOBBINS



LEANDER HERRON,
Holder of the Congressional medal.

REPUBLICS are not always ungrateful, but oftentimes they are forgetful. Forty-nine years after Corporal Leander Herron, of Company A, Third United States Infantry, had participated with conspicuous valor in one of the most thrilling one-sided battles with the Indians that haunted the Santa Fe trail before the railroad came to Kansas, Congress voted him a medal of honor.

Today, Corporal Herron, close to 80, still vigorous of body and mind, wears, with a pride that is shared by his fellow-Nebraskans, this insignia of honor, which, reserved as it is only for those who distinguish themselves by the very bravest of acts, has been issued to but 328 Americans in the 60 years since it was first authorized by Congress. It is a beautiful medal of gold, a five-pointed star inclosing a medallion, pendant from a bar surmounted by a spread eagle. It is attached to a bit of ribbon which, in turn, is fastened to a rolling collar when worn.

Corporal Herron is one of the last of the brave men who gave glory and luster to the old West, when the white man and the red fought for control of the great plains. Indian fighting, determined and revengeful as it was, bred a race of frontiersmen whose courage and daring were never matched and who, in spite of the disparity of numbers, outgamed and outfought the reds on many a field. "Buffalo Bill" Cody, "Wild Bill" Hickock, Kit Carson, Jim Bridgers, the most spectacular of these Indian fighters, have been embalmed in frontier history, but they had many prototypes and contemporaries of equal courage whose exploits were worthy of equal renown.

The fact that Corporal Herron was chosen by Congress for an honor denied to many of these others whose names are more familiar, possibly because of the one-time popular dime novel, makes his story worth the telling. Like Cody he was a pony express rider in the days when the vigorous warfare of the Indians had forced the abandonment of the stage lines, and it was while engaged in this perilous duty that he performed the exploit for which the government tardily rewarded him.

Five Thousand on the Warpath

IN 1868, when Corporal Herron was stationed in Kansas, the Indians were unusually troublesome. Subsequent events showed that a concerted effort to drive the white men from that section and to stop all overland traffic had been determined upon by the reds. Tribes that had fought one another in years past were banded together for this purpose. Mr. Herron thinks there were fully 5,000 of them on the warpath that year, and that if they had been better armed they might have temporarily succeeded.

Scattered army posts were depended upon by the government to keep open the trail between the Middle West and the Pacific Coast, where thousands had gone following the great gold strike in California and the trek to Oregon and Utah. Fort Dodge was the center of operations. After the stage lines had been forced to quit because of Indian raids and the determined character of the warfare carried on, a pony express line was started out of Fort Dodge.

Many pony express riders were recruited from the youths who had sought the frontier because of its lure of adventure, and some of them were soldiers detailed to do the work. The riding had to be done at night because death stalked on the trail of those who rode the great plains by day. Great bands of Kiowas, Comanches, Apaches, Cheyennes and Arapahoes, supplemented by Dog Soldiers, warriors drummed out of their own tribes because of their treachery and meanness and the worst of their kind, roamed the plains for hundreds of miles, patrolling the trails and raiding, killing, burning wherever they could find victims.

At Big Coon Creek, some 20 miles out of Fort Larned, now located in what is known as Pawnee County, Kansas, one of the sod forts so frequently used in those days was garrisoned by a sergeant and 10 men. It had thick walls of sod and a clay roof. There being nothing to burn, the Indians were balked in their efforts at practicing that favorite pastime of theirs. The soldiers were well-armed, excellent shots, and as long as they kept within the fort they were safe from slaughter. They lacked fuel, and were compelled now and then to search the prairies for buffalo chips. Every time they went after this fuel they ran the risk of an Indian attack, and nearly every time it came.

To relieve the situation, the government, when it could spare the men, and the time was deemed propitious, sent down a load of wood under guard. On the night of September 1, 1868, Corporal Herron left Fort Larned for the West with mail and dispatches. On the way he met a mule team hauling a government wagon filled with wood, and under guard of four soldiers. It had been sent from Fort Dodge, to the west of Big Coon. Looking back now it seems a foolhardy thing to send a quartet of soldiers into a country known to be infested with Indians eager to scalp and kill, but in those days it was all part of the routine. The boys were there to fight, eager to fight, and ready to trust to luck.

Corporal Herron warned them that there were large bands of Indians in that section, and that they should halt at Fort Coon and wait until a wagon train came along that would furnish sufficient numbers to resist an attack. He rode on to Fort Dodge 40 miles west, which he reached by daylight.

Ride Into Foes' Midst

THAT night he was ordered to take mail and dispatches back to Fort Larned, 75 miles to the east. During the day smoke signals of the Indians had been visible to the east of Dodge, and it was decided to send another soldier with Herron. He chose Paddy Boyle, a rollicking, dare-devil of an Irishman, who had the best horse in the regiment.

Close to 10 or 11 o'clock that night they heard the sound of gunshots and yells. They readily identified it as an Indian raid, and, following the code of the frontier, they promptly turned out of their course and headed for the scrap. They soon discovered that it was a wagon train attack, a replica of hundreds that occurred all over that country in those days.

Nothing daunted by the fact that hundreds of Indians were in the attacking forces, the two soldiers rode directly into their midst. In the darkness, making the noise they did, the Indians mistook them for members of their own band and no one tried to stop them in their dash for the wagon train. It was not, says Corporal Herron, until they were well through their ranks that the Indians found out that nearly a score of their number had been killed and that they were reinforcing the soldiers.

It did not prove to be a wagon train at all, but the government vehicle with the four soldiers who had delivered their wood and were on their way back to Fort Dodge. They had disregarded Herron's advice and started on the return trip when the Indians got after them. But the corporal had no time to give in detail to the disobedient soldiers his opinion of them. Close on the heels of the dash of himself and Boyle came the Indians. Protected by the wagon the six men were able to repulse the attack.

Herron Directs Defense

IN THE respite that followed Herron looked over the ground and found the soldiers had chosen a poor place in which to make a defense. The mules had been killed early in the fighting, and the men had fought from behind the wagon without any casualties to themselves. With daylight the Indians would begin their usual circling attacks, and with this barrier gone their lives would soon pay the forfeit.

All six men realized the desperate character of their plight, and that unless aid came from outside they would certainly fall victims of the reds, who vastly outnumbered them. They had recourse to the one expedient, that of sending one of their number to the fort for help. Because of his excellent horse Boyle drew the assignment. He took the first opportunity to slip off in the darkness, and mount his horse. The reds discovered him, and then came, as Corporal Herron puts it, "a bunch of shots and yells, and as things quieted down right away, we felt sure Boyle had been killed."

Herron scouted around and found a buffalo wallow some yards away. The five men pushed the wagon over to it and on top of it, and crept underneath. Then they took stock of their ammunition. Believing Boyle killed they knew their chance of escape was small and they discovered that their ammunition had run low. It was agreed that each man would keep one bullet to protect himself from the torture.

They had scarcely got settled in their new defenses until the Indians renewed the attack. Circling round and round they would turn to the charge, only to be repeatedly repulsed. Several times their charges brought them within a few feet of the wagon, but the deadly aim and the calmness of the men kept them from breaking through. Many of the warriors rode in the usual Indian fashion, hanging to the side of their horses opposite the soldiers, but the accurate marksmanship kept tumbling them off, now and then a bullet going through the pony and getting the clinging rider. Often the Indians stopped to pick up their wounded and dead. So sure were they that they would eventually win that they halted for this purpose when to have continued the charge would probably have carried them into the little camp.

Goes Through Unscathed

HERRON appeared to bear the fabled charmed life. Not one of the many bullets and arrows launched at them had hit him. Goodman, one of the quartet, was suffering from seven wounds from both arrows and bullets. O'Donald had come to hand holds with an attacking Indian and although he killed his man he had been badly hurt by a blow on the head from a tomahawk. Nolan, the remaining soldier, was out with his right arm shattered by a bullet, and Herron had to supply him with a loaded revolver.

All the time the supply of ammunition was fast approaching exhaustion, and when the Indians made ready for the charge again each man had been reduced to twelve rounds. They knew that the next rush would be the last, and reminding each other to keep his last bullet for himself they set themselves to meet it. But it never came.

Apparently the attacking forces had divided into two divisions, each to dash directly from opposite sides. Only one of these was in motion when the defenders threw up their guns to aim. Before they could do this a voice called out in English not to fire. Knowing that many Dog Soldiers could talk English well the besieged thought it a ruse to get close, but the next instant a carbine was tossed up into the air. Then they knew the man to be a soldier and the men to be from the fort. It was Paddy Boyle, who had got through safely and brought the men back with him on the gallop. The Indians fled. As the soldiers rode up Herron noticed every man was dressed in white.

"What kind of uniforms do you call this?" called out Herron to Boyle.

"Well, when I got there the boys were asleep," said Boyle, "and they didn't take time to dress. They ain't got anything on but their underclothes." And it was so.

An hour later a detachment of infantry, followed by wagons, an ambulance and a doctor ar-

How the United States Supreme Court Works

In This There Is Presented a First-hand Description of Tribunal's Customs

By J. M. SEABRIGHT

WHEN a boy—those of you who were boys—you doubtless passed through that period when inborn curiosity drove you to take apart father's best clock, that you might see how it ran—what made it go.

Or in those pre-movie days such of you who attended the theater must have wondered what caused the scenic effects in such melodramas as "East Lynne" and "The Two Orphans"—what made the snow fall and what the playing of forked lightning.

It was a like curiosity which seized the writer as he sat for the first time in the court room of the United States Supreme Court in the Capitol a few years ago and heard argued a famous case.

Burned indelibly into the mind was that picture, that solemn, inspiring picture, of the members of "the living voice of the Constitution" as they filed slowly into the half-moon of a room, led by the dignified Chief Justice White, the sepulchral silence of the moment before exploded by the court crier's "Hear ye! Hear ye!" And as I listened to cogent statement of brilliant counsel and to flashing argument between counsel and court, resembling the thrust and parry of expert swordsmen, I asked myself, "How does the tribunal work? What takes place behind the judicial screen? What makes it go?"

A haze—a haze—the impenetrable cloud of mystery still enveloped our chief judicial tribunal! And this in spite of the fact that that veil did not serve to increase the layman's belief in its sincerity, nor inflate his faith in its impartiality.

Like Diogenes I walked about, lantern in hand; unlike him I sought, not honesty but the how of judicial honesty. But the feeble rays revealed nothing.

At length, however, my quest met its own reward: former Associate Justice John H. Clarke drew aside, for me, the curtains; and the scene revealed took rough hold upon my interest, satisfied my insatiable craving, and convinced a doubting Thomas of the conscientiousness, industry, and honor of the nation's supreme tribunal of justice.

Each Judge Given Copy

"WHEN a case is called in the Supreme Court," began Justice Clarke, "copies of the printed record and arguments are passed to each judge and then the oral argument follows, the time for the latter being limited to one hour on each side of each case. It was an hour and a half when I went to Washington; and I am happy to say that it was on my motion that it was reduced to an hour. Sitting there for two years or more listening attentively to arguments, I had noticed that nearly all lawyers were through before an hour had expired, and that they spent the rest of the time either repeating themselves or talking at random, as if they thought that, if they didn't consume the whole time, the court would think their cases were not of much consequence. At all events it was reduced.

"After the cases are argued," he continued, "on each Saturday at noon the judges meet in the Capitol for a conference which, of course, is presided over by the Chief Justice. He calls the cases that have been heard during the preceding week and, after making a brief statement of the facts, he announces what he thinks the decision should be. Then follows discussion of the case. Sometimes this is long; sometimes it is short. Sometimes it is illuminating; sometimes it isn't. Sometimes it is animated and sometimes it is dull. But when it is concluded, the vote is taken and, of course, the majority determines what the decision shall be. Next the Chief Justice assigns the cases to the judges to write opinions; and it is one of the traditions of the court that a judge must write whatever is assigned to him. It may be a case involving a branch of the law with which he is not nearly so familiar as with some others. It may involve questions of practice that came up from code states, or from states with common law practice modified by statute, or from Louisiana with its civil law practice; it may come from the Philippine Islands or from Porto Rico. It may be a case which he can write in a day, or it may be one which will require a month. But whatever it is, he must do his best with it, without objection, and without suggestion of change.

"When the opinion is written, it is sent to the printer, and when the writer is satisfied with the form of it, he sends a printed copy to each of the other justices; and again, it is a tradition of the court, that the criticism of the justices shall be entirely free and unrestrained, except, of course, it is implied that it shall be constructive. It extends from punctuation to a discussion of the principles that may be involved in the case. These copies of the opinions with the suggestions of the various judges are returned to the writer, and he uses such of them as he may think will improve the original. It may be necessary for him to recast his whole opinion. At the next meeting of the conference, the first business is a call for opinions, which means that the judges who have written opinions shall answer whether or not they have a majority for them, as written, and, if there is a majority for them, they are announced at the next session as the opinions of the court.

Has Benefit of Criticism

"THUS every opinion of the Supreme Court of the United States," he went on, "represents not only the best that is in the man who writes it, but also the best that the criticism of every other judge on the bench can make of it.

"There is an erroneous impression that is quite widely entertained in our country—I heard it within a year in New York and in San Francisco—relating to the method of disposing of petitions for writs of certiorari which I should like to correct. So many petitions for such writs are presented to the Supreme Court, and they are disposed of often so promptly, that the notion has been spread abroad that the cases are apportioned by the Chief Justice among the judges, that each judge reports on the case assigned to him, and that his conclusion is accepted and announced as that of the court. Nothing could be further from the fact. Each judge receives a copy of the record, the petition for the writ, and the briefs in support of it, and each is supposed to, and actually does, work out to his own conclusion with respect to it. In conference the petitions are called and discussed, a vote is taken, and each is decided precisely as if it were an argued case. So that, on such petitions, the country and the bar may be sure they have the benefit of the judgment of every member of the court."

After a brief pause, Justice Clarke continued thus: "There is another misunderstanding which I think should be corrected. You see, I can say things now which members of the court cannot and some of them are things that ought to be said.

"Every third or fourth week in the court year the Chief Justice announces that beginning the next Monday the court will take a recess for two, three or four weeks; and, as these announcements are frequent, the notion is widely entertained, especially among laymen, that it is a very leisurely kind of life that the judges of the Supreme Court lead—that they are a group of leisurely old men, leading a leisurely life in a leisurely way in the leisurely atmosphere of Washington. As a matter of fact, these recesses are the times when the judges do their closest and most important work, for they are the weeks in which the opinions are written. Most of the judges work steadily day in and day out through all of these recesses. Some of them work best, they think, in the early part of the night; others think they can accomplish most in the early morning. It is an open secret that the present Chief Justice is in his study at five o'clock many a morning, and all Washington knew that the late Chief Justice White turned night into day when he was working on important cases.

"I think I saw as much of the American lawyer at work, between Boston and Chicago, in the 20 years before I went upon the bench as anyone is likely to see, and I say without reservation that I never saw a group of lawyers, anywhere, work with anything like the intensity of application that the judges of the Supreme Court of the United States work. They deserve what is said of them so frequently in Washington—that in time of peace the court is much the hardest working branch of the United States Government."

And He Won His Case

FROM this serious discussion of what he termed "bone labor" he turned abruptly and closed the interview by relating this amusing incident: "Once the court had been listening to Fourteenth Amendment cases for three or four days. You'll never know how the Fourteenth Amendment is overworked until you sit for two or three years on the bench of the Supreme Court of the United States. There are lawyers all over this country who seem to think that any judgment rendered against any client of theirs necessarily denies to him the equal protection of the laws or is without due process of law—or both.

"We had been listening to that kind of cases for several days when finally a man arose and stated a case of very different character. I had turned to the opinion of the Court of Appeals, as was my custom, because I had found by experience that I could, in most cases, get an understanding of a case more quickly from that than from the statement of counsel. I was reading, but with one ear open to what the lawyer was saying, and I remember very distinctly the thought went through my mind, 'This man has an extraordinary vocabulary and he is speaking with most unusual cogency; I wonder who he is?' I looked at the brief and saw his name, but it didn't mean anything at all to me.

"He continued in a sharp, clear, condensed argument for about 15 or 20 minutes, and then summing up briefly he paused and said, 'Your Honors, that is my case. I, of course, could restate it in a different form. I could amplify it and consume the rest of the time allotted to me, but from the attention I have received, and from the questions that have been asked me, I am sure that the points upon which I rely have been appreciated, and will receive the attention which they deserve.' Then, after another pause, he said, 'Time has dealt gently with me, your Honors, but I am no longer young; and I live in such a remote part of the country that it is highly probable that I shall never be permitted again to argue a case in this great tribunal. I leave my case with you, with the expression of the hope that it may be decided on the principles of substantial justice, and not upon the rule of practice founded in pure fiction, upon which it was disposed of in the courts below.' I am happy to say that his case was disposed of in his favor upon principles of substantial justice. I read the opinion a few days ago and I found myself as well satisfied with it then as I was the day I wrote it."

When American Gold Was Dumb

SOME years ago the representative of an American structural steel concern was sent to South Africa for a term, in the interest of his employers. He was well supplied with travelers' checks and letters of credit which gave him entrée into the best business circles. Of course his account was welcomed at the leading bank.

The time was since the lure of gold led England into the war of conquest with the Boers, and the Lion was in possession of the government Oom Paul had created.

The American here learned the lesson that every student of economics must learn, that gold of itself is not money and the phrase "Money talks" has no reference to coin.

The experience, which the gentleman himself relates in *Bankers' Monthly*, for October, 1922, should open the eyes of those who credulously believe the acceptance of American money "anywhere in the world" is because it is as good as gold. That fallacy has been exploded many times, but it was a new lesson to this gentleman, who might easily have been seriously inconvenienced had he not been in possession of unlimited credit from American bankers.

One day the American received from his employers, instead of the usual draft, a shipment of gold eagles and double eagles, bright and shining from the mint. Having no immediate use for them he took them to his bank and asked to have them placed to his credit on account. To his surprise the teller told him he could not receive United States coin. He called attention to the fact that they had credited him with his travelers' checks and his letters of credit, his drafts and even some paper money he had deposited. The teller told him that was so, but the gold he could not handle. Not to pursue the story in detail, he attempted to use the coins for his daily expenses, but could not. After some hesitation he offered them to two other banks, without success. To his question as to what to do with them, an officer of the last bank visited suggested he sell them at market price to some jeweler, who could use the metal in his business.

Willing to sacrifice the small amount he might be compelled to lose in such a trade, he visited a jeweler, who offered him the bullion value if he would have them melted, as there was plenty of fine gold on the market. This was more of a shave than he cared to stand. So he took the coins to his hotel and deposited them in his trunk to await his return to America.

As he tells the story, while anathematizing his employers for remitting him so much useless junk, his mind reverted to the time when he was enthusiastically opposing Bryan and shouting for a sound money, "gold coin good for its face in any part of the world." He also thought bitterly of the time when "Ikey Einstein," holding a British sovereign in his hand, remarked that it was money "that spoke in nine languages," while his gold was as dumb as an oyster.

It would hardly be fair—although the sequel has no reference to the fact the story illustrates that the theory of a dollar in itself worth its face anywhere except in the country which stamps it is fallacious—not to tell how the American secured a premium on his stock of United States gold coin.

When putting the gold away, he retained one piece in his vest pocket with some small change. At the club, in settling a bill, he took it out with other coins. An English friend saw it and asked if it was a sovereign. He told the inquirer it was a gold eagle, United States money. To his surprise he was offered more than its exchange value. Of course he accepted. The purchaser had the piece shaved smooth on one side, a couple of initials engraved on it, and presented it to Betty, one of the barmaids. The fad took, our American sold all his pieces, and every barmaid in Johannesburg who received one wore it proudly suspended by a chain or ribbon about her neck.

Of the incident, *Bankers' Monthly* has the following to say in a panel insert in the story:

"The accompanying article offers an interesting illustration of the significance of world dominion. Since the event related here happened, the United States has perhaps moved forward as a world power, yet it is unquestionable that the English sovereign occupies a readily negotiable position where the United States gold dollar is scarcely known and seldom ever accepted when it is offered. There has been so much talk about the supremacy of the American dollar in the marts of trade that the incident given here presents an interesting subject for consideration. How long will the American gold dollar be subservient to the English sterling?"

A Region That Rides on a Crust of Gold

Shut Off by Bad Roads, North Georgia Mining Country "Lives Off Itself"

By CLAIRE GILES

IN AN out-of-the-way section of North Georgia, 25 miles from a railroad, where the backbone of the Southern Appalachian range spends itself in several irregular, precipitous spurs or short ranges, lies the picturesque little village of Dahlonega (a corruption of the Indian Tah-lon-é-ka, "yellow metal"). Here, until the rush to California in '49, practically all the gold minted in the United States was mined.

Once a town of more than 5,000 inhabitants, with Nuckollsville, six miles distant, boasting a slightly larger population, Dahlonega today with its 600 souls is a typical mining town long after the gold fever has spent itself. She sits complacently over a crust of gold, lazily stretching herself in the sun.

It is not strange that Dahlonega lacks the spirit of enterprise. Shut off from the outside by well-nigh impassable mountain roads the greater part of the year, the wonder is that she has managed to exist at all. Asked of a native: "How do you make a living here?" the answer was: "Well, we just live off of each other, I reckon."

Forty-foot over-shoot water wheel at Cain Creek Falls, Dahlonega, Georgia.

However, the present indications are that, whether it is five years or 25 before the rich gold mines in that region will be reworked (as they undoubtedly will be) the Dahlonegans will soon be able to quit "swapping money"; for, during the past year definite steps have been taken toward bringing Dahlonega out of seclusion. Under the Federal aid road building plan graveled and top-soiled roads have made the town accessible even in the worst of weather. Summer visitors are already scrambling for accommodations, and a new hotel has been opened. The government owns thousands of acres in that section, and has just recently bought many more. A movement is on foot to use these beautiful forests for a great national park. Just recently a large sum of money has been made available for constructing a forestry road through the Cherokee reservation, and this will connect Dahlonega with the surrounding country by a good highway.

Dahlonega itself nestles in a picturesque valley 2,200 feet above the sea level. From the Mountain Inn, one of the highest points in town, one sees in silhouette off to the southeast a range of peaks, each peak as well known to the native as the names of his children. To the east is Mount Walker, an extinct volcano that has not erupted within the ken of man. And off to the northeast lie the two mountains, Findley Ridge and Crown Mountain, both rich in unmined gold, while in the distance the Two Sisters, seen on a winter's morning capped with snow, in the sunshine are a picture right out of fairyland.

The Mountain Inn, with its wide halls, beamed ceilings, open fireplaces; its flower gardens, grape arbors and lily ponds; the walls strung with stuffed game and birds. is an Old-World scene, rather than a New. Distinguished people from all over the world have been entertained at the inn. Says Dr. Arnold, the philosophical proprietor, a mining engineer who came to Dahlonega 20 years ago and believed it worth while to stick: "We stay at home—and the mountain comes to Mahomet."

The site of the Mountain Inn is intimately connected with the early gold mining history of the state, fraught as it is with romance and high adventure. In 1832, the state of Georgia conducted a land lottery, and for the payment of $5 a person could draw a lot in the gold section varying in size from 40 to 320 acres. Curiously enough, many of the valuable lands acquired in this easy fashion went just as easily, and some of them changed hands in ways that made interesting history. Lot No. 951 on which now stands the Mountain Inn, acquired for $5, was swapped to a bootmaker for a pair of high boots, and was later sold to the Consolidated Mining Company for $5,000 for a club house site. The inn was originally called "the Southern Club." Since then seven and one-half of the original 40 acres has been given to the town for a schoolhouse site.

The fate of Lot No. 999 was no less thrilling. Costing the original owner $5, some time later the Consolidated, needing the site for a stamp mill, paid the owner $250,000 for it.

Dahlonega is the third oldest incorporated town in the state, and boasts the oldest court house standing in the States. Built in 1836, of red brick and stone trimmed, with Gothic arches and colonnades running through from east to west and from north to south, a stone wall around its elevated foundation, it has stood serene through storm and stress—through comedy and tragedy. On its steps, in 1849, stood Dr. M. F. Stephenson, an assayer in the mint for 50 years, a practical mining engineer in gold, silver and copper mining, and a man who believed firmly in Dahlonega as a great gold-producing center, who made his dramatic appeal that made history. The California gold fever was at its height, and the Dahlonega miners had laid down their spades and were ready to go. Mounting the court house steps, he pointed toward Findley Ridge, and, his voice husky with emotion, pleaded: "Don't go, boys—don't go. Do you see that ridge out there? There's millions in it, I tell you—*millions!*" Many of them did go, carrying the expression, "There's millions in it" into the California gold fields, where Mark Twain hearing it, put it into the mouth of the character he created and called "Colonel Mulberry Sellers."

Hydraulic gold mining in North Georgia.

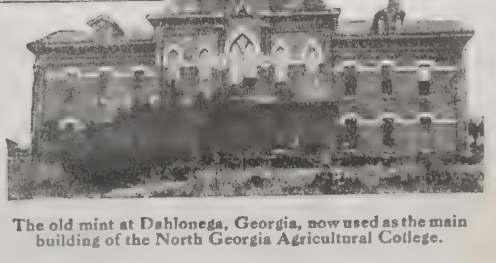
"Yes, it's a good court house," said Mr. Townsend, editor of the Dahlonega *Nugget*. "I have seen four jails wear out in the 67 years I have lived in Dahlonega, but the court house is as good as ever." Mr. Townsend has seen some strange sights in the 37 years he has edited the *Nugget*. He remembers when, in 1899, while grading in one of the side streets, they ran into one of the old unused shafts, and dug out about 1,000 pennyweight of gold. It was put into the town coffers. Another time, about 40 or more years ago, a vein was struck while men were digging a grave in a Negro cemetery. The gold is there yet. He remembers when they first struck gold on Findley Ridge, and came in all excitement, bringing nuggets in their pocket handkerchiefs. Also when they got out some gold that was said to assay $10,000 to the ton, the richest vein being found in an old tunnel that had been worked years before and the vein lost.

Nuckollsville, six miles distant, is a story in itself. There stood the first tavern, where laborers parted with their gold dust; also, until a few years ago, the first bank in the state—a small wooden structure with its doors driven full of nails as a protection against robbery. The Briar Patch mine at Nuckollsville was known far and wide as one of the richest in the Dahlonega belt.

Is Georgia, once first in gold production, coming back? Richer in surface gold than probably any other region in the world, and containing enormous deposits of low-grade sulphuretted ore, the question is being discussed in all seriousness in mining circles—will Georgia come back as the great gold-producing center of the United States?

More than 60 years ago Dahlonega had a gold boom. Now it seems likely that there will be another, but of a different sort. It will be a boom divested of the professional promoter, the lease shark, the speculator; of tent cities, the faro wheel, and all the attendant ills of the pioneer mining town. Science and chemistry have contributed much, even during the past 10 years, to the art of gold mining, and new methods have been perfected that will be used within a short time to mine ore. If gold mining has been divested of much of its romance, it has also been shorn of practically all its industrial risk. Mining is conducted with all the decorum and precision and attention to operating costs of any other gigantic industrial undertaking. When Dahlonega comes back, it will be with dignity and profit rather than with profligacy and wastefulness.

The history of the search for gold has been a story sometimes of greed, frequently of sorrow and deprivation and hardship, and often disappointment and death. Men faced dreadful perils to reach the gold fields of California, and in the gold rush to Alaska men froze to death on the terrible climb over the Chilkoot Pass. They washed gravel in the icy waters of the Yukon, thawed gold-laden gravel with hot boulders out of blue ice in the Arctic hillsides, and braved the dangers of the tropic jungles of Central and South America.



The old mint at Dahlonega, Georgia, now used as the main building of the North Georgia Agricultural College.

Gold is formed by the intensest heat within the interior of the earth, and (in a liquid state) is forced up through the cracks and crevices into rocky beds, where it is cooled That is why it is always found in small

Industry's Stock Dividend Melons—and Lemons

Fight in Congress to Make Dividends Taxable Led by Brookhart

By BURT M. M'CONNELL

WHEN Senator Brookhart, of Iowa, rose in the Senate recently, and called upon the Secretary of the Treasury for the names of companies which "may have evaded taxation" by declaring stock dividends in 1922, we learned for the first time that 328 corporations had make stock distributions during the year amounting to more than two billions—$2,149,000,000, to be exact. Not only was this information startling in itself, but the request made upon Secretary Mellon may be interpreted as the first gun to be fired in the fight to make stock dividends taxable. It may also explain in part the stock dividend epidemic which swept over the country in the closing months of 1922, when life was just one stock distribution after another; when a stock dividend of less than 100 per cent created not even a ripple, and the old Standard Oil figure of 2,800 per cent, which shocked the world at the time, was smashed to smithereens. Certainly the country never saw such an orgy before, and even at this late date many are asking what it was all about.

There probably isn't anything about which the general public has so many misconceptions as the voting of a stock dividend, and what it means to the stockholder. The proverbial 99 of every 100 persons believe, in fact, that in some mysterious manner such a distribution of stock creates new values. On the contrary, a stock dividend, as a rule, isn't a "melon"; it's a lemon. But before I tell you why this is so, let us trace the spread of the epidemic which started in Wall Street in October and spread throughout the entire country before Christmas. And which apparently hasn't yet run its course.

In October, you may recall, the air, in New York at least, was filled with rumors of stocks dividends about to be declared, and that scores of well-known stocks showed immediate advances in price on the strength of these rumors. Then the movement to distribute accumulated surplus by voting stock dividends really began when the Gulf Oil Company, of which Secretary Mellon's brother is president, declared one of 200 per cent.

"Secretary Mellon knows something, and has told his brother," said the wise ones, although the Secretary of the Treasury had announced that he was not seeking additional taxes of any kind. Then when various Standard Oil Companies declared a series of huge stock dividends the suspicion that a movement was on foot to tax the surplus of corporations became a settled conviction.

Before we go further in tracing the financial orgy that resulted, let us get clearly in mind what a stock dividend is. A large corporation, we will say, finds that it has a surplus, which is the amount of assets over liabilities and outstanding capital stock. Or, if this is too technical, suppose we call it the reserve which the corporation has put by for the proverbial rainy day, for, while corporations are supposed to be without souls, they have their rainy days, just like folks. They find it necessary to maintain a surplus, therefore, to meet contingencies and to provide for development. This surplus usually comes from past earnings which have not been paid out as cash dividends, but it may also come from appreciation of the company's property.

Surplus, however, isn't merely another name for liquid assets. It is seldom if ever cash in the bank, unless it is needed for working capital. On the other hand, it is usually represented by plant expansion, equipment, raw or finished products, or machinery. This property, machinery and equipment has been accumulated over a period of years while the business was being built up. The fact that many of the companies which voted stock dividends late last year have also borrowed money recently at high interest rates goes to prove that little of their surplus existed as cash.

How It Works Out

LET us assume that you are a stockholder, a partner, in a corporation that has accumulated a surplus. The corporation wishes to transfer this surplus to its capital account; it wishes to capitalize these earnings, in whatever form they may be. If you were the sole owner of a business, you could accomplish the same result merely by an entry in your books, but a large corporation votes to increase its capital stock and subsequently to divide this increase with its shareholders in the form of a stock dividend.

You own, let us say, a hundred shares of stock—one per cent—in a corporation which has 10,000 shares outstanding. These are valued at $100 each, so the corporation is capitalized at $100 times 10,000 shares, or $1,000.000. It has a surplus of $1,500,000, so the directors *could* declare a stock dividend of 150 per cent. But that would wipe out the entire rainy-day fund, so they compromise by declaring one of 100 per cent. Instead of having one share of stock, then, you have two, but your interest in the corporation—one per cent—remains the same; you merely have two pieces of paper where you had one before. If the dividend rate remained the same on the new stock, your income of course would be doubled, but it is usually cut in half when a 100 per cent dividend is voted, or reduced, say, from 12 per cent to three per cent in the case of a 400 per cent "melon." So your dividend return—your income from dividends—would be no more than it was before the distribution of stock. You would be better off only if your extra shares of stock could be sold for more than the original shares. But in most cases they couldn't, because the market price of a stock is largely determined by its earnings and dividends.

Corporations may declare stock dividends in the belief that future earnings will enable it to pay the old dividend rate on the increased number of shares, but this does not work out in practice. You may recall that in numerous instances the stocks which advanced in price last October, while stock dividend rumors were being circulated, actually registered declines after the dividend was announced. The corporation was no worse off for this action, nor were you any better off financially.

If you were a holder of common stock, in fact, you may have found yourself worse off, for after a stock dividend is declared the corporation's accumulated earnings are dedicated to the company, and are therefore no longer available for cash payments.

If you are a preferred stockholder, on the other hand, you are to be congratulated, for surplus consisting of equipment and property, once dedicated to the company through the voting of a stock dividend, cannot be disposed of. This means, of course, additional security for the preferred stock. In four of five cases we are safe in saying that the only stockholder to benefit from these distributions is the preferred stockholder. Especially is the common stockholder to be pitied if a poor year comes along—and they do—when his corporation, having put its surplus into the business, finds itself too poor to pay a cash dividend.

All these things being true, then, what is the explanation of the wave of stock dividends that swept the country in October, November and December?

The Steel People Didn't

THERE are a dozen so-called reasons, but perhaps the best one is fear of drastic tax legislation, sooner or later, by the new Congress. Corporations are obsessed with the fear that "radical" members of the new Congress will stampede the others into levying a special tax on the undistributed surplus of corporations, since the mass of voters do not own stocks, and therefore would not oppose such a move. They recall the threats that were made during the last Congressional campaign to tax undivided surpluses of corporations, and that this Congress of "blocs" has shown in a dozen instances that it will not be guided either by President Harding or the members of his Cabinet. Companies, therefore, feel that they must shield their earnings from observation, and hide their surpluses by including them in their capitalization. For if taxes are levied, they probably argue, they are not likely to be retroactive. If this is good reasoning, however, why has the United States Steel Corporation taken no action toward capitalizing its surplus? The directors of the "Steel Trust" are not the kind to be caught napping.

Another reason for voting a stock dividend is that the corporation, believing its stock has reached a price too high for the average investor, reduces the market price by splitting the share into smaller units. A corporation may also think it is good business, when it is earning 20 per cent, to capitalize its surplus by declaring a stock dividend, and thus reduce the rate of earnings to approximately eight per cent. By paying smaller dividends upon a larger capitalization, think the directors, the corporation is less likely to invite criticism from Congress or the people.

Several Senators and Congressmen maintain that stock dividends are voted for the express purpose of dodging taxes. Senator Capper, of Kansas, in fact, asserts that the Treasury is losing taxes at the rate of $500,000,000 a year because the Commissioner of Internal Revenue is not imposing the 25 per cent tax, provided by the income tax law, upon the net income of a corporation which permits its gains and profits to accumulate "beyond the reasonable needs of the business."

Brookhart Not Alone

THE Commissioner is not likely to enforce this provision of the income tax law, however, for he probably agrees that a corporation is the best judge of how much surplus it needs, whether that surplus be in cash, raw or finished products, ships, rolling stock, equipment, buildings or machinery.

There is little to support the contention that the government loses revenue when the number of shares of a corporation is increased by the declaration of a stock dividend. This act does not affect the assets or surplus of a corporation, point out Treasury officials, because surplus is usually in tangible property other than cash, and therefore cannot be distributed. The Supreme Court, furthermore, has ruled that surplus is not distributed by means of a stock dividend, and that stock dividends, provided out of undistributed surplus, are not taxable. In view of the Supreme Court's ruling, Senator Brookhart's fight to make such dividends taxable is likely to prove warm and interesting. And Senator Brookhart is not the only "radical" in Congress who is carrying on the fight, for others are known to favor a retroactive tax on undistributed earnings, or a special tax on stock dividends themselves. It is these men whom the corporations are watching; it is these men whom the corporations apparently tried to circumvent in declaring stock dividends by wholesale late in 1922. But the question that will occur to the reader is this: In their hasty attempt to shield their earnings from observation, haven't the corporations which declared dividends made conspicuous targets of themselves? Haven't they invited the attack which, judging from Senator Brookhart's move, is sure to come?

Canada's Literary Renaissance

THERE is a stir in the Northland. Canada has suddenly discovered the possession of a national literary conscience and is shouting her satisfaction from every housetop between Halifax and Victoria, not only that the man in the street below may hear, but in hopes that the man in the country below may also heed. Like all who have remained long abed she is hastening to make up for lost time and the wind of her bustle is felt throughout every publishing house on the continent. Never before has so much Canadian ink been poured out on Canadian paper; so many stories, essays, poems, been submitted to magazine editors; so many book manuscripts started out to seek their owners' fortunes. The rush began about two years ago until now it has attained the proportions of a national uprising of the ink-stained literati.

Who cast the first stone that started this avalanche of letters it is impossible to say. It is customary to blame the war for every unaccountable phenomenon. Certainly the rigid economy of the war tended to dam back the usual gentle flow of ink until a considerable flood lay waiting behind the sluice-gates for the return of normalcy. But it is safe to say that no previous holding back would have gathered such a volume in so short a time. It was as though all those who had been marking time for a decade had suddenly become fired with the zest of accomplishment, as though literary ambition had leaped into the heart of every school and college clamoring for expression, as though the greater the problems confronting the publishing houses the more insistent grew the voice of the public for a new, virile Canadian literature.

It seemed to begin as far back as June, 1914, when Dr. John D. Logan, Ph.D., one of the sanest of critics, came on the first volume of an unidentified writer and heralded the second birth of Canadian poetry. Then two years later another John the Baptist made his voice heard in the wilderness with a splendid anthology of "Canadian Poets," which proclaimed to the world at large the excellence of Canadian wares; and, again, after two years, Professor B. K. Sandwell, of McGill University, launched without money and without price a periodical devoted to "literature, the library and the printed book." With the coming of the *Canadian Bookman* the indistinguishable murmur seemed to coordinate and burst into one full diapason of sound. And last, and as a natural consequent, came the organization last March of the Canadian Authors' Association, with nearly 1,000 members and associates. The renaissance had become a *fait accompli.*

Now that Canada had found her five esthetic senses, the first thing she did was to scan her ranks for possible virtue. She found plenty of it, but to her dismay she also found much of it missing. Never before had she realized to what extent she was being systematically pilfered of her artistic brains. Pride in her lost legion was marred by regret. Late, but not too late, she stretched out her hand and laid claim to expatriated children of her loins:

"Bliss Carman, whom we believe is the greatest living poet, is mine," she cries; "Charles G. D. Roberts and Ernest Thompson-Seton, and W. A. Fraser and William J. Long, founders of the wild animal school of literature, are mine; Basil King, portrayer of the outer sense and the inner soul and of the dim, black gulfs behind, is all mine; Ralph Connor is mine, with his 1,000,000 readers; Gilbert Parker is mine and most of his romances have been plucked from my very heart; Agnes Laut, the historian; Marshall Saunders, of the children's classic, "Beautiful Joe"; Arthur Stringer and Theodore G. Roberts, the tellers of tales; Duncan Campbell Scott, Marjorie Pickthall, Robert Norwood and Robert Service, all are mine, and whether they reside in foreign countries or not, they are bone of my bone and flesh of my flesh."

It was not her artistic poverty nor her brutality that drove them out and they bore no malice apparently. Many returned to her side at the first call and last spring there was a regular family reunion. Bliss Carman was not only wined and dined (this was in Quebec) but showered with those honors that are so long withheld from a prophet in his own country—to say nothing of those profits that rightly belong with such honor. Basil King left his peaceful town where

> "The Cabots talk with the Lowells
> And the Lowells talk with God,"

to suffuse his benign enthusiasm over the seven (hundred) newly awakened Sleepers of Ephesus. They gathered from every village between Acadia and Victoria, the writers, publishers, sellers and buyers of books, drew up a kind of Declaration of Literary Independence and dedicated their services to "the mutual benefit and protection of the interests of Canadian authors and for the maintenance of high ideals and practice in the literary profession."

The results are already patent. Canadian publishers announce that the volume of manuscripts has doubled, with a remarkably high standard of quality; magazine editors are being deluged with fiction; bookshops are displaying and disposing of more of their country's wares than ever before, and when an author moves about the country he is taken in and set down at the right hand of the chairman, among bishops, generals and politicians. With such a beginning what will the harvest be? Canada is prepared to write and see.

Room and Board for the Birds That Serve

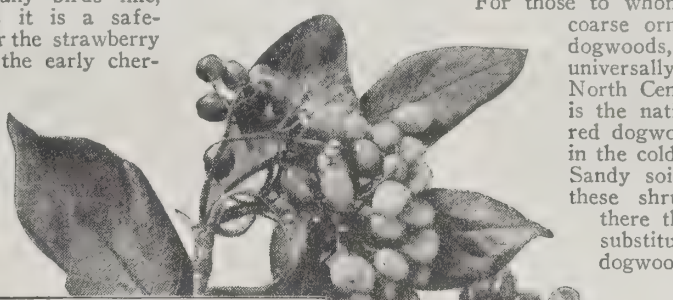
Quiet, Sheltered Spot With Suitable Trees and Shrubs Will Attract Your Feathered Friends and Protect Your Garden

By FRANZ A. AUST
Associate Professor of Landscape Design,
University of Wisconsin.

YOU call them thieves and pillagers; but know
They are the winged wardens of your farms,
Who from your cornfields drive the insidious foe,
And from your harvest keep a hundred harms—

sang the poet many years ago. If Longfellow had written today, it is possible that he might have added to his verse the thought, "Birds will not steal if they can find as much of their own natural food as they need."

The biggest strawberries and the ripest cherries and the fattest peas in your garden, to be sure, sometimes seem the natural choice of many a bird which you otherwise esteem as a respectable insect "cop." But look around. The chances are there is nothing else growing in your yard which will take the place of that part of the birds' diet. Birds cannot live on bugs and worms alone. They believe in balanced rations —even those varieties that seem to be most fond of a choice cut of grasshopper or corn borer or some other pest which destroys the growing crops. But they will not usually devour the tame fruits if there are plenty of wild fruits near.



Clusters of luscious fruit on native shrubs are a delight to birds and protect your own home garden.

One of the best ways to attract the birds which are so valuable to have about us, and incidentally to keep them law-abiding citizens instead of robbers, is to make a bird garden. On the farm, and in the smaller towns, and even in the city occasionally, some kind of bird garden is possible. There can be nesting places and well-stocked larders for many different birds, and some of them will stay the year 'round.

Japanese barberry is an addition to a bird garden. It furnishes food in winter and early spring, and forms a "safety zone" for smaller birds which like to nest in low-growing shrubs.

Now a bird garden may be elaborate and expensive, or it may consist merely of a few well-chosen trees and shrubs, a dish for water, and a place to scatter the winter crumbs. Of all these perhaps the most important is the well-selected tree or shrub placed in just the right spot. The number will, of course, depend upon how much room you have to devote to a garden of this sort.

A quiet sheltered place where the whole family can watch the birds from kitchen or dining room windows is ideal. For we all admit that one reason we wish to attract the birds is because our dooryards seem empty without them. This selected spot must not be too near the highway where passing travelers will annoy the nests. It must be away from the haunts of cats if possible. It should be sheltered from the wind, and yet it should have plenty of sun. Birds will not stay in a too shady location.

With care, many kinds of birds can be coaxed to nest in your garden. Trees will bring the robins and the orioles. The right kind of shrubs will invite smaller birds which nest off the ground. An elevated rock pile, perhaps, could be arranged with moss and leaves and grass in its crevices for those which choose to build on the ground or among the stones.

There are certain kinds of trees which can be universally planted, and which will furnish berries and seeds for the feathered folk the greater part of the year. The red cedar or juniper tree is one which has berries for every season. The red cedar is especially attractive to the cedar waxwing for both nesting and feeding. There are 35 other varieties, besides, which feed upon the berries.

Orioles often make their nests in the paper birch which grows 50 or 60 feet high. Of all bird friends, especially in town, the oriole is one of the most valuable because he eats so many of the pests which attack the fruit and foliage trees. For a part of his diet he relishes the seeds found in the catkins of the birch tree.

The Juneberry tree common throughout the Middle West grows 20 or 30 feet high. It has one of the earliest ripening fruits, a sweet berry which many birds like, and thus it is a safeguard for the strawberry bed and the early cherries. The mulberry too ripens at about this same time and helps to board more than 50 varieties of bird folk. While this tree will not always fruit in the colder climates, it will produce in any section where the cherry grows. Then there are the native cherries to protect the later ripening domestic kind. Pin cherries ripen soon after the Juneberry, and 66 different kinds of birds are fond of them.

At the most critical season, early spring, when birds return to the North and are able to find but little food, the red haw and the native mountain ash still retain their berries. These are especially liked by larger birds and will tide them over until other foods appear.

Of the low-growing shrubs, wild roses and the fragrant sumach form a pleasing combination, both because of their colors and because of their usefulness. These furnish food for 80 or 90 different birds every month in the year, or until all the berries are eaten. Fragrant sumach can be grown wherever forsythia or privet will thrive. The snowberry is another good choice, and this will grow wherever the fragrant sumach is hardy.

Native gooseberry bushes and the Japanese barberry are excellent selections of low-growing shrubs for an outdoor bird home. Gooseberries are ripe during the season of domestic fruits, and the barberry exhibits its cheery red berries during the cold snowy months. Both splendidly protect birds from cats, and even the weasel cannot enter this sanctuary. Hence many of the smaller birds will nest in their sheltering branches.

Of the higher-growing shrubs, the common cut-leaf, or black, elderberry is good. This combines well with other shrubs, and its fruit is valuable as a protection for the later blackberry bushes. Likewise there is the red elder, the fruit of which ripens before the black.

For those to whom the elder bush seems a coarse ornamentation, there are the dogwoods, red and gray. These are universally distributed throughout the North Central States. Since Siberia is the native home of the European red dogwood, this too can be grown in the colder sections of this country. Sandy soil is the only place where these shrubs do not prosper, and there the sand cherry is a fitting substitute for either elderberry or dogwood.

Native sumachs, staghorn and smooth, will grow farther north than the fragrant variety, and will furnish food for every season. There are the viburnums, too, one of which is the high bush cranberry with its fruit appetizing for both birds and folks. The black haw, or Indian raisin, with its fleshy blue berry, the arrow wood and the nanny berry with their brilliant fall colorings, are all additions to a bird garden. The deciduous holly, also, can be cultivated almost anywhere if it has plenty of rich soil and moisture. Both the male and the female plants are needed, however, so there must be more than one plant that the fruit may set.

One of the higher-growing shrubs is the high bush cranberry. There is ample room for nests in its branches and there is appetizing board later in the season when the berries are ripe.

Some birds are particularly happy where there are vines. The green, or "cat" briar, as it is sometimes called, attracts 38 varieties. Green briar, too, like some of the shrubs, is a good policeman, for it arrests many a feline tramp in search of a dainty meal. Wild grape and Virginia creeper can be grown along the fences, and 40 or 50 varieties of birds are known to be fond of their clusters of fruit.

There is a common notion that when a bird garden is situated near lake or stream, baths are not needed. But this is one feature without which no bird home is quite complete. From actual observation it has been found that most birds on the campus of the University of Wisconsin use the baths provided instead of taking their daily dips in the waters of Lake Mendota.

Provide accommodations for the birds that serve. They will not betray your hospitality.

Cabinet Dragged Into Cronkhite Case Through Intrigues of Racial Clique

Harding's Advisers Swayed Through Constant Pressure in Behalf of Rosenbluth

By CHARLES ALBERT COLLMAN

"His experience has qualified him for increased usefulness in the future and his past achievements entitle him to the commendation and support of those whom he has so faithfully served."—Louis Marshall, president of the American Jewish Committee, in urging the re-election of United States Senator William M. Calder, October, 1922.

IN PREVIOUS chapters on the Rosenbluth-Cronkhite case, detailed accounts were given of how, when Robert Rosenbluth was arrested in New York City, on March 23, 1921, at a place known as the Civic Club, charged with the murder of Major Alexander P. Cronkhite, a skillfully organized racial group, one of whose important activities is the protection of Jews accused of crime, came to his support, as it had come, in similar circumstances, to the support, in 1914, of one Leo M. Frank, at Atlanta, Georgia. A publicity scheme was launched, by which Rosenbluth was to be depicted as a martyr, the evidence against him discredited, a spurious "retraction" to be obtained from his accuser, and a fabricated "exoneration" published by his attorneys in New York. Thus Rosenbluth's case was to be tried in the newspapers, and he was to be acquitted outside the law courts, and without the customary trial by judge and jury.

Thereupon ensued a chapter of history which may be instructive in showing the ease by which crafty men can disrupt the fabric of fundamental law. The facts presented are of official record, and the reader may readily follow the course of this subtle intrigue to its logical conclusion and its inevitable exposure.

It may be well to review the Rosenbluth-Cronkhite case as it appeared at that moment. Major Alexander P. Cronkhite, a West Point graduate, while training troops for over-sea service during the war period of 1918, was shot and killed on a lonely trail in the United States Army reservation at Camp Lewis, State of Washington. The only witnesses present, Rosenbluth and Pothier, swore that his death was accidental. Shortly afterward, Rosenbluth was mustered out and immediately went to Russia and Asiatic countries in the service of Secretary Herbert Hoover's organization, where he remained nearly two years, on what appears to have been a wide variety of missions. His secret code book, dealing mostly with speculative opportunities attractive to International Bankers, is a part of the record.

Soon Found Discrepancies

BUT the talk of men of the 213th Engineers caused the Department of Justice to send its agents out on the case, and they soon learned that there were significant discrepancies between the facts of the death of the young officer, and the testimony as given by the two witnesses. This investigation was begun under the administration of the predecessor of Attorney-General Daugherty. It was some two years later that Pothier, a French-Canadian, importuned by Father Liberté, the priest of his church, to tell the truth, publicly admitted that he had perjured himself at the military board of inquiry, that he had shot the young major, and he incriminated his companion, Rosenbluth. Rosenbluth had just returned from abroad. Both men were arrested, charged with first degree murder. This was in March, 1921. The two men were then—as they are today, although indicted for premeditated murder—presumed to be innocent until proved guilty. But their innocence must and can only be established after a trial conducted according to the due processes of law. For the last two years, however, through bold intrigues that have become a national scandal, their trial has been delayed. Rosenbluth has been continuously at liberty while Pothier has been closely confined.

In practical politics it is an axiom that political support must be recompensed by the performance of adequate services made in return. There then appeared in the Rosenbluth case the personality of United States Senator William M. Calder, whose political preferment depended more or less upon the support of a large Jewish constituency in New York City. Appeared also Miss Katherine B. Davis, one-time commissioner of correction, by whom Rosenbluth, some eight years before, had been intrusted with prisoners from the New York City Reformatory for Male Misdemeanants, to be taken to a farm at New Hampton, New York, *of which activity more hereafter.*

Immediately on Rosenbluth's arrest, Senator Calder and Miss Davis, *knowing nothing of the case, entirely ignorant of evidence or testimony,* at once proclaimed: "He is innocent!" Which bare assertion, naturally, was of no weight or consequence whatever.

Miss Davis, accompanied by Rosenbluth, who had been liberated on bail, at once went to Washington, where, upon the unsupported statements of a man charged with murder, very oddly, Herbert Hoover, Secretary of Commerce, wrote a letter to his fellow member of the President's Cabinet, Attorney-General Daugherty, in which he said:

> This will introduce to you Miss Katherine Davis, who is interested in the case of Robert Rosenbluth.
>
> I would indeed consider it a favor if you see Miss Davis for a moment as I fear there is a great miscarriage of justice in the whole process.

Eight days later, on April 13, 1921, Senator Calder similarly communicated with Attorney-General Daugherty, in a letter in which he made the following astounding proposition:

From the Chicago *Tribune:*

Donald Ewing, of the Chicago *Tribune* staff, has just completed a series of articles dealing with the Cronkhite case. This marks the first attempt by the newspaper press to present an unbiased account of the facts in the death of Major Alexander P. Cronkhite, which occurred in the autumn of 1918. One statement which appeared in the last chapter of the Ewing series is worthy of reprinting here in connection with Mr. Collman's telling of the facts in the Cronkhite case, THE DEARBORN INDEPENDENT having been the first publication to reveal the truth in the mystery. Mr. Ewing says:

"Federal Judge Fields, in charging the jury said:

> **" 'You should indict only if you are certain that, if sitting as a trial jury, you would convict the men you are investigating. You are to indict only if you are certain they are guilty.'**

"The jury indicted Rosenbluth and Pothier for 'willful and premeditated murder of Alexander P. Cronkhite,' after 30 days of investigation. No United States attorney was present the day the indictments were discussed and voted. Seventy witnesses testified."

> United States Senate, April 13, 1921.
>
> My Dear Mr. Daugherty:
>
> The case of Robert Rosenbluth, which has already been brought to your attention by Secretary Hoover, and Miss Katherine Davis, is in my opinion of the highest importance and ought to have the most careful consideration.
>
> I am convinced that there are such extraordinary features in this case as to warrant my making a definite recommendation to you, that an entirely new and confidential and thorough investigation be made, employing men in no way connected with the case in the past, and receiving their instructions from, and reporting directly and only to either yourself, Mr. Gibbs (private secretary to the Attorney-General) or Mr. Stewart personally.
>
> I have asked Rosenbluth, if you would agree to order such new and thorough investigation, employing men and reporting only and directly to you, whether he would be willing to help you by revealing fully all the facts as he knows them, and furnishing names and addresses or records which could prove his facts, and whether he would waive all legal technicalities to further such an investigation. His answer is, "The only thing I am asking for is justice." He is here in Washington, "ready to go," when you order. In conclusion, may I express the hope that you will go thoroughly into this matter? My only interest is that complete justice be done.
>
> Sincerely yours,
> William M. Calder.

Here we see the studied attempt of a United States Senator, quoting the co-operation of a United States Secretary of Commerce, to bring influence to bear upon a United States Attorney-General for an abandonment of all established methods of legal procedure, thus tending to thwart justice in a criminal case.

Calder Didn't Want Much

FOR two years, competent Federal investigators and able United States attorneys, men of standing in their profession and the government service, had been working on the Rosenbluth-Cronkhite affair. For that entire period they had been endeavoring to get from Rosenbluth "all the facts as he knows them." Rosenbluth and Pothier had made numerous depositions, which showed wide and suspicious discrepancies from previous testimony. Through conscientious work, Federal prosecutors had developed matters to a point where they had felt justified in recommending the arrest of the two men on a charge of murder.

Now Mr. Calder requested the Attorney-General to sweep aside all this work, and permit a man, arrested and under bail for a capital crime, to direct the investigation of his own case. Secure in the advice of prominent counsel, who had been able to disclose to him the peril of previous admissions, this man was to have the opportunity of repudiating all his previous testimony, and clear himself.

Under our laws all are equal. Many men at that time were accused of capital crime. Each of them would have had an equal right with Rosenbluth to claim this special privilege. Under this precedent, as men eminent in the law are agreed, it would have been practically impossible thereafter to obtain a conviction for committed crime.

Mr. Daugherty hesitated, and no wonder. Eight days after the receipt of the above letter, when Senator Calder, Robert Rosenbluth and Miss Katherine Davis called at his office, he declined to see them. Few unused to public life know the tremendous influences secretly exerted upon government officers. The Attorney-General saw himself opposed by an organized race, and knew its previous successes in ruining the careers of men who had refused to grant its constant importunities. Other pressure was used upon him. **In the end he succumbed to the extraordinary proposal to accept the proffered "aid" of a man accused of murder. And he notified Senator Calder to that effect.**

But the plot to undermine the prosecution of Rosenbluth was of a twofold character. While on the one hand prominent men were trying to cozen the Department of Justice, with the secret design of nullifying its activities, on the other a scheme was being pursued to discredit the department in the public mind by tampering with an important government witness.

This was first indicated in a statement given to the newspapers by Senator Calder on April 22, in which he said that it had been reported to him that within the last three days, Pothier had declared that both he and Rosenbluth were innocent of the death of Major Cronkhite. Pothier had previously made a sworn confession that he and Rosenbluth were guilty of the young officer's murder, and it is not in human nature to suppose that a man of Pothier's type, when besought by a priest of his church to tell the truth, would have lied in making the admission that it was a bullet from his gun that had killed the major. But Calder's statement was a cue for the New York *World,* the semi-official organ of the New York Kehillah, to make an attempt to discredit Pothier's testimony. The *World,* after having first sent its reporter to see Rosenbluth and his attorney, Jonah J. Goldstein, printed an alleged "retraction" of Pothier's confession. This was immediately taken advantage of, in the manner previously described, to impugn the integrity of the Attorney-General and the department's prosecution of Rosenbluth.

Daugherty Senses Trap

MR. DAUGHERTY now realized the trap into which he had been led by listening to specious counsels. For the Department of Justice was suddenly in the receipt of letters from Jonah J. Goldstein, Rosenbluth's counsel, stating that he intended to move the court for the discharge of the bail given by his client for the latter's appearance before the United States District Court, for the Western District of Washington.

Mr. R. P. Stewart, the assistant attorney-general, was instructed to notify Francis G. Caffey, then United States Attorney in New York City, to resist Goldstein's motion with the utmost vigor. Mr. Caffey was informed of the circumstances by which a clique had deluded the department.

> A complaint had been filed before a United States commissioner in New York City asking for the commitment of Rosenbluth, to the end that he should be removed, under Section 1014, Revised Statutes, for trial before the United States District Court for the Western District of Washington, on the charge of murder, in connection with the death of Major Cronkhite, at Camp Lewis. The government was prepared to show probable cause for the belief that Rosenbluth was guilty of this offense, but Rosenbluth waived his right to a trial and agreed to his removal, and voluntarily entered into a bond, in the sum of $25,000, conditioned for his appearance before the United States Court, for the Western District of Washington, to answer to the charge aforesaid. If the proceedings had stopped there, Rosenbluth would, by that time (May 25, 1921) have been compelled by the United States

> to appear before the court in Washington. The matter did not stop here, however. Rosenbluth himself took the matter up with the Attorney-General, and urged, personally and through his friends, that he should not be compelled to appear before the United States Court, for the Western District of Washington, until and unless a full and complete investigation of the case, from his point of view, as well as from the point of view of Major Cronkhite's relatives, had been made.

(Note: The investigator, Mr. Chastain, who was detailed by the Attorney-General, at the request of Senator Calder, Secretary Hoover, Katherine Davis and others, to make this impartial investigation, was forbidden to communicate with Major Cronkhite's relatives. He examined six witnesses from a list of 108, whereupon, subsequently, the investigation terminated.)

Moved solely by the solicitations and representations of Rosenbluth and his friends, the Attorney-General ordered such a full investigation, and directed that no proceedings should be taken, looking toward Rosenbluth's removal to Washington, until the said investigation had been completed, and the result reported to him, the Attorney-General. The investigation was immediately undertaken in good faith and was carried forward with all speed. Under these circumstances, the Department was utterly unable to understand how Rosenbluth could consistently claim that he was entitled to be discharged from his bail, or what reason there could possibly be for discharging him. He had waived removal, he had entered voluntarily into the recognizance in question, and the delay in requiring his appearance before the United States District Court, was entirely due to his own actions, the Department having always had sufficient *prima facie* evidence to hold him upon the charges in question.

Hoodwinked—That's All!

THE truth of the matter was that the officials in Washington were utterly unaware of the unscrupulousness of the "oriental minds" that were being pitted against them in New York City. United States Attorney Caffey, in New York, quickly informed them of the manner in which they had been hoodwinked.

But the Attorney-General's fatal complaisance had set machinery in motion which he was no longer able to control. A month or so later, Rosenbluth's bail was actually discharged, and the man set free. The Department of Justice had apparently dropped the proceedings, the case was reported to be one for the state authorities, and the persons who were protecting Rosenbluth began to concentrate their energies upon the prosecutor of Pierce County, Washington.

Meanwhile, from Jewish circles, headed by Senator William M. Calder, there arose a sudden clamor in the shape of demands upon Mr. Daugherty that he officially "exonerate" Rosenbluth. But in the possession of Mr. Daugherty was evidence bearing upon the murder of a human being. Such evidence is like a consuming fire, which grows with attempts at suppression. He had no alternative. The evidence was presented to a Federal grand jury, at Tacoma, Washington, and it was corroborated by the testimony of more than 70 witnesses. Indictments for premeditated murder were found against Pothier and Rosenbluth and they were re-arrested. And at this writing, so stands the case against them today.

Now all pretense was thrown aside, and from Rosenbluth, his *counsel's law partner, Samuel Untermyer,* and the leaders of the propaganda, came loud outcries: *"Daugherty must be impeached!"* Not only the Attorney-General, but Colonel Hayward, in New York, in fact all officials of the government who in any way had been concerned in the Rosenbluth case were made to feel the wrath and venom of organized Jewry.

But the murder of young Major Cronkhite can never be suppressed, the men charged with it must be placed on trial, or the case will never die within men's memory, and those who are opposing the inevitable are conjuring up a storm that in the end must bring retribution upon the heaped-up influences of evil which have so long operated from New York.

After thus having reviewed the details of the plot designed to entrap the Attorney-General and disrupt the machinery of the Department of Justice, we must now retrace our steps to see what effect this intrigue exercised upon the affairs of the War Department. General Cronkhite, it will be recalled, while trying to clear up the mystery which had been enveloped about the death of his son, was ordered, against his protests, to quit the country and assume command of the Panama Canal Department. On the eve of sailing, he read the official announcement that Rosenbluth and Pothier were to be discharged from custody, without further prosecution. As it appeared that the Department of Justice was not doing what was necessary to convict those who had been accused of the murder of his son, on July 17, 1921, the general addressed a communication to Mr. Weeks, Secretary of War, in which he said:

> There is no question that, but for a peremptory order of the Attorney-General, stopping the indictment of the men charged with this crime, in order to hold an impartial investigation into the case, WHICH WAS NEVER HELD, these men would have been indicted and probably tried. There is no question that this action was ordered upon the request of Senator Calder, Secretary Hoover, Katherine Davis and others; that it was so published in the press, and so acknowledged to me by the Attorney-General.

Daugherty Rebukes Rosenbluth

Mr. Ewing again states:

*** * * *"Congressman Ansorge, of New York, wrote Mr. Daugherty that Captain Rosenbluth did not want to 'run away from any further investigation,' that he welcomed a full and fair inquiry before any duly constituted tribunal having authority, but did not want 'an investigation 3,000 miles away by a grand jury the Department of Justice itself previously has said has no jurisdiction.'**

"Mr. Daugherty replied that the facts did not warrant exoneration of Rosenbluth, and then continued:

"'Why should Captain Rosenbluth be permitted the unheard-of privilege of selecting the forum which is to investigate him? Why should not this matter take the ordinary course? Now that he is getting precisely what he prayed for at one time—a thorough investigation—he desires to take charge of it and run it.

"'Within a fortnight he was procuring a Senator to place before this department precisely what you have placed before it and, receiving what was an unsatisfactory reply to him, he appeals to you and as soon as he has this reply I am writing you he will then appeal to someone else, covering the entire territory of the United States.

"'There are very serious issues of fact involved in this matter and I cannot permit them to be decided by any unofficial referee at New York or elsewhere. The matter must take its ordinary course. If he has done no wrong he will be exonerated; if he has done wrong, he ought to be prosecuted.'"

> Again, Mr. Secretary, I protest against this action of the Attorney-General, and I request such action on your part, as shall insure the execution of his bounden duty in this case, prevent the flagrant injustice contemplated, by every means in your power; and thereby enable the determination of the facts in the killing of this young officer, whose life was cut short without warning, in the prime of his young manhood.
>
> I come to you at this late hour to ask your assistance because the Attorney-General has declined to see me since June 2, 1921, notwithstanding repeated requests on my part, and repeated promises by him that he would see me at the first opportunity.

Secretary Weeks Misinformed

GENERAL CRONKHITE received a reply from Major-General Harbord, in which the latter wrote:

> I am directed by the Secretary of War to call your attention to the loose allegations contained in paragraph 18 of your letter to him, involving as they do serious reflections on the Attorney-General of the United States and containing statements, which, while they may be overlooked in this instance because of the sympathy of the Secretary of War for you in your bereavement, must not be repeated. The allegation that the action of the Attorney-General was ordered on the request of another member of the Cabinet, a Senator of the United States, and others, throws so grave a doubt on the integrity of that office, coming as it does from an officer of the Army, that only the Secretary's sympathy for you and his belief that your bereavement has disqualified you for a dispassionate view of a decision which may be considered adverse, constrains him to withhold disciplinary action.

Rosenbluth's remarkable reason for not wanting to plead to the indictment of murder, as given below, is answered admirably by Thomas P. Revelle, United States Attorney at Seattle, who knows something of the evidence of the 70 witnesses whose stories brought the indictment of Rosenbluth and Pothier. Rosenbluth said:

"Personally, I would be glad to stand trial, but just after the indictments, Mr. Revelle, in a newspaper interview, said either side could raise the point of jurisdiction and that it might take four years for it to go through the various courts of appeal and be definitely settled. In the meantime I would be in jail under a murder charge and would not be permitted to give bail. So my attorneys insisted that the point of jurisdiction be settled before a trial was started. Commissioner Hitchcock held there was no jurisdiction. That seems to me to settle it. Revelle also said he hoped the point of jurisdiction would be raised. That indicated he might later raise it and the decision in my case be thrown out by a Supreme Court after I stood trial."

Mr. Revelle explained:

"I never said it would take four years to settle such a point. As a lawyer, I, of course, hope that some day a final court will pass on my brief contending the government has jurisdiction and will uphold it. Mr. Rosenbluth can come out here any time and get an immediate trial, and rest assured the government will never raise any such point. It would be foolish for the government to contest its own contentions."

The reader who has scanned the letter written by Senator Calder to the Attorney-General, *and the communication authorized by the Attorney-General to Colonel Caffey, in New York,* can readily see that the charge made by General Cronkhite was based upon authenticated fact, while Secretary Weeks was entirely misinformed as to the true situation. In fact, the criticism of Mr. Weeks indicates an actual condemnation of the influences exercised upon the Department of Justice by Senator Calder and his associates.

General Cronkhite's reply was:

> I request that a court of inquiry be convened to examine into the nature of the imputations made against me in this letter (of Major General Harbord), both as made direct and by implication.
>
> These imputations are a reflection on my character and reputation as an officer of the Army of the United States, in which I have served with unblemished record for more than 43 years. It cannot be within the purview of any person officially to assail the honor and probity of an officer, without a hearing and without a full and fair determination of facts.

The Secretary of War, on October 10, denied the request for a court of inquiry, although such a court would have immediately established the truth of General Cronkhite's so-called "loose allegations."

As may now be seen, *the first official imputation against General Cronkhite appears of record as of July 23, 1921, when what amounted to a reprimand by the Secretary of War* was administered to him through the Chief of Staff. Proud of his record and stung to the quick by the suggestion of wrong on his part, the victim of this rebuke was prompt to request that a court of inquiry be appointed to determine the facts.

Though it is not usual to deny an officer charged with misconduct the opportunity to establish his innocence by a court of inquiry, which is the means provided by the Ninety-seventh Article of War, for some reason in this case it was so denied. *And in so doing, a great scandal was suppressed.* It would seem that the Secretary of War, though undoubtedly acting in the utmost good faith, had pre-judged General Cronkhite upon the *ex parte* representations of his immediate superiors.

General Denied His Rights

THE Ninety-seventh Article of War which authorizes the President or any commanding officer to appoint a court of inquiry to determine the facts in the case where the conduct or character of an officer is impugned, also gives an aggrieved officer the right of appeal to higher authority where a request for a court of inquiry is refused.

Accordingly, General Cronkhite, in the full exercise of a vested right, appealed from the action of the Secretary of War to the President as Commander-in-Chief of the Army. If wrong on his part should be found by a regularly established military tribunal upon a full hearing of the facts, if it should be found that his abilities as an officer were impaired by his natural grief as a father, as suggested by the Secretary of War, if his services were no longer of value to the Army and the country, the general was anxious and willing to retire voluntarily under the provisions of existing law.

The President, however, did not order a court of inquiry, nor was it suggested by the President that General Cronkhite make good his offer to tender an application for retirement. On the contrary, the effect of his appeal was to cause the President, without confirming the rebuke administered by the Secretary of War, to direct that General Cronkhite be assigned for three months to the duty of collecting evidence in the case of his son for the authorities of the state of Washington in order that the crime which had been confessed might be punished.

The President, no doubt from the best motive, in overruling the Secretary of War, did not afford General Cronkhite the opportunity to establish his innocence of the misconduct charged by Mr. Weeks. The effect of this was not only to leave General Cronkhite in an unfortunate position with respect to his superiors, but to leave the written charges of the Secretary of War officially undenied upon his record. However high the motive of the President may have been, therefore, the effect of his action was none the less injurious to General Cronkhite.

When some of the facts in this case were recently laid before the Senate Military Committee by Senator Carter Glass, of Virginia, Senator Calder denied the charge that he had caused delay in the prosecution of the alleged murderers of Major Cronkhite's son.

"One of the two men mentioned in connection with the death of Major Cronkhite," said Senator Calder," is a constituent of mine, residing in New York City. I am absolutely convinced of his innocence. Every court or judicial officer that has so far passed on this controversy has failed to incriminate him. If you could see some of the correspondence I have had with the Department of Justice you would know that instead of delaying matters, I have been almost insulted by the department for suggesting that a constituent of mine was involved, and I would like to have a showdown one way or another."

The insincerity of Senator Calder's remarks is manifested by the fact that his constituent has been indicted for premeditated murder by a Federal grand jury at Tacoma, and owing to his refusal to meet the charge, no court or judicial officer has yet had an opportunity to try the case. Whether or not the Senator has been instrumental in delaying the trial of his constituent, the reader may judge in reading his letter to the Attorney-General, extracts from which have been presented.

The Senator, however, may rest happy in the endorsement of Louis Marshall, head of the American Jewish Committee, printed at the head of this chapter:

> **"His experience has qualified him for increased usefulness in the future and his past achievements entitle him to the commendation and support of those whom he has so faithfully served."**

He Wanted Cartridges, Got Warship

Concluded from page 3

"At that moment came the dull thud of guns, creating a tremor through the hotel building. Hurrying to the balcony the two Americans saw the *Maine* entering the harbor, bulbs of white smoke drifting off from her saluting batteries.

"The *Maine* steamed on in, piloted by an official Spanish pilot, and she was moored to a Spanish government buoy inside the approaches. The customary calls and salutations were exchanged between the Spanish authorities and the commander of the ship. Three weeks later the great *Maine* was a mass of twisted steel, her hulk resting on the bottom of the bay. Every school child knows what followed."

Such was Meriwether's story. He gave me many minor incidents touching on scenes and happenings in those memorable days but many already have been recorded in the pages of history of the war that moved America to its present place among the powers of the world.

"I have been asked a great many times," Meriwether added, "for an opinion as to the exact cause of the sinking of the *Maine*. The Sampson Naval Court of Inquiry found, as is a matter of history, simply that the *Maine* was sent down from an exterior explosion. It did not say in so many words that it was blown up by a mine placed under it by the Spaniards but I have never doubted that the court was convinced of that fact. The Spaniards would have been incredibly shortsighted if they had not placed a mine under the predetermined buoy to dominate any foreign vessel making fast to it, particularly with the strained relations existing with America. The *Maine's* guns absolutely commanded the situation once the ship was inside the harbor, for the Spanish guns overlooked the approaches and not a single one could be brought to bear on points inside.

"Aside from that feature, however, the physical condition of the wrecked battleship was evidence sufficient to convince the most skeptical. Its keel, ordinarily 35 feet under water, was bent and twisted until a portion of it was only 18 inches below the surface. It had been lifted up by the terrific explosion and no interior explosion could have left it there."

The veteran correspondent then unfolded another of the interesting facts surrounding the disaster which was responsible for a delay in getting the great news to America that the ship's keel was so near the surface, the news that was the clinching argument that war was imminent. Another cablegram that was misinterpreted kept the American people in suspense awaiting that decisive word.

"For days and days the American papers were frantically urging their correspondents to rush the story of the explosion as viewed by the Naval Court of Inquiry," continued Meriwether. "The correspondents were as frantic in their efforts to get the news. But the Sampson court arrived on board the lighthouse tender *Fern* and held its investigations secret. No newspapermen were permitted on board the vessel.

"Such was the situation when, one night while I was in my room at the hotel, someone rapped at my door. It was about 10 o'clock. Even after all these years I am not at liberty to reveal the name of the man who called on me, but he was a naval officer. I had been shipmates with him years before. He had been sent down to supervise the work of divers engaged in examining the wreck. The minute I saw him I knew he was excited. He came into the room and carefully shut and locked the door. Swearing me to secrecy and exacting a promise that I would not reveal the source of my information, he told me in one breath what the world was waiting to hear.

"'The keel of the *Maine*,' he said, speaking low and fast, 'is within 18 inches of the surface. We found it there tonight. Mr. Powelson was with me and he positively identified the keel plates.'

"Wilfred Van Ness Powelson was one of the constructors who had built the *Maine* and had been summoned as an expert to go over the wreck. I knew his reputation as a highly competent and thorough-going officer, and I knew that if he said the keel was within 18 inches of the surface it was information entirely to be relied upon.

"Here, then, was the biggest story of the day. It was the answer to the messages coming from the papers. The position of the keel meant only one thing, that the battleship had been blown up from a mine placed beneath it and not from an explosion of the engines or a magazine. It meant war.

"But how was I to get this pretentious news past the censors? The old rule of closing the office at 9 o'clock had been rescinded and the cable offices now were open night and day. But I knew, too, that Madrid and Washington were keeping it so busy that newspaper correspondents could get little through. What they did send was subjected to the closest scrutiny.

"I had been provided with a dispatch boat which I used in getting to Key West to file my stories but on this night she could render me no service. Harbor rules forbade vessels leaving between sunset and sunrise.

"The code book was of no help for it contained nothing by which I might tell my office about the position of the keel. I evolved several messages and finally hit on one which I proposed to try. I strolled into the cable office and scribbled this cablegram:

"'In important story which will be filed from dispatch boat in Key West tomorrow, please note that the main story is mine.'

"The censor, a Spanish colonel, had a knowledge of English that was disappointingly complete. He read the message and then inquired of me if I considered it worth while to pay high cable charges merely to claim credit for a story that had not even been sent. I explained my anxiety to have full credit, pointing out that the office would be certain to be impressed if I cabled. The colonel merely grinned. He made some remark about not liking the use of the word 'main' any more than he liked the use of the word 'mine,' and the message was passed back to me. All I could do was hand him a cigar and walk out.

"I thought of all kinds of messages which might give the office a tip and which I might be able to get past the censor. I knew a shift was made at 11 o'clock and I proposed to try something on the new censor who was due shortly.

"From the hotel news stand that day I had bought a copy of *Life* and had read Kipling's poem, 'The Destroyers.' I recalled a line in it which I believed I might be able to use, so I got the magazine and prepared this cablegram:

"'American colony in Havana much interested in Kipling's poem Destroyers appearing current issue of *Life*. Naval contingent assert technical accuracy of last verse impossible to improve upon.'

"This I handed to the censor. The first thing he wanted was a copy of the magazine. I had left mine at the hotel, so he sent a messenger out to buy one. The last stanza of the poem reads as follows:

"'The strength of twice three thousand horse
That serve the one command;
The hand that heaves the headlong force,
The hate that backs the hand;
The doom-bolt in the darkness freed,
The mine that splits the main;
The white-hot wake, the 'wildering speed—
The Choosers of the Slain.'

"As the crux of the situation was 'magazine' or 'mine,' I knew very well that my office would at once hit upon that pregnant line, 'The mine that splits the main' as containing the message I was trying to get to them.

"The messenger returned with the paper. The censor read the poem. He scarcely smiled when he remarked, 'Very clever,' at the same time handing back my dispatch.

"That ended my cable chances. I was forced to wait until daybreak to get out for Key West. There I wrote my story which occupied the entire front page of the *Herald* on the following morning.

"I refer to this to bring in the sequel. On the day I left Havana another correspondent got an inkling of what I had heard the preceding night. Having no dispatch boat he was forced to depend entirely upon the cable. Knowing from experience the difficulties to be encountered there, he wrote a purely descriptive story of the crowds on the Prado, the brilliant sunshine, sea breezes droning through the palm trees, the shimmering bay, and buzzards roosting on the keel of the *Maine*.

"As it all was extremely complimentary to the scenery and the climate, the censor let it go. But when it reached the New York office, the cable editor failed to catch the significance of the line, 'buzzards roosting on the keel of the *Maine*,' and, as the paper had no space for flowery descriptions, it was assumed that the correspondent at Havana had partaken of too much aguardiente, and the dispatch was spiked. A realization of what the correspondent was trying to tell his office came when the *Herald's* full-page account was published the ensuing morning.

"I've often wondered in the last few years what secrets will come out of the late World War when the newness has worn away in the years to come. Don't you imagine there is a sister-story to Caldwell's message story buried somewhere in someone's memory?"

A Region That Rides on a Crust of Gold

Concluded from page 9

quantities in any one place. There is a little gold all through the earth—in sea water and beach sand, in clay, and in common rock. It is only in mountain regions that it is collected in veins and pockets in rock layers.

Therefore, in every new gold field thousands of miners work small placer (pronounced "plasser") claims. All they need is a shack, food, a shovel, a miner's iron pan, and a sluice trough to wash out the gold. Of course, in a few years the cream is skimmed from these placer workings, and to go deeper into the bed of the stream, dredging is resorted to. Gold-bearing graveled hillsides are literally torn away by streams of water played on them with immense hose (this is called hydraulic mining).

The Georgia gold deposits occur in a number of narrow belts running in a northeasterly and southwesterly direction to the northern part of the state. The most important of these is the Dahlonega belt, which traverses the entire width of the state, and over into Alabama, being 150 miles long and from two to five miles wide. The first gold found in Georgia was discovered in White (an adjoining) County, and some gold milling is done in that county. The largest nugget ever found in the Georgia gold fields was found in White County. There is gold in Dawson County, and gold-bearing soil near Atlanta.

While there is no authentic written record of the early history of gold mining in Georgia, it is definitely known that the first discovery of gold in America was made in that state, and that long before the coming of the white man the gold mines in North Georgia were worked by the Cherokee Indians.

In 1829, the region of the Cherokee nation, which lay largely in the northern part of Georgia, was thrown open to white settlement, and a rather crude and hazardous form of mining was begun by the whites. John C. Calhoun, of South Carolina, was one of the earlier mine owners to begin operations in that section on what was for many years known as the Calhoun property, and the South Carolina Stillman family were said to have acquired their wealth from the Dahlonega gold fields.

The first gold issued by the United States Treasury was coined from metal mined in Georgia—this was in 1829. Dr. Arnold has among his collection of nuggets and gold-bearing sand and rock a $20 gold piece stamped 1848, and a $10 gold piece undoubtedly minted at Dahlonega, since it is stamped with a "D." The gold coin minted from Dahlonega ore is said to have a deeper golden tint than that coined from western gold.

In 1838 the United States government established a branch mint at Dahlonega. Up to that time it is estimated that $500,000 worth of gold had been transported to Philadelphia via the painful, slow, and hazardous overland route. About $6,000,000 was coined at the Dahlonega mint before its abandonment at the beginning of the Civil War, and about $30,000,000 worth of gold has so far been taken from the mountains of North Georgia.

The old mint is standing today, restored on its original foundations (having been partially burned) and is in use as the main building of the North Georgia Agricultural College.

The amazing part of it is that a large part—one mining engineer says 70 per cent—of the gold taken from the Georgia gold fields was taken out with picks and shovels. During ante-bellum days mine owners used their slaves in placer workings, and considerable skill seems to have been displayed by them in constructing wing dunes, sand wheels, and so on.

The usual method of working gold in Georgia was to reduce to a powder by a stamp mill. Sulphuretted and quartz ore have to be roasted in a furnace so as to expel the sulphur and then subjected to amalgamation or smelting. This process gets about 70 per cent of the gold from the ore. The cyanide process frees about 12 per cent more.

Dahlonega literally lies over a crust of gold. Veins of gold-bearing rock run diagonally across the town square, and dust and sand scooped up in the street will sometimes assay $14 to the ton. But (and this is the part they omitted in the mining prospectuses) it will cost probably twice $14 a ton to get out the gold. It is a common expression that "It takes two silver dollars to get out every gold dollar."

There has been little mining other than surface mining in Georgia, there being few shafts in the field of more than 100 feet in depth. One can look down Findley Chute—a shallow hole not more than 20 feet square, and at an altitude of more than 3,000 feet above the sea level, from which nearly $300,000 worth of gold was taken with picks and spades. There are a number of smaller and privately owned placers that have been worked regularly, and with profit, every four or five years since "time immemorial." A certain amount of placer mining is done there today. One can stroll over Findley Ridge or Crown Mountain most any day, and, finding a dinner pail under a tree and a coat or two hanging in the fork of a low-hanging limb, one can follow the trail and come across several men—or maybe one lone man—washing out gold with a pan. There are men in Dahlonega who have made a living for years in this way. There is an unwritten law that permits a man to pan gold promiscuously, so that without owning a foot of land he may wash out a precarious living unmolested. In California, if a man does not mine the minerals on his property, the state takes it over and mines it for him. Unfortunately, the state of Georgia has made no provision for a dog-in-the-manger policy in the Dahlonega fields, and a great deal of valuable property has remained unmined for 50 years.

Decaying buildings dot the mountain sides filled with expensive machinery rusting with disuse; machine shops with doors boarded up, unused flumes and power ditches crisscross the mountains, and ore cars with rusting wheels standing idly on spurs, all bear mute testimony to the devastating influence of the professional promoter, the fake mining "expert," and the gullibility of the public where yellow metal is found.

About a mile out from Dahlonega, down in a valley, there is standing idle today a 160-stamp mill capable of treating 500 tons of ore and 50 tons of concentrates daily, with a chlorination plant some distance away on the banks of the Yahoola River. This investment, involving something like $3,000,000, was the largest single mining undertaking made in Dahlonega. It is said that $1,000,000 was spent on the power ditch alone. The failure of this vast undertaking some 20 years ago undoubtedly exerted a disastrous influence over other mining operations begun about the same time that, under more economical management, and using methods better suited to local conditions, would no doubt have paid had not support been withdrawn at the critical moment.

Dahlonega's greatest handicap to deep mining has been the lack of mining engineering experience coupled with enough capital—and *simultaneously*—to work the mines there on a profitable basis. The consensus of opinion is that there are mining properties standing idle in Dahlonega that, with the logical and rational methods of treating a sulphide vein put into operation, are going to pay—and pay big.

New gold is being found all the time, and new methods are making it practicable to rework, with profit, old mines. As more railroads are built, more gold will be taken out of Alaska, Siberia, Canada, and Australia. Deserted mines in Mexico and Peru will be reopened. Western Australia is underlaid rich with gold. Mineralogists believe that the Western Hemisphere alone could supply the world with gold. And of this Georgia will undoubtedly contribute her share.

Ten Fingers Form Basis of Our Counting

Phoenicians, Greeks, Romans and Hindus Contributed to Our Modern Numbers

By CARL SCHURZ LOWDEN

IT IS said that one-half the world does not know how the other half lives. This may or may not be true, with our modern array of space annihilators and of time savers; but certainly there are large spots that still remain in Stygian darkness.

Down in South America the natives of Guiana have a system of numeration which they childishly cherish as their very own. Four fingers constitute four; to indicate 13 they display both hands and three toes. Twenty, being all the fingers and all the toes, is represented by a man.

The savages of Patagonia, the South Seas and Africa also count in much the same manner as do those in Guiana. They do not know how primitive their methods are. They do not know that long, long ago, many years before the days of Christ, the Phoenicians and the pre-Phoenicians were improving on the fingers-toes method.

As people became more civilized they showed less disposition to make use of the toes in counting. The fingers, however, continued in favor. Gradually they began to designate once around the fingers by the simple symbol of a circle, and even today once around these digits is indicated similarly. Take the number 10, for an example; the 1 signifies once, and the cipher connotes completion. But completion of what? The circuit of the fingers.

No system of figures was employed by the ancient peoples of Europe. They used the letters of their alphabet with the addition of certain marks to increase the original values. The early Phoenicians and the Hebrews had almost an identical alphabet and expressed numbers in practically the same style. Aleph, Beth, Gimel, Daleth and He, corresponding to our A, B, C, D and E, were in their regular order the numbers up to and including five. Yod, the tenth letter, had the numerical value of 10; but the next letter, Kaph, was a score. Koph, the nineteenth, represented 100; and the following letters, the final three of the alphabet, progressed by leaps of 100 in chronological order.

The Phoenicians, Greeks and Romans utilized certain devices to multiply the value of the letters in their rôle as numbers. Aleph with two points above it represented 1,000. To get the same degree of amplification, the Greeks placed a dot below a letter, whereas the Romans drew a line above. There were occasional exceptions to these rules, especially in the later development of the numerical system.

The general plan of the Phoenicians and Hebrews was followed by the Greeks, but the Romans evolved one of their own which appears irrational but really is not. They counted by fives rather than by tens, thus using one hand as a unit. Their 10, indicated by X, consisted of two fives, indicated by V, joined together; the lower one of these fives rested on his ears in an undignified position, but the Roman sense of harmony seems not to have been violated thereby.

C, D and M the Romans used to express 100, 500 and 1,000, respectively. These were the initials of the words, Centum for 100, Demi for half and Mille for 1,000. In this connection, of course, the D of Demi served admirably as the half of Mille. L signified 50.

Some critics claim that the Romans did not employ letters as figures. They say that certain signs which were used became identified with the letters by the mere accident of resemblance. They allege that 0 divided by a perpendicular line represented 1,000, which could easily be mistaken for an ornamental style of M. Half of this symbol, taken off the right side, naturally had half the value and looked much like a D. According to this theory, an upright anchor carried the value of 50, and when the left fluke happened to be broken off, it appeared to be a curved L. All these allegations, particularly the last, seem too flimsy to be regarded seriously.

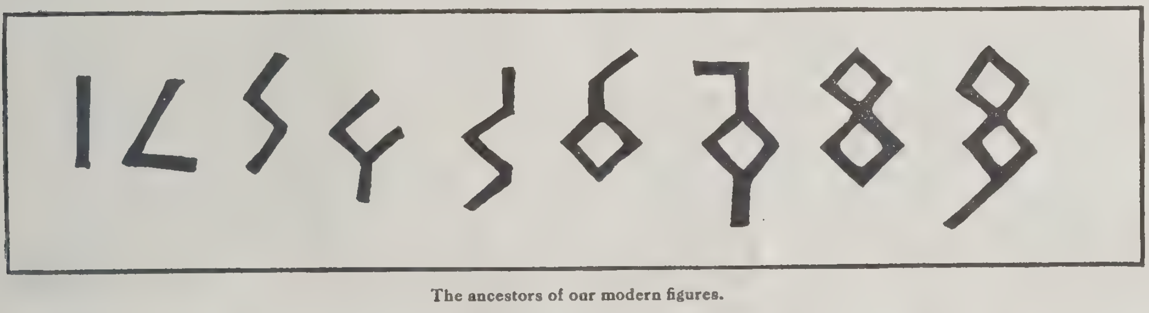
The Roman system was more negative than positive, and therein lay its principal defect. Whenever two figures were written together the first had to be subtracted from the second. X and L separated were 10 and 50, but together they were 50 minus 10, or 40. I and X separated were one and ten, but only nine when placed together. The notation of the Romans was too awkward and involved to be practical.

In 476 A. D. the great empire that the Romans had created fell before the barbaric hosts. Then a few centuries later the religion of Mahomet the Prophet swept over Africa and the East. In 711 Taric led the Saracens or Moors from Africa across the strait into Southern Spain. He planted the Mohammedan banner on the mighty rock which received the name of Gibel-al-Taric or the hill of Taric. Long ago we shortened this cumbersome name to Gibraltar, and Gibraltar it is today.

The Moors subdued Spain and overran France and would have penetrated farther into Europe if they had not been stopped in 732 by the terrific battle at Tours, which lasted seven days. Not until seven and one-half centuries later did the Christians of Spain manage to drive the invaders back to the continent from which they had come.

In the meantime the followers of Mahomet excelled in the manufacture of sword blades, in their knowledge of astronomy and mathematics. They taught the people to use chimneys in their houses and glass for windows. They were able to produce sugar and alcohol. In literature they made probably the first use of rhyme. Their great university was located at Cordova.

The Christians were jealous of the Moors because they possessed so many accomplishments of a useful character. Perhaps they envied the invaders mostly their ability to calculate quickly and accurately, next for the art known as alchemy, which developed into our modern chemistry. The Christians could not understand how the enemy appeared to perform miracles. They naturally felt that if any miracles were to be performed, they should not be performed by the hated infidels.



The ancestors of our modern figures.

What was the source of the Moorish power for calculating? What enabled the invaders to reckon with lightning-like rapidity? Finally it became known that their abilities were due to an art, called Algorismus, which was taught at their great university in Cordova.

There is a legend to the effect that a certain bright Christian scholar determined to acquire the art of Algorismus and then disseminate it. He did not relish the monopoly of the Moors. Accordingly, he dressed himself up in the Moorish costume, passed himself off as a Moor, entered their university at Cordova and there studied Algorismus. This subject dealt with the use of figures; when he had finished the course he knew the science and then he proceeded to give to the people the fruit of his investigation.

The figures the Moors used were supposed to have come from the Arabians; for many years we called 1, 2, 3, 4 and the rest Arabic figures. However, it is now regarded as more probable that they originated in India. In 874 a Hindu took to Bagdad some astronomical tables and gave to the teachers there the wonderful art of Algorismus. This name is now known to be a corruption of Abu Jafar Mahomet al-Kharizmi, who in the eighth century wrote a treatise on numbers and processes of calculation. Subsequently the book was lost to the world while the name itself has given place to Arithmetic derived from the Greek.

As to the origins of the figures or digits, ingenious investigators have supplied a plausible explanation. The Phoenicians used short perpendicular lines to express the numbers up to nine; these were arranged in groups of three. Perhaps the Hindus began thus, but it finally occurred to them that the lines could be written connectedly to a better advantage; so they or some other people worked out a different arrangement whereby two was represented by two sides of a triangle, eight by a double diamond and nine by a double diamond with a tail attached.

Now, of course, there is a natural tendency among most peoples to substitute curves for angles. Little by little changes were made. The diamond in the seven became just a heavy line, the six rounded out and the four kept its angles but became much more erect. The upper diamond of the nine was finally dropped. While our modern figures differ from these angular ones it is not difficult to identify the latter as their ancestors.

A Half-century After Comes Congressional Medal

Concluded from page 7

rived, and the injured men were taken to Fort Dodge. Boyle's horse died from the effects of the hard ride. Later he left the service and died in Kentucky before Congress could get around to express its appreciation of his valor. Two other men died in the service and Herron alone is left of the intrepid band.

Still further to honor him the government had him as its guest at Washington, where he appeared with other holders of Congressional medals as an official mourner at the funeral of the Unknown Soldier and his burial at Arlington.

Herron was a soldier of the Civil War, serving in the Eighty-third Pennsylvania Infantry. His father was a physician in Venango County, from which place the youth enlisted. The Eighty-third Pennsylvania was one of the distinguished fighting regiments of the War of the Rebellion. Its losses of 282 officers and men in action was exceeded by but one other in the service, the Fifty-fifth New Hampshire. After his return from service young Herron joined the oil rush of that section, but drilling wells proved too unexciting for him, and he enlisted in the regular army, and was sent to the West.

Fort Dodge was at that time, 1866, the center of active hostilities against the Indians of the Western Kansas plains, and offered the life of excitement that youth always craves. Herron volunteered for this service, and for several years was the contemporary of Cody, Carson and other famous scouts. An early and thrilling experience was being sent with eight others, under command of a lieutenant, into the Wichita Mountains after two white girls who had been captured and grossly abused by Indians of the Kiowa tribe. They had sent to the fort under a flag of truce a small party to negotiate a trade of the girls for something to eat.

It took days to make the journey, into a section that white men had never before pierced, and the detachment arrived at a time when several thousand of the braves were drilling on the prairies. The daring horsemanship of the Indian has always made him a picturesque figure when mounted, and when a thousand or two of them wheel and circle it is an imposing and fascinating scene. A bugle sounded as the detachment approached, and the massed warriors swooped down upon the little band of soldiers and their guides.

The fear of treachery on the part of the red was never absent from the mind of the white in the days when they fought for mastery of an empire, and before starting the soldiers had been drilled to expect it. They grabbed their carbines as the Indians came dashing straight at them, but when a few feet distant the bugle again sounded, and the advancing column broke into two divisions and dashed to the right and left. The exchange was effected, and the girls, in a pitiable state, were taken back. They belonged to a family captured near the Texas border. The Indians killed the father and the youngest child and took the mother and three daughters, all over 14, into captivity. Later the mother and the elder daughter were brought into the fort by Apaches, the military department at Washington forbidding any more details to be sent out on such hazardous missions.

The identity of the bugler was never disclosed. Corporal Herron heard similar bugling from the ranks of charging Indians in later campaigns, but the musician kept himself hidden. It has always been the army's opinion that he was a renegade who had learned the art while hanging around some fort or was some deserter from the ranks. While the Big Coon Creek fight has been celebrated in frontier history as one of the most valorous achievements in Indian warfare on the part of white men, it was not the only opportunity that Corporal Herron had to display his courage and resourcefulness. At that time a great tide of travel by wagon train was moving westward, and many of them outfitted at Dodge. The soldiers had often to furnish them protection and at other times to rescue them from desperate situations. Often nothing was known of their plight until a detachment came upon the burned and bloody refuse of a camp.

Torture and the torch were the fate of those who survived an attack and were captured, if they were men, and if women it meant the vilest of slavery. For a time the danger was so great that the trains were not permitted to move, and it was not until after hard fighting and relentless pursuit by the soldiers had put the fear of the white man into the hearts of the Indians and had broken their hope of remaining as masters of the plains that travel was again resumed in great volume.

Corporal Herron is one of the few survivors of those strenuous fighting days. He supplemented his experiences as a soldier in America by accompanying an expedition into the Trans-Caucasus country, landing at Baku in 1878. His dearest recollections, however, are of the frontier, with its fierce fighting, its sudden dangers and its thrilling rescues; and his greatest pride the golden insignia of heroic service and valor in action beyond the line of ordinary duty. A special pension accompanies the medal, and Corporal Herron is the only Nebraskan who ever received this special award.

BRIEFLY TOLD

Psychological tests designed to show whether it is possible for one individual to judge another in tact, intelligence and general character are being carried on at the University of Michigan.

The first city in Australia to pass the million mark in population is Sydney, New South Wales.

The little island, Hatsushima, in the Japanese archipelago is a communist island. Private property does not exist there. All wealth belongs to the community and it is forbidden to buy or sell. The natives live by fishing and cutting timber. There are some 40 dwellings and it is not permitted to add to this number. When the number of residents becomes too large, the excess migrates. The people live in peace and amity.

So far not a brick has been laid toward the restoration of Smyrna. The great seaport resembles San Francisco after its earthquake and fire.

Odd occupations are followed by students at various universities to pay their way through school. Among them are tuning pianos, watching children while parents are absent, selling salad dressing, house painting, grave digging and dance hall bouncer.

Pullman Company detectives have found stolen Pullman blankets being used for a wide variety of purposes. Some are used for lap-robes, women's coats, men's trousers, bath robes and children's clothing. Berth curtains have been found made up into a beautiful coat for a woman, and other curtains, with cretonne trimmings added, have been found as draperies and table covers. During 1918 and 1919, 8,200 Pullman blankets were reported missing from cars. Through the aid of the police and hotels much of this stolen plunder has been recovered.

A single seed or head of grain will reproduce its kind with marvelous rapidity. An example is the development of the Albion, or Iowa Number 103, oats from a single head selected in 1906 to a crop produced on more than 1 500 000 acres in 1919. This Albion oat is a prolific white variety giving an increased production of more than 6,500,000 bushels a year.

Rain-making is a futile undertaking, according to the United States Department of Agriculture. It is true that in the laboratory a small amount of moisture can be precipitated by the use of special equipment. However, to produce one inch of rain over one acre, approximately 113 tons of moisture would have to be drawn up into the air and then precipitated. The cloud that spreads over the house-tops represents billions of horse-power; and even if some artificial means were found to cause rain, only a small amount of precipitation could result. The various schemes to make rain and control atmospheric conditions are useless, according to the Weather Bureau.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

A silver tag attached to the dorsal fin of a salmon before its release after the eggs have been removed is resorted to by the Fisheries Department of the Canadian Government to trace the life history of fish. A reward of $1 is paid for the return of the tags, together with scales from side of the fish and particulars regarding weight, length and place of capture.

Hisses have been banned in the theaters of Rome, Italy.

To promote higher standards in industry the Chinese Chamber of Commerce in Shanghai recently approved a set of regulations in which the following are included: There shall be no employment of children under 12 years of age; one day's rest in every seven; sanitary conditions improved; safety devices installed for machinery.

Three thousand miles over snow and ice is the remarkable mushing record with a dog team made by a corporal of the Royal Canadian Mounted Police, stationed at Rampart House, on Porcupine River in the Arctic. During the winter of 1922-23 he has made three round trips between Rampart and Fort Yukon, each totaling 500 miles, one trip to Lapierre House, and several to Old Crow, and now he is traveling across the Arctic Divide, en route to Herschel Island, where he will spend the summer.

The clock of Christ Church College, in Oxford, England, strikes every night 101 times, in commemoration of the 101 students who were following the lesson when the college was opened.

An interesting relic of the Middle Ages is the palace of Philip the Fair, of which the main floor is yet standing. It is located in Paris, France, and was built in 1320. It contains three halls: the Hall of the Kitchens, the Hall of St. Louis, and the Hall of the Guards. Only to the last one are visitors admitted.

The smallest republic in the world is San Marino, situated in the Apennines Mountains of Italy near Rimini. It also claims to be the oldest state in Europe. It is 38 square miles in area and has a population of 12,027. It is not the smallest country in Europe, as the principality of Monaco is only eight square miles in area.

Armed guards patrolled the United Brethren Cemetery in Concha City, Oklahoma, to prevent oil men from desecrating the burial spot of 250 pioneers. The little churchyard stands like an oasis in the midst of a desert of oil derricks in one of the greatest petroleum-producing areas in Oklahoma. Oil men who came to inspect the graveyard were thrown bodily from the premises by the irate relatives who patrol the graves.

There are 371 distinct Indian tribes or remnants of Indian tribes in the United States, a total Indian population of 340,917.

Visiting on the telephone must stop in New England. That is the edict of the New England telephone companies and it has received official approval of the Massachusetts public utilities commission. Five minutes will be the limit. When a man calls his home he snorts a few monosyllables and hangs up, investigators report, but when a woman calls a woman friend she talks indefinitely. Business men are the chief complainants.

One hundred and ninety million cubic feet of gas roars into the air daily from the oil wells of Long Beach, California. Fifty million cubic feet is being wasted daily at Santa Fe Springs oil field, and 15,000,000 cubic feet at Huntington Beach.

A Rochester, New York, physician says that the natural position of the arms is downward and to hold both, or even one arm, above one's head is very injurious to both the arms and the heart. He deplores strap-hanging in street cars and warns those whose hearts are in a precarious condition to avoid strap-hanging whenever possible by waiting for the next car instead of crowding into one filled beyond its seating capacity. Those who are weakened by strap-hanging should lie down immediately upon arriving home, and in doing so lie either on the back, or face down, or on the right side.

PROPAGANDA OR FACTS?

The world today is flooded with propaganda. There is a scarcity of facts. Pick up a magazine or newspaper and glance through it. Aside from local news—how much dependable information do you find?
That is why Henry Ford established

The Dearborn Independent—The Ford International Weekly

A non-partisan, non-sectarian weekly magazine, devoted to printing facts—a chronicler of the neglected truth.

CHRONICLER OF THE NEGLECTED TRUTH

Whistler's London

Statistician Will Tell You of the Tons of Soot That Falls O'er City

By CLIFFORD ALBION TINKER

The great sweeping Thames embankment on a clear (?) autumn nightfall. One of Cleopatra's stray needles can be seen, anyway, also the garish sign on the Hotel Cecil, the "James' Brothers" hostelry on the Strand.

Whistler's London alone can dazzle with darkness. Here the ghostly columns in the portico of St. Martin's-in-the-Fields are dimly visible through a four p. m. fog across the bedraggled pavements of Trafalgar Square.

MORE than 300 tons of soot falls every year on each square mile of London. This is enough to build a pyramid four times as high as the famous clock tower over the Houses of Parliament.—News Item.

There you are. Some heavy-browed statistician, with a penchant for numerical oddities, has shattered the romantic Whistler's beloved smoke-fog into a trillion sooty fragments. And the item-searching proclivities of some grubbing "news-hound" have succeeded in broadcasting the malicious computations to the uttermost parts of the earth. Howbeit, the cat now out of the bag, I can tell what I know.

Admitting the claim that the "Three F's"—fog, fuel and flues—contributed much to the successful artistic inspirations of J. A. McNeill Whistler, and even to greater artists than Whistler, it must be admitted, also, that they are at the bottom of many peculiarities of London life and custom. From October to April, inclusive, those smoke-laden mists, ranging in consistency from bewitching transparency to eye-smarting, throat-burning, clothes-dripping murkiness, settle down over the huge capital, softening its monotonous chimney-potted vistas into vaporscapes of mild-toned loveliness. turning its arches, its columns, its domes and its sweeping bridges into phantom shapes of soaring mystery, or, as the case may be, covering the whole ocean of dwellings, shops and public buildings with a dense blanket of reeking, light-defying, acrid gloom.

Landseer's lions at the foot of the Nelson Column in Trafalgar Square look out upon a scene which might be Venice. But it isn't. It's foggy London, and the reflections are not cast *en pool,* they are the result of an afternoon of fog, a fog which leaves a film of sooty water everywhere about the city's pavement.

Somewhere between these extremes of cloud saturation and smoke suspension, equivalent to ophthalmic anesthesia to most mortals, the thrice-eccentric Whistler found joy of soul and prolific incitement to the highest expression of his art; hence we have "Whistler's London." On clear days, days bright with sunshine, on rainy days, snowy days, threatening days of lowery cloudiness, and just mere drab days, London is anybody's, say, Dickens's London, or Thackeray's or Pepy's, or Charles Lamb's, or even E. V. Lucas's; but on days when the mist and smoke are brewed by the North Sea breezes into an enveloping, wraith-producing mantle which drops "kerplunk" on the city from Putney to Leytonstone and from Goulder's Green to Greenwich Park, filling every nook and corner with odoriferous dampness, leaving every outdoor object with a deposit of sooty ooze, and even penetrating the houses and shops to the discomfort of stay-at-homes, shut-ins and clerks, count those days "Whistler Days"; no one else has ever claimed them.

Centuries before cannel coal was used as fuel and 10,000,000 flues belched forth their annual tonnage of soot, the fogs of London were known and dreaded. In days of old when knights were bold and strutted around in steel armor, many a knight, after a hard drinking bout and thus somewhat overcome in his cups, fared forth in the drenching mist only to be lost in its bewildering gloom. On such occasions the steel-encased "sport" generally stayed out until found by searchers, or until the fog dissipated.

Indeed, the first mention in British history of the old-time London fog occurs in a chronicle describing a knight staggering into a "smithy" near the Temple, there requesting in a loud voice that he be pried loose from his rust-bound armor, he having been lost in the fog and thus obliged to spend the entire fog-period in the woods back of Holborn. It is stated that the "armourer's devill," who pried the knight to freedom from the steel suit, gave vent to the declaration that: "Ye fogge is ye heyll on ye armour!"

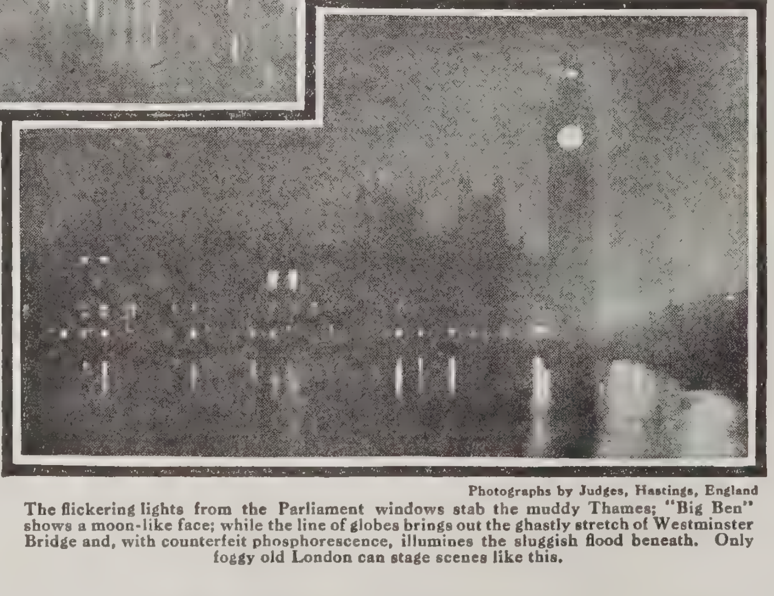
My first introduction to a "Whistleresque" afternoon was distinctly pleasing. I was in a happy mood to begin with, for I had spent the early afternoon in browsing through a justly famous bookshop on Oxford street; a place where may be found the most artistic bindings in all Europe, bindings with gold and silver tooling on rare leather, bindings of leather inlay colored and carved into brilliant figure work; and, too, a place where books "fit for a king" are sold, wrapped, and delivered to a king, as a much-emblazoned gilded sign over the shop entrance strikingly proclaims.

As I stepped from this shop to the street I found that a light mist had descended over the city; yet the sun, some two hours high, was strong enough to cope with the haziness. It was not gloomy, on the contrary the buildings and street life seemed particularly bright and distinct. The effect was magically lovely, in fancy, as though some giant unseen hand were holding before one's eyes an acre-square lens of palest amber. After such a treat, one could have sympathized with Whistler in his well-nigh desperate attempts to put like tints on canvas.

Walking over to Bond street, there to board a bus for Eaton Square, opened up a two-way vista along Oxford which might have been fairyland; even the excrescent blobs jutting out from the Victorian monstrosities built along this English Fifth Avenue of shops were softened into grotesque brackets and finials—unobjectionable at last!

But it was "bumpin'" along on that "bloomin'" bus on Bond street that heightened my pleasure and satisfied me beyond all cavil that traducers of London fogs, individually and as a class, should be designated as grouches, nincompoops and blighters.

By the time I had won a seat atop a bus—what with my shrinking diffidence and the jostling, elbow-pushing crowd of female shoppers hustling for home—the mist had become heavier, a real fog in fact, and sudden twilight had called forth a great burst of electric lamps in the stores and along the way. That old street from Oxford to Piccadilly was wonderland! Here is the premier jewelry market of the world. Diamonds, gold, silver, cut glass, perfumers displays, rare paintings, precious *objets d'art,* all these bits together with many hand-wrought extravagancies filled the windows, filled the long glass cases stretching down the lengths of the shops, while, readily seen from the top of the bus, long rows of cabinets of furry stuff and silks and rugs stood end to end in elaborate shops and decorated salons—Bond street might better be called "Luxury Row."



Photographs by Judges, Hastings, England

The flickering lights from the Parliament windows stab the muddy Thames; "Big Ben" shows a moon-like face; while the line of globes brings out the ghastly stretch of Westminster Bridge and, with counterfeit phosphorescence, illumines the sluggish flood beneath. Only foggy old London can stage scenes like this.

Underfoot, the whole business was bewilderingly complicated—the street being unbelievably narrow—and the hurrying buses, taxis, motor cars, bicycles, pedestrians, and stray London dogs furnished an intricate problem for our bus driver, who, thank goodness, seemed infallible; he never hesitated, but threaded along through the endless traffic, now dimly visible, with the ease of a ferret. To me, everything held a maximum of interest. That mist-laden atmosphere, with incandescent, man-made stars shining wearily through it, presaged romance. Ahoy, there! What appeared in the distance, a few moments since, for all the world like a huge battleship ablaze with lights pushing her glistening nose into the fog, turned out to be a two-story jeweler's shop with colored lights and plate-glass front!

Now we turn to the right into famous Old Piccadilly and shape our course for Hyde Park Corner. Things become increasingly interesting. Piccadilly at once appears a big dark river with towering cliffs on either side, the buses and autos like so many river-craft plying up and down. The "safety isles," each with a light-post in the center, resemble, with the people clustered about them, rescue rafts with submarined victims clinging to the signal masts. Down St. James street, on the port hand, can be seen, ghostly disc, the

Foundation for Philadelphia Art Gallery Costs $3,000,000 With $5,000,000 More Needed

Inquiry Into Profligate Spending of Taxpayers' Dollars Reveals City's Rock Sold to City by Contractor Awarded Work

By WILLIAM A. M'GARRY

THE story of how millions of public funds have been squandered in constructing an art museum is being slowly unfolded in Philadelphia. The museum was authorized many years ago by vote of the people, following the publication of plans calling for *the expenditure of $200,000.* Since then, by successive loans and appropriations, *a total of approximately $3,000,000 has been expended. For that sum foundation walls have been built.* An ancient reservoir surmounting a hill overlooking the heart of the city has been removed, thousands of tons of earth and rock have been carted back and forth, but so far the construction has not risen above the foundation level, *and there is no place to hang a single picture.*

The facts came to light when the Fairmount Park Commissioners of Philadelphia calmly asked for $5,000,000 additional "toward the art museum." That naturally led to an investigation, the result of which so far has been to show that one contractor was permitted to run an original contract for $621,350 up to more than $2,000,000, by methods that the state supreme court had held illegal in previous years when they were adopted by the city. The commission, however, is a state body, more or less self-perpetuated. It is one of the three factors constituting what has been called the "art oligarchy" of Philadelphia, the others being the art jury and the trustees of the Wilstach Collection, with which its membership interlocks.

Estimate Now Set at $8,000,000

ELI KIRK PRICE, a lawyer who has been under fire for years because of his avowed belief that what he and other art trustees do with public collections is literally none of the public's business, is bearing the brunt of the attack by city officials and taxpayers on the juggling of funds in the art museum work. Price, however, is not the highest authority on the park commission. The office of president is held by Edward Townsend Stotesbury, head of the banking house of Drexel and Company, of Philadelphia, and a senior partner of Morgan and Company.

At the time this was written he had not even taken the trouble to attend the hearings at which Mayor J. Hampton Moore and other city officials sought to straighten out the tangle. Needless to say, city council has refused to make any more appropriations for the work until more business-like methods have been adopted in the expenditure of the taxpayers' money.

Art lovers throughout the world have been interested in the ambitious plans made in Philadelphia for an art museum. As now planned it will be one of the most magnificent structures of its kind in any country. The original plan called for a single, small building of one wing, to cost $200,000. From that it jumped to $1 000 000, then to $3,000,000. An item of $800,000 "toward" the art museum was included in a general loan bill voted on by the people, and when the count showed a favorable vote, the park commission, it would seem, took it as license to spend all it could get on the museum. At any rate the $3,000,000 plans, on which the first contract for excavation work had been let and fulfilled, were expanded to $4,000,000 without any effort to get public approval in 1919, and in 1922 the estimate *was raised to $8,500,000 total cost merely to build the walls and roof and set the windows.*

"A Pipe Dream in Stone"

RICH patrons of art, some of them owners of valuable collections, have always been active in furthering the work of the museum to be paid for by the people. It has always been assumed by the general public that somewhere the city would get plenty of art objects to exhibit in the museum, once it was built. But in that connection it is interesting to have an expert's survey of the available pictures. Harrison S. Morris, one of the most active foes of the "art oligarchy," has furnished such a survey. "The art gallery now is simply a pipe dream in stone," he says. "It might be well to ask what is to be put in it. The Elkins collection, left to the city of Philadelphia if the art museum is finished in time, will provide less than 30 pictures. The McFadden collection will furnish 44 pictures. The Wilstach collection has been housed in Memorial Hall, Fairmount Park, for many years. The really valuable part of it could be placed in a small room. And all of that explains why there is such a tremendous demand for the Johnson collection. There are 1,300 pictures in that collection, and it has been testified that they would not fill one floor of one wing of the new museum, and yet there are eight wings to it with two floors to a wing, according to the great plan of the park commission."

The Johnson collection was made by the late John G. Johnson, noted lawyer. By order of the courts, after a bitter legal battle over his will, it is to be kept on permanent exhibition in his home, and it can never legally go into the new museum unless the Johnson home is destroyed by fire or falls apart. The city has spent huge sums in fireproofing that building. Hopes have been held out at times that some day the collection of paintings made by the late Peter A. B. Widener might be given to the city. That is now on exhibition at the home of his son, Joseph D. Widener, who was forced out of the art jury by reason of his arbitrary tactics some time ago. The Widener home was equipped with a special wing to house the collection, which is far less numerous than the Johnson group. It is considered extremely unlikely that the city will ever get it, and even if it did go into the museum it would be only a drop in the bucket.

Even in the face of those facts some art lovers would be in favor of a magnificent museum providing the taxpayers got their money's worth in the work being done. The suggestion has been made that such a building would inevitably attract gifts of masterpieces suitable to be exhibited in its halls. But the most optimistic friends of art have been appalled by the disclosures made in the hearings on the contracts approved by the park commission. To date it has been shown that the contractor got paid two or three times for the same work; that is, he made excavations paid for as earth, as rock and as wall demolition. Then he sold the rock, owned by the people, back to their representatives. Then he got paid again for putting it into place either as rock, or broken up for use in concrete. A small mountain of earth was moved across the street from the art museum hill. After it had hardened under the winter snows it was hauled back again for grading. Then it was dug up for a trolley tunnel.

In his attempt to defend these expenditures Price has asserted that no official estimate ever was made concerning the total cost of the art museum. He and other members of the park commission admit that they do not know now what it will cost to complete the building, when the interior construction is considered. He has attempted to deny that any one in authority ever fixed a limit on the amount to be spent. Unfortunately for him, there are official records. In the files of the city solicitor's office is a letter dated March 2, 1916, written by Thomas S. Martin, secretary of the park commission, who acted under instructions from Price. It was sent to the then city solicitor, John P. Connelly, mainly to insist that the $3,000,000 needed to complete the museum constituted an unfunded debt against the city's borrowing power. The following extract from the letter shows that there was an official estimate of cost at that time:

Contractors Fare Well

"OUT of appropriations made to the commissioners by councils, more than $200,000 already has been expended in preparing the site for the erection of the building, and by the ordinance of January 25, 1915, $800,000 was appropriated to the commissioners 'toward the erection' of the art museum. This sum has not yet been expended, but on January 12, 1916, his honor the mayor was informed of the amount, $3,000,000, required to complete the building shown in the plans and model, then placed on exhibition. In accordance with the official estimate furnished by the architects and adopted by the commissioners."

As an indication of how the plan has been exaggerated beyond the wildest dreams of those who first suggested it back in 1876, it may be pointed out that the $1,000,000 model for the art museum was designed to house not only the city-owned collections of masterpieces, but also to provide a home for the Academy of the Fine Arts, the School of Industrial Art and the Department of Architecture of the University of Pennsylvania. That building was to run straight across the Fairmount Reservoir grounds and it had no wings. Now all the other institutions have been dropped from consideration and the plan has been expanded to many times its original size. Two wings were added when the cost was estimated at $3,000,000, and the new design also called for a higher elevation. Changes made in 1917 and 1918 included two cascades or waterfalls and the remodeling of the hill on which the museum is being built, and the bulk of which is hard rock.

The contractor, whose original bid of $621,350 has been run up to $2,176,200 to date, is the F. W. Mark Construction Company, of Birmingham, Alabama. In the contract it is stated that the contractor might be called on to do some extra work over and above the amount provided for in the price named. He was therefore required to furnish unit prices on each particular kind of work, so that it would be possible to estimate how much he should be paid for the extra work. All the payments above the original contract price are made for that extra work, which begins to appear shortly after the contract was awarded. Another contractor who contended he was the low bidder attacked the award in court at the time, insisting that he had offered to do the work for $161,000 less than the first figure named by the Mark Company.

According to admissions made at the hearings, the extra-work clause covered up all sorts of unexpected costs. The price stated by the Mark Company for extra rock excavation was $2.10 a cubic yard. Other contractors asked for a flat price of $5 a cubic yard. All made their bids on the natural understanding that the rock so excavated belonged to the public. They were not informed that the commissioners would purchase the rock so excavated from the contractor at $5 a perch, and would pay also for the placing of the stone as backing for the retaining walls. As the contract finally worked out, the Mark Company got an initial price of $1.35 a cubic yard for excavation, $2.10 extra for rock, and $5 for selling the city-owned rock back to the city, or a total of $8.45.

Poof! Goes a Million

AT ONE time the city controller protested, asserting that he had no legal authority to pay out anything more than the amount of the original contract. The park commissioners promptly wrote him a letter saying they had approved the additional expenditures, and perhaps because of the presence of the noted financier on the board he let it go at that. An item of $299,194.49 for additional rock excavation was approved and paid. Another of $195,658.58 for additional terrace foundations and walls also was paid. Then came a small one of $6,365.26 for additional depth to the foundations in places where rock had been taken out. In other words, the commission paid for taking out rock and putting it back again. The next big item was for $135,978.75 for additional walls and foundations around areaways and the northeast terrace. Then also there was paid $216,798.55 for additional excavation and foundations on the west terrace, plus, later on, $89,000 for an additional rock outcrop.

It has been estimated by engineers that the total extra cost to the taxpayers by reason of the extra-rock clause to date has been $1,192,469.23. The "investigation" demanded by city council and the mayor before any more money is sunk in the stone quarry at the museum site was ordered by Mr. Stotesbury only after publication of the facts in the newspapers, or some of the facts. Mr. Price was made a member of the investigating committee. But, instead of helping the mayor and the city solicitor, he has taken the part of counsel for the defense.

So far the only thing that has been done to correct the situation here described has been a "promise" by E. T. Stotesbury that hereafter the park commissioners will adhere to the methods of making contracts that have been made compulsory for the city departments by the state supreme court. That promise was published in the newspapers as having been made by the financier to the mayor when they met recently in Florida. Nothing whatever was said about steps to determine whether the public is entitled to any recompense for the extraordinary sums spent in digging out rock, hauling it around and then hauling it back again. In that connection it was shown that one sub-contractor sold a large quantity of earth excavated. Since the commissioners were paying for the use of their own rock he concluded that they were just as indifferent about their own earth.

Get Authority From State

NOTHING that has happened in any city in recent years has served better to show up the lack of really representative city and state government than the art museum exposure. As pointed out above, the commissioners get their authority from the state. They control Fairmount Park by city sufferance, so to speak, including the parkway, a broad avenue running diagonally across the city from city hall to the entrance to the park. As part of their plan to eliminate trolley traffic from the parkway section in front of the museum, the commissioners had a trench dug for the building of a tunnel. They did not consult city authorities, although the trench interfered with city traffic and with city plans. It was not until the trench was dug and the commissioners wanted a temporary bridge built over it that the city engineer saw a plan of what was proposed. Motorists are compelled to make several turns as a result of the commission's tactics in ignoring traffic.

An incident in recent history may serve further to show the arrogance of the commission. It had been given control of a small plaza or square near city hall and fronting on the parkway, which is used for municipal band concerts. During an anniversary celebration of the twenty-eighth division the commission refused to issue a permit for the use of the square, which is cinder paved, to the veterans of the World War. They occupied it anyhow as a place for artillery display. Then the commission ordered them off, although city officials were taking part in the celebration. When the matter came to public notice city council took control of the square away from the commission, although Mr. Stotesbury pleaded that it would be a "humiliation" to the members of that body.

Discounting the Prosperity Chatter

BUFFALO bankers, according to *Truth*, a business weekly published in that city, are a unit in advising business men to operate with caution, but taking every advantage possible of present market conditions, maintaining at all times an ample margin of capital to avoid seeking credit if prospects of continued activity fade. They also recommend the utmost care in extending credit and in venturing too deeply to meet prospective business.

Financial organs are discussing the question as to whether the recent inflation of currency and credit has not gone far enough, and the necessity of guarding the value of money by reducing the stock in circulation and demanding liquidation of outstanding indebtedness. That such a movement will surely come at some time, is beyond question, although the people were not prepared for a repetition of the tactics of 1920 so soon. It behooves all to be prepared, however.

Meanwhile active operations of the new machinery for farm credits are going on, and the farmers and stockmen are being urged to avail themselves of the services of lending agencies even where there is no immediate prospect of cancelling an old or a new debt. Farmers should heed the warning the Buffalo bankers have sounded and confine their operations as far as possible to their own means. If a maturing debt may be transferred into a term obligation without increasing it, one is justified in assuming the new bond; but it would be in most cases a mistake to increase it.

Meanwhile the power to control currency and credit volume should be wrested from the money oligarchy which defies the government that permits it to exist.

Some Real History

"HISTORY is bunk" as history is written. We shall have no real history until humanity becomes sufficiently self-conscious to see the way by which it arrived at its present status. History is thus racial autobiography and like all autobiography it depends on the attainment of an objective consciousness of self.

Now it is part of the history—the unwritten history—of the development of our life, that usury, "interest," was once as great a novelty as was the motion picture 10 years ago or the automobile 20 years ago. There was a time when usury was so notably new a development that men discussed it as they now discuss prohibition. And that time is not so long ago, it is less long ago than the discovery of America.

It is worth realizing that usury, "interest," was once challenged by State and Church, and that in comparatively modern times. It is worth realizing that this thing which is up for discussion today has a history behind it which historians have not included in their books. It is worth knowing that the practice of usury once stirred up more dust than the coronation of a king or the inauguration of the President does today. There was a time, when among the people of our own tongue and stock, "interest" was the "paramount issue" in morals and business.

To open windows into that time, THE DEARBORN INDEPENDENT begins this week to print two articles which reflect as no modern art could do the state of mind with which our fathers first greeted the fact of Interest. One is in the quaint words of Roger Fenton, who wrote and spoke in London, 1611. The other is by John Jewell, Bishop of Salisbury, who died in 1571. Aside from the fact that they throw light on the rise of the financial system under which the world is now straining its strength, these old and honest statements show the reaction of the unspoiled mind to the thing in question. Historically, psychologically and economically, these two papers, rescued from the past, should prove valuable to all sorts and conditions of men.

One college president writes—"It is the interest that we are paying that is consuming our energies."

One clergyman writes—"Every Sunday more than $200 must be taken off the collection plates—the offerings of the people to God, the church and the poor—and paid for interest. Before anything else is paid in my church, that sum must be paid first."

Interest is a live question.

Solving the "Insolvable"

THE principal of Tuskegee Institute, Dr. Robert R. Moton, makes an interesting report which is significant as indicating the practical way in which this noble institution is quietly addressing itself to the difficult race problem, and unobtrusively solving the "insolvable."

First of all, the Negroes themselves are exhibiting a growing interest in the institution, supporting it more heartily than ever before, as the $75,000 in cash and pledges from Negroes toward the Loyalty Fund Campaign concretely proves. This sum is augmented by numerous bequests from Negroes toward the other funds of the institute.

The urgent need of this institution and of others of its kind and of the same high standards, is evidenced by the fact that although 3,261 persons received instruction at Tuskegee, twice as many were turned away. The Negroes were willing and eager but necessary facilities and accommodations were lacking.

The 95 per cent increase in enrollment in the Department of Agriculture is a very hopeful indication for the South. Dr. Booker T. Washington, the founder of Tuskegee, held that: "We shall prosper in proportion as we learn to dignify and glorify labor and put brains and skill into the common occupations of life."

What Is Propaganda?

PROPAGANDA is the art of insinuating one idea under cover of another. Recently a capitalist wanted to get certain ideas to his men: he had the ideas prepared by one skilled in the jargon of the water-front labor unions; he had them printed under a conspicuous union label; he had the printed leaflets distributed at the gates of his factory by men wearing the union button. The ideas were solely for his own one-sided benefit. That is propaganda. A clergyman uses the unctious language of the old orthodoxy to break down the intellectual content of it; he utilizes the old forms to sap them of their meanings; he allows his efforts to be "assisted" by outside interests who are wholly sympathetic with what he is trying to do, and wholly unsympathetic with the ideas and attitudes which he is insidiously attacking. That is propaganda. To take the natural instincts of the people for reform and helpful improvement and use those instincts as the motive power by which an ulterior result is obtained, is propaganda. To talk to the people about freedom and independence and national glory, for the sake of turning out one set of job-holders to put another set of job-holders in—that is propaganda.

But to take a fact to which the people are blind and hold it up before them in season and out of season; to wear your colors openly and state your objective plainly and use the simplest and most direct methods of putting your ideas before the consideration of other minds—that is not propaganda. The word propaganda is not in itself a bad one, and does not originally relate to bad practice. But it has fallen upon bad company. The propagandist today is a man who has something under cover—either the real objective to be attained, or his own relation to it.

It is one of the most difficult things for an editor and a reader these days to do—detect and eliminate propaganda. Our daily press and magazines are full of it. Various societies and fraternities and associations are full of it. Even the pulpit is ignorantly infected by it. What we need everywhere is, first, a straight road to the facts of a thing, and second, a straight mind to resolve the facts into their meaning.

The Britannica Is Now Anti-Semitic

NEVER was so much printed about the Jewish Question as is being printed today. Newspapers and magazines teem with it. Bit by bit the truth comes out, squeezed through the cracks of the fences which most editors try to straddle. Those who try to show the truth with one hand while they flatter Jewish sensibilities with the other find themselves in hot water. Those who abjure the truth entirely and yield themselves to flattery, as do the newspapers which are absolutely dependent, not on public confidence but on department store advertising patronage, find themselves in hot water also, for the Jew has a wholesome respect for anyone courageous enough to stand by the truth, but he despises the "gentile" trimmer. The *World's Work*, a magazine of character and ability, has recently concluded a series on the Jews, which articles were plainly intended to be a sop to the Jews, a sop flavored with sufficient fact material to placate the intelligence of the American, and the *World's Work* is now anathema for its pains. Even the senile Norman Hapgood who, assisted by a "second story" thief, shrieked most obediently for months through the tortured pages of Hearst's—even Hapgood, when he turned to Jewry for applause, got a loud horselaugh throughout the Jewish press. The Jews certainly need a "gentile" to guide them in the way that they should go through this time of controversy, guide them into the way of solution, but they will not find that mentor in any of their "defenders," which fact they know right well.

The first step might well be a dropping of the false cry of "persecution." To raise it again in the case of the Encyclopedia Britannica (as it has been raised in connection with Congress, Harvard University and others) is to follow tactics that lead to failure. We have examined the article in the Encyclopedia Britannica and it tallies exactly with every investigation, public and private, which has been made. The facts have been officially discovered and tabulated by every great government, including the governments of the United States and Great Britain. A Jew was a member of the commission which reported exactly these facts to the American Government. No official report ever made to the United States Government has ever controverted these facts.

For the benefit of the general reader we may say that in the article on Poland, the Britannica devotes a section to the Jewish Question, in which these statements occur: "In towns the majority of the shops are owned by Jews . . . . The eastern Jew is essentially a business or commercial man, but rarely a producer. He is usually a middleman or intermediary . . . . They are a race apart, hated and despised by the rest of the population . . . . During and after the war the hostility to the Jews was increased by the fact that in the German occupation the Jew was the willing tool of the invader and by the close connection between the Jews and Bolshevism. The hostility to the Jews was marked in 1918 and 1919 by excesses in which some 200 or 300 were killed, but which have been enormously exaggerated by the Jewish press."

All this is true. More is true than has been said: The statements really show great restraint. Nothing is more foolish than for Jews to attack the Britannica on a matter in which that institution could overwhelm them with most shameful evidences of Jewish deception of a credulous world—and not Polish Jewish deception either, but American Jewish deception for it was mostly managed from New York.

When, to curry favor with the Jews, Norman Hapgood makes it a crime to discuss the Jewish Question without reference to advertising patronage; when to curry favor with the Jews the Rev. Percy Stickney Grant offers to scissor the epic of Calvary from the New Testament; when to curry favor with the Jews the metropolitan press carries the demand that the Encyclopedia Britannica suppress the truth—we see the whole machinery of Suppression in motion. Suppression! And yet people call the Jews the cleverest people in the world! Have they not yet learned what Suppression does?

Now that Americanism is labeled "anti-Semitic," and the Church is labeled "anti-Semitic," and the Bible and Christmas and the public school and Congress are all labeled "anti-Semitic"; and our leading universities are labeled "anti-Semitic"; and our best magazines are labeled "anti-Semitic," it was only a matter of time before that ancient institution, the Encyclopedia Britannica, should be stuck with the same label. Here is Jewish *cleverness* again! They have overdone it.

Mr. Ford's Page

RECENTLY the statement was made that the tendency of industrial institutions is to become larger, and to such an extent would the increase go that our largest present-day manufactories will be small in comparison. The highest wages now paid will be a minimum then. The scale of production that amazes us now will seem very limited. In every line of endeavor there will come improvements that will make growth inevitable, until this our day will seem to have been a very modest threshold to the full development of man's industrial powers.

The statement seems to be well within the probabilities; in fact, it is hardly prophecy, since the actual beginnings are upon us. Strangely enough, however, the statement was resentfully received. Protests came from certain quarters, not as evidence of a determination to resist the unresistible, but as evidence of the extreme distaste with which some minds still view the industrial development. What a monstrous world this will be, some persons exclaimed, when industries become ten times as large as they are now! Who wants to live in a world harnessed to the wheel of all-dominating industry! Who wants to contemplate life as being bent exclusively to industrial ends!

> *PROGRESS consists in a number of related things changing together for the better. You cannot precipitate one improvement into a situation that would nullify it; it would be like commanding crocuses to appear in wintry weather. But when the weather changes, the crocuses come. No change comes alone. What would be a curse if thrust into the present condition, will become a blessing when conditions change to fit it. The entire process is involved. People are going ahead on this line or that, breaking their hearts because the special change they desire does not come to pass. If it came probably it would not fit. All things are changing together, and the proposed new thing if good will find its proper place in the new order. Progress is a new season and the rule of progress is everything in its season.*

Well, it all depends on the point of view. Once there was a naturalist who protested the advent of the motor car. With poetic scorn he denounced the car as breaking the silence of the country spaces and drowning out the fragrance of the wayside rose in gasoline fumes. It was like the protest Wordsworth made against running the railways through rural England. But presently our naturalist was riding in a car and learning more about his part of the world than he ever could have learned on foot. It is one thing to sit at home and try to figure out the disadvantages of progress, and another thing to make a personal test of the thing itself. The point of view is so important in these, as in other matters, that one is sometimes wise just to shift the point of view to see if the aspect of the thing in question changes with it.

For one thing, the protest comes mostly from those who are fairly well supplied with the conveniences and utilities of life which modern industry can supply. People who have bathtubs and motor cars and modern homes and electric lights and all the manufactured services which have refined our common life, are inclined to think that industrial development has gone quite far enough. They have been supplied, therefore the need is met. But if they knew what multitudes of people in all our cities are still living with the methods of half a century ago, multitudes who are still burning oil lamps and are still innocent of ordinary sanitary arrangements, multitudes who still lack homes and conveniences, they would quickly see that if it be the mission of industry to put these things within the possession of everybody, industry has only begun, and that vast reductions in cost and vast increases in production are necessary before the world can be supplied. They would see that industry, from being mere private business, a private venture or speculation in the field of manufacture, must become statesmanlike in its inclusiveness and organization.

The people who protest are afraid, of course, that the increase alluded to will only mean sharper competition, extremely high-powered salesmanship methods, lowered wages and an industrial slavery that will rest entirely on whirring wheels and not on sound natural foundations.

That is, they figure that only industry will change, and everything else will remain as now.

It is a mistake to lose sight of this fact—no change comes alone. The alteration is general all down the line. Change this, and that changes with it. Nothing occurs by itself. The entire process is involved. What would be a curse if precipitated into the present condition of things, will be a blessing when the present condition changes to fit it. We must make allowance for the whole spirit of the movement, which after all comes not of man's mind alone but is implicit in the urge of the universe.

Some changes would be a calamity if they were not met by other changes. If, for example, the railways were to be bought and run by the present government, it would be a calamity. But a government that included men who knew the management of great systems would render the purchase of the railroads a national benefit.

Certain things which belong to the public welfare are undoubtedly coming under public control, but to make this the advantageous thing that it should be, the character of public control is going to change. Changes must occur together to make the pattern a balanced one. Our government at present consists of a soviet of lawyers. Go down the list and note the occupations and you will see that lawyers predominate. The country is not represented occupationally—or, rather, it is represented occupationally, but by a single occupation, and that not the occupation most renowned for administrative ability. Lawyers are about as poor business managers as bankers are, and that is putting it pretty strong. But the country is still here, and down among the people there are the men—hundreds and thousands of them—who are competent to meet all the demands of a government that is actually in the service of the nation. That is one of the great things about our country—the man-power we need is here, but it has never been utilized under our lawyer-soviet form of government. When one condition changes, the other will change, too, to meet it.

A gentleman who has just been looking over the country reports that the people are more confident and more reliable and more effective than they ever have been, but that the official classes are everywhere less competent. It is a view easy enough to understand. Official life has lagged behind the people's chief concerns. There is little or nothing that officialdom can do for the people now, because it doesn't know how. When the people's concerns reach the point where Government service is necessary, the people will arrange for that service, though not through the old officialdom. Its day is over.

So that when we think of this or that new thing coming into the common life of the country, we need not think of it being misfitted into the present scheme of things. We ought rather to think of the complementary changes that will precede or accompany it. There are many things which become the wildest imagination if you conceive them as tossed into the present chaos. But conceive the present chaos showing a sign of order there and a sign of progress here, and then that seemingly wild thing takes on a domesticated aspect and an air of actually belonging.

The enlargement of industry would probably be a calamity in the present hodge-podge which we call industry. But this present system is not going to last very long. It is without plan and without control. It doesn't know what is best for itself or for the public. It's a great game of beating down labor and getting all that is possible out of the public.

But conceive industry as we recently, on this page, showed it to be becoming, factories being resolved into community service stations, the whole public utility service of our cities linked up with our industries, our raw materials and our food supplies linked up with the certain and continuous and prosperous and properly controlled employment of the people—conceive all the changes that must come to enable industry to be what it must be, a true public service in every respect, and then its increase and extension would be welcomed.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Largest Dirigible, Made in the United States, Soon to Take the Air in Flight O'er Jersey

Radical Changes Made in Construction of Huge War Machine Held to Bring Safety Denied to Crew of Ill-fated ZR-2

FROM a vast clearing at Lakehurst, cut away in the depths of the New Jersey scrub forests, a daring group of United States naval officers and enlisted men are expected shortly to rise into the air on the trial flight of the ZR-1, the largest dirigible in existence and the second largest ever built.

The ZR-1 was planned and partially constructed as a sister ship of the air to the ZR-2. It is now nearly two years since the world was startled by the news that the ZR-2, built in England, had broken into two sections over Hull, burst into flames and carried all but a few members of her crew to death in the Humber River. Since that time construction and assembly of the ZR-1 have been halted only long enough to permit such changes as were indicated by the study of what happened to the ZR-2.

Even under the original design, however, the ZR-1 differed from the ill-fated English-built ship in many important particulars. The American dirigible—the first of anything like its size to be built in this country—was constructed and designed at the Philadelphia Navy Yard, in what is said to be the world's largest airplane factory. Sections of it were put together there and then dismantled for shipment to the huge navy air hangar at Lakehurst, New Jersey. Shipment of the parts had already started at the time the ZR-2 was destroyed. Vital differences in the construction and design are summed up as follows by Lieutenant Emerson, who superintended the work at Philadelphia:

"Our dirigible contains approximately twice as many girders and half as many form-making rings as the ZR-2. The girders mark the compartments containing the 19 balloonets sustaining the dirigible. The rings are light metal lattices, placed between the girders to maintain the form of the ship. The ZR-2 carried two of these rings between each pair of girders, where our ship has only one ring, but our greater number of girders serve to maintain the form of the ship just as well as the construction of its British sister, although we sacrifice lightness, which means speed in rising and weight-carrying capacity through our construction. Our first consideration, however, is safety. Second comes serviceability.

"The wrecked ship follows in construction the German Zeppelin L-53, which was built in 1917. A number of ships of this type were built in Germany and copied by France and England. Our engineers, however, believed that the older type of Zeppelin is stronger and more serviceable under all conditions and they have put this opinion into expression in designing this dirigible. The smaller measurements of our dirigible also make for greater strength. The ZR-2 was 695 feet long, 86 feet in diameter, contained 2,700,000 cubic feet of hydrogen gas, was equipped with engines developing 2,100 horse power and carried a crew of 40 men. Our ship is to be 678 feet long, 80 feet in diameter, contain 2,100,000 cubic feet of hydrogen, engines developing 1,800 horse power and will have a crew of 30.

"The ZR-2 carried its keel compartment for crew, oil, and so on, slung below a line describing the circle of the dirigible. Our keel compartment will fall within the circle of the ship's body. The intervals between girders on the wrecked ship were 15 meters, approximately 50 feet.

The intervals between the stiff girders making for strength on our ship will be 10 meters, approximately 33 feet. Our purpose in general in building this dirigible is to make it along conservative, tried lines so that it will be successful from the jump. We don't want to skin it down for lightness nor do we want to load it down with girders unnecessarily numerous or heavy. Experiments were made constantly to assure us that we were going along the safe road."

Virtually all the parts for the ZR-1 are now at Lakehurst, including the covering, and all that remains is completion of the assembling of the huge airship. Work on that is progressing steadily, as the accompanying illustrations indicate. It is a matter of only a few months until the time arrives for the trial flight. Naturally the utmost care is being used to test everything that goes into the dirigible to prevent any possibility of disaster from structural faults. When the ZR-1 takes the air it will be mechanically right. The design, as indicated, already has been tested in earlier airships of the same type.

The hangar in which the ZR-1 is to be housed, and in which the work of assembly is now going forward, is almost as much of an engineering feat as the dirigible itself, and in the opinion of naval experts is destined to play an important part in the future of coast defense. It was designed to house the longer sister ship which was wrecked, as well as the ZR-1, and is said to be the largest single arch building in the world. As the site for it the Navy Department took over 1,400 acres of land near Lakehurst. The whole area was then covered with scrub oak, pine and underbrush.

Five hundred bluejackets were sent there to clear the land and build the hangar under the direction of Commander Taylor Evans, son of the noted "Fighting Bob" Evans.

COMMANDER FRANK TAYLOR EVANS,

Son of "Fighting Bob" Evans, in charge of the dirigible station at Lakehurst, New Jersey.

The hangar is 230 feet high and built of steel and concrete. It covers more than five acres, that being the inside area of the ground floor. Strung along either side are immense galleries that look small at their great distance from the floor.

Beneath them are the machine shops in which the Navy will construct parts for its big dirigibles. Even after the great shops were provided for there was still plenty of room for spacious accommodations for the officers and men. The building is 803 feet long, by 264 feet wide. Within it is room not only for the ZR-1, but also for another ship of the same size or larger.

The huge sliding doors with which the building is equipped at either end are in leaves, each of which weighs 900 tons and requires four 25 horse power motors to move at the rate of 10 feet a minute. These doors are especially braced against the terrific wind pressure by steel beams set in sliding counterweights of concrete. The builders of this structure say it would hold two city blocks covered with 16-story office buildings, and there would still be plenty of room.

A 250-foot steel mooring mast will furnish the docking facility for the ZR-1 while she is inflated. It is to be provided at the top with a revolving cone with a pocket into which will fit the nose of the dirigible, thus permitting the bulk of the airship to ride with the wind. Masts of the same type are already familiar in England.

The one at Lakehurst is to have such conveniences as elevators to carry the crew and supplies to the ship.

Docking rails also have been laid in front of the hangar. They extend far into the field from both ends of the big structure. The docking equipment includes special trolleys, with which it will be possible to drag the dirigible into the hangar with six men. Two lines, one on either side, will be thrown over from the airship and attached to trolleys, thus keeping the ship on an even keel. By means of drums the dirigible then can be drawn down until she is near enough to the earth to enter the hangar. The hangar is absolutely fireproof. It cost about $3,000,000, and an equal amount has been spent on the other buildings and improvements.

The hangar was constructed with the idea of providing plenty of light, yet furnishing complete protection to the dirigible from the rays of the sun. That has been accomplished by using an amber glass which is impervious to the violet rays that would cause disintegration of the fabric. It also keeps out a great part of the heat of the sunlight, thus making it easier to maintain a temperature constant or nearly so within the hangar, which is essential to control the expansion and contraction of the gas.

One of the most important features of the station is the gas plant, producing hydrogen for the ZR-1 and sufficiently large to care for a fleet of other dirigibles. There is a network of pipe lines for convenience in filling the bag. Hydrogen will be used to furnish the lifting power during peace time. In event of war it is the plan of the Navy Department to use helium, the new gas discovered only a few years ago, which came into some little use during the war. Helium is too expensive for general use except when there is danger of explosion. It is the lightest inert gas known, being absolutely non-inflammable, with almost as much lifting power or buoyancy as hydrogen.

At the time of the Armistice, American chemical engineers were producing helium in fairly large quantities, although in 1914—in fact, as late as 1917, when the United States entered—it was considered a rarity. It had been obtained in the most minute quantities from certain natural gases. Prolonged research led to the discovery of new methods for extracting and manufacturing it, but even today it is far more expensive than hydrogen. It has been pointed out that the ZR-1 will have 19 balloonets. In time of war helium would be invaluable, since a puncture of one of the gas bags even with a flaming bullet would not cause a fire and the dirigible could be kept aloft on the buoyancy of the other bags.

A huge acreage has been cleared around the hangar, as in the very nature of things the dirigible station will demand a large landing field. Thousands of scrub trees and underbrush were rooted up and a special grass seed was developed. Lakehurst expects this spring and summer to have the largest lawn in the world. Plans for the future development of the air station have not been divulged in detail by the Navy Department. It is generally understood, however, that it is to be the dirigible assembly center of the United States, and eventually it is likely that they will be built there. Later other hangars will be put up and some day Lakehurst may have the greatest fleet of lighter-than-air machines in existence. The dirigibles will play an important part in the future coast defense policy of the nation.

As an idea of what the aerial engineers have in mind for possible future experiment, it may be pointed out that the hangar is big enough to accommodate two dirigibles of five million cubic feet gas capacity each. Nothing of that size has been built as yet and it is unlikely that any immediate attempt will be made in that direction until experiments now contemplated have been completed. Although there are all sorts of statistics available as to the behavior of Zeppelins constructed along the same general lines, the future design of American dirigibles will depend on the result of tests in the meteorological conditions obtaining along the Atlantic Coast.

Whistler's London

Concluded from page 2

clock-face in the tower of ancient St. James's Palace, it might be a lighthouse to fix the voyager's position, pointing out the course to steer. Over on the starboard hand show the yawning fiords of Albermarle and Arlington streets, dismally mysterious, yet appealing, as we pass. The Ritz, to port, is a big promontory, while, against the opposite bank, Devonshire House, with its symmetrical forecourt, is a magnificent steamboat landing graced by light-bearing pylons and protected by a dark breakwater.

Then, on the right bank, we discern a cliff-like boldness, this is Clubdom; on the left, the banks give way to a stretch of wooded shore, this is Green Park leading downhill to the Mall and Buckingham Palace. Next, dead ahead, we spy the clustered lights of Hyde Park Corner, lights numerous enough to force their brightness through the gathering gloom and show us Apsley House—"Number One, London"—four-square to the fog, staunch and rugged like its one-time owner, the Iron Duke of Wellington. Now a sharp turn to port and we slip down the dark reaches of Grosvenor Place to Grosvenor Gardens, there a short dash through the murk brings us to Eaton Place and "home."

That night I went to bed with the firm conviction that Whistler's Fogs were preordained for the especial benefit of artists and the delight of tourists. That transient gloom, bringing out the beauties and mysteries of the city's streets and buildings as nothing else could, certainly held no place in the list of common nuisances incident to huge gregarious settlements such as London on the Thames. No, sir!

Alas and alack! Oh, my firm conviction! Next morning when I arose London was in the penetrating embrace of a "pea soup" fog! And, dodrotted nuisance, that combination of drizzle, smoke, and soot hung on for three days. It covered all outdoors and filled all the buildings; we smelled it, we breathed it, we ate it. With that example of dark-brown persistent fog in my eyes, in my lungs, and soaking through my heaviest clothes to my skin, I knew what the Cockney seaman becalmed in a dense fog off Sandy Hook meant when, asked if he didn't think it was *some* fog, scornfully replied: "Well, as for that; it may be good enough for this bloomin' blawsted country, but it's not like what we 'ave at 'ome!"

At the end of the second day's laborious consumption of atmospheric mush, I groped my way homeward, where, the fireplaces being useless, and thus the house chilly and reeking with moisture, I determined to retire forthwith to seek what comfort I might before the trials of another "pea soup" dawn. Once in my room, I hurried on my pajamas, threw back the bed coverlets, and dove in. Whereupon, and immediately, my right tibia, thinly clad with goose-pimpled skin, and my left patella came in contact with what I hastily concluded to be a pile of loose, but red-hot, builder's brick. Closer inspection, however, revealed the obstruction to be large, twin, stone hot-water bottles, well filled and piping hot, evidently placed in my bed by the kind-hearted maid in an effort to dry it out and make it less like a refrigerator.

On the third day, without a moment's warning, a mighty rain squall suddenly cleared the atmosphere. As the sun shamefacedly turned its attention to drying off the mildewed city, I turned my bedraggled way toward Charing Cross Station bound for Paris, shaking the soot of Whistler's London from my trousers cuffs as I did so; I was done with fogs, stone hot-water bottles, and—soot.

Yet, as I am a truthful sailor, I was back in London in less than 10 days. Despite its "pea soup" villainies, its interminable streets, its dingy shops, its cabbages, Brussels sprouts and artichokes, its mutton, and its generally despicable winter climate, I had to go back. Yea; I was even willing to eat my share of the 300 tons of soot which falls each year on that square mile of London in which I might chance to be—for I love Whistler's London.

"Of Usurie": Told in the Quaint Original

When Interest Was a New Thing in Anglo-Saxon Life, It Was Challenged

By ROGER FENTON,

Bachelor of Divinitie, London, 1611, A. D.

The Crowds That Came to Hear Him.

VERELY by their coming there should be great hope; for they resort in great multitudes to heare these points discussed in pulpits. They suffer us to cast the net over them; but alas they runne themselves so deep in the mud that it cannot get under them to dragge them out. Sonne of man (saith God to Ezekiel) they come unto thee as people useth to come, and my people sit before thee, and heare thy words, but they will not doe them; for their heart goeth after couvetoussnesse . . . . The gaine of usurie is a sweete gaine without labour.

Usurie, overplus for any loane whatsoever, is an impiety. It is an ungodly gaine. It is an unjust gaine. It receiveth gaine without labour; cleere gaine without cost. It is not within the law of God or nature. It is and ever hath been of ill report; and therefore among Christians unlawfull.

Law of England Forbids, as Does Church, Usury.

Our statute law now in force simplie forbidding all Usurie, or overplus for any loane whatsoever, being a wholesome and good law without exception, is to be obeyed by vertue of God's law. We of the Clergie stand bound to studie and teach the people the Civil and Canon lawes of our countrie, as well as the law of God.

Alas poore simple soules, who have received it by tradition I know not how, and do verily perswade themselves, that many reverend Divines have in their writings defended "ten in the hundred" (ten per cent) to be very lawful. It is and ever hath been of ill report, Authoritie is so strong against the lawfulnesse of Usurie, as that no man of modesty but will pawse and make question of it.

Men Not at Liberty to Take Sides on Usury.

Charitie, Justice, Pietie, Nature herselfe; the lawes of God, and of men; all authoritie ancient and moderne, joyning their forces against the Usurer, how can hee stand, environed with such a cloud of witnesses; or justifie his conscience against the day of triall?. . . . Take notice therefore, Christian . . . .I beseech thee, that thou do not mistake us (the clergy), and deceive thine own soule. That thou maist not mistake, I have laboured to be as plain as I can. Looke into the Prophets, and they ever combine this sinne of usurie with the transgressions of the Morall law in the highest degree, with lying, backbiting, deceit, wrong, briberie; Psalm 15. With idolatrie, oppression, adulterie, crueltie, unmercifulnesse to the poore, bloodshed and murder; Ezek. 18. With the profanation of holy things, with the abomination of uncleanness, with the unnaturalness of incest; Ezek. 22. Usurie, saith Saint Basil, *is placed among the greatest abominations,* all of them transgressions of the Morall law.

Matters Not Who Pays Usury, It Oppresses Poor.

Usurie is absolutely forbidden without respect of persons;. . . . though the poor only were mentioned in the first, because none but they did then borrow, notwithstanding this intent of the law is to be extended, even as usury shall extend itself to all persons whatsoever . . . . Personal difference cannot distinguish lawful and unlawful usurie. It was not in the meaning of God in his law to make . . . . personal limitation of lending to the poore only, seeing that by this kind of loane even to the rich there may be biting and oppression in great measure . . . . To lend rich men to enrich themselves more, is to powre water into the sea, for he will gaine double or treble at the least, and some bodie must pay for that, who cannot well spare it. Besides, hee doth shuffle thy stocks amongst so much wealth of his owne, thou canst not guess which way it goeth, or how it is employed; which being thy goods thou must answer for, if thy care be not as great for the good employment of thy money, as it is for the sure payment thereof.

The Sin of Usury Is Its Biting.

They who are caught to live securely in the fear of God upon usurie; can they tell when, whom, or how many their usurie doth bite? Nay can the wisest of them tell? For if the borrower be bitten, he had best keep his owne counsell, and set his best face upon it; otherwise if the Usurers do once smel him to be downe the wind, he shall seldom find them within (in). Can they tell when the Common-weale (commonwealth—the social organization) is bitten? Can they discern how many poore people shall pay a pennie in the pound dearer for them and their fellows? No, no, usurie walketh in the darke, it biteth, few know where or how. Only thus much in general we must needs know, that the borrowers upon usurie cannot afford their ware so good cheape by nine or tenne in the hundredth, as if their flocks were free; and yet must they needs sell as the market goeth. Therefore if there be not a sufficient number to raise the market price, and so cast the burthen upon the people, they themselves shall feele the weight of it. To make this more plaine by the most accustomed and moderate usurie of these times: If money be lent to spend upon necessaries, there is no manner of question made, but the borrower is forebitten in paying usurie, when he hath spent the principall. If it be lent to lay out for gaine, then must the borrower first be sure of so much cleare gaine, as will pay the use. Many honest tradesmen will confess, that if they could with their owne free stock raise the like gaine one time with another, that the Usurer doth with his monies, and with the like securitie of the principall, they would thinke they had made a very good market, notwithstanding all their care and travell (labor).

Usury Undermines the Commonwealth.

Gaine must be raised by the borrower to pay the Usurer; and over and above he must exceed this gaine, because this gaine is none of his. If the borrower do exceed the Usurer's gaine . . . . I demand then who payeth?. . . . . Who but the Common-weale? . . . . The Common-weale must needs bear the burthen, and especially the poorer sorte, who buying all by piece-meale at the lefthand, must be forebitten, though they know not by whom. One of the biting dogs which pincheth them fore, is usurie.

Usurers in a Plea for the Commonwealth.

The first (excuse) which offereth itselfe in these usurious dayes, is custom and example . . . . Seeing Usurie very much practised of all sorts . . . . men who bee not only earth-worms and meere worldlings; but men of very good respect amongst men, for their honest dealing; seeming very religious men, & zealous for the Gospell of Christ; those whose tender consciences will sometimes rise at very small offense. . . . If Usury were so damnable as some suppose, these good men, our special friends, would never suffer our soules to sleepe so securely in such danger. (Possibly) our sluggish modesty (as Divines) in being over silent . . . . taketh away the sense of sinne.

Our second motive ariseth out of pitie and humane consideration towards some persons, who have stocks of money, but want skill or power to employ the same. *This affection was the first hatcher of an Usurers' apologie* amongst exiles in time of persecution, which is now also applied unto Orphans and Widowes in times of peace . . . . Since God hath given in charge so often in Scripture to provide for the fatherlesse and widowes; is it not a safe way by this means to allot them a certainty for the use of their moneys, their principall being preserved; they maintained by interest; *and the Common-weale to enjoy both the moneys of them who want skill, and the skill of them who want money?*

Fenton Bares His Breast to Deal With This Plea.

If men shall degenerate as fast the next age, as they have done within the memorie of man; we shall have a deluge . . . . of enormities, not to be named amongst Christians . . . . For the practice (of usury) by the better sort . . . . thou mayest bee misinformed concerning these men. They doe not know what they doe. Luke 23:34. *For I verily perswade my selfe in my soule, had some of them knowne how unlawfull and dangerous a practice usurie is, they would never have ventured their soules upon it.* But as others are by their example, so were they by the example of others led into this common error . . . . *Mammon* is subtill to beguile you . . . . Be diligent or take counsel in religion . . . . desire no less securitie for your conscience in this question of usurie, than you doe for your principall in the practice of it . . . . Neither let our silence (as clergymen) incourage any to practice this sinne . . . . *We are loth to take Nathan his office upon us and say, Thou art the man.* 2 Sam. 12:7. Give us incouragement to deal plainly, sincerely and directly with your consciences. If we be over soft and indulgent with you in that business, take no advantage therefrom to the hurt of your soules; men of the best profession will be men, and not Angels.

Fenton Knows No Divine in Printed Defense of Usury.

And for your particular resolution in this particular, let me observe unto you, that upon the best inquirie that I can make, I find not any one Divine, new or old, of what religion or sect soever, who hath ever passed the press in this point . . . . I did think at the first that I should have found some; and some I have found who doe coast over neere upon it . . . . If any man therefore shall take you aside, as Peter did Christ, Matt. 16:23-24, to savour your dealings in this kinde; suspect that whispering to savour not of the things that are of God, but the things that be of men.

Widows and Orphans the Last Pretext for Usury.

The world thinketh usurie the best and safest way for Orphans and Widowes; because it doth secure them most from casualties, which might befall their flocks and estates, by act of God or man. The wisdom of God is contrariwise, that the widowes and orphans should most of all cast their care on God; because he careth most of all for them. But of all practices usurie doth most withdraw them from dependence upon God's fatherly providence, which best seemeth their condition . . . . It was so far from God's meaning, that in the very same place where hee maketh a law to safeguard Orphans and Widowes, presently and immediately upon it, is annexed the law against usurie.

Woman's Conscience on the Subject of Usury.

I write unto you widowes, who profess your selves now in your latter age to leave the world, and betake your selves to God, heare sermons, read your Bible, and live upon usurie: tell us in the name of God, where you learned thus to join God and Mammon together? . . . . I will suppose that your husbands in their life time did themselves imploy their stocks in honest and lawful trading . . . . Since their decease during the time of your widowhood, by this trade of Usurie, divers of you have attained unto far greater wealth than your husbands themselves ever could. This you cannot denie to be most true . . . . Is it not strange that a woman not able to manage her owne estate, should thrive better and with greater ease and security than her husband with the same or better meanes ever could? If this came by any extraordinary blessing of God upon you; I would lift my hands to heaven with you, praising God in his wonderful works. But if it be knowne to come by the ordinarie trade of Usurie, I would suspect that not to be of God.

Give me leave to deal plainly with you . . . . How do you know who is oppressed or bitten by your gaine? You will say that you commit it into the hands of such as you hope to be honest and conscionable men: for they keepe touch *and pay you your money*: They be neither ingrossers (monopolists), nor forestallers, nor oppressors; nor unreasonable gainers; but honest and religious men, for they deal honestly, and pay you your money . . . . Dare you trust them with your soule, in that wherein your selves stand answerable to God?

Fenton Addresses Commonwealth, Utters Prophecy.

The Common-wealth . . . . being a great bodie, is able to bear many dogges, before she need to complaine; she knoweth not well of whom to complaine; feel the wound in time she must. Usurie perverteth justice in every way. The Common-weale, and the poore people, *may rue it in time, that ever the least usurie was left unpunished;* for their purse in the end must pay all . . . . For the Common-weale . . . . this is obvious; that it is not good for a hive to nourish drones . . . . Bullinger most confusedly taketh and mistaketh usurie for all commerce, in rents, revenues, bargaine and sale, merchandizing, & c . . . .

The Commonwealth Upon the Sea of Usury.

Put all these *Ifs* together, and here is a peece of Usurie which was never practised since the world stood, nor never will:—*If* it be demanded whether it bee lawfull to take interest for the use of a loane of money; answer is returned by those supposed Patrons of Usurie, that for aught they can see, it may be lawful so to doe; *if* we make no trade of it, but once or twice upon occasion, and use it not . . . . *If* we take it not of any who by poverty is urged to borrow; *if* the taking of it doe not in any waies hinder the free loane to him that hath needed; *if* the interest be but *halfe* the borrowers gaine at the most: *If* we looke that the Common-weale be not bitten or prejudiced thereby. *If* our Usurie exceed not that which the lawes doe tolerate where we dwell; *if* the borrower besprinkle his creditor with some part of his increase, rather out of his voluntarie thankfulnesse, than by way of exaction: *If* the lender be content to beare part of the borrowers losse, as well as his gaine: *If* in case the principall doe miscarrie without the borrowers fault, wee be content not only to remit the principall with the Usurie but to lend him afresh . . . . Put all their limitations together, *they agree upon no Usurie at all.* (That is, together they forbid and prevent usury.)

Cities and Corporations Force Usury on Country.

Cities and corporations have drawne a necessitie of this sinne upon themselves by three strong cart-ropes of iniquitie (Isa. 5:18). First, those that be well able to lend and will not, have forced many to pay usurie. Secondly, an insatiable appetite to compass great matters, doe take up great summes of money; (so) that no money is to be spared for such as bee borrowers indeed . . . . That is the Countrie woe. Thirdly, falsehood and deceit . . . . These three cart-ropes, not easily broken, *have drawn a necessitie of usurie upon Cities.* Necessitie is lawless. If Usurers can therefore put on that coate, it will be armour of proofe against all argument; against all statute of law both of God and man. They doe pretend that the state of the Citie cannot stand; that traffick cannot be maintained; that tradesmen cannot live without it; (that) then verily it was never God's meaning to lay so heavie a yoke upon his people in forbidding that which is so necessarie.

Usury Is Proof Trade Carries Too Much Sail

I demand first of those tradesmen, who cannot live in their trade without taking up at interest: Is their meaning that they cannot live in that fashion they doe; maintaine their wives in those fashions that they doe; drive their trade to that height which they doe? If this be the case, the answer is easie: It may be God would not have them carry so great saile as they doe . . . . Whosoever hath for his ground that he *will be rich,* must insnare his conscience with many necessarie evils, whereof usurie is one. If it bee propounded, that trade and commerce between man and man cannot be maintained in this Citie without borrowing and lending; that is granted. Common societie, saith S. Basil, doth require it. But admit this dogge (usury) were tied up; would rich men prejudice the Common-weale by imprisoning their monies in their coffers, think you? Verily, if usurie were not, men would tenter their wits, either in trading themselves, or imploying others; rather than so current and necessarie a thing as money is, should take rust in these peaceable and getting daies. *He, that increaseth his riches by usurie and interest, gathereth for him that will be mercifull to the poore.* Prov. 28:8.

Let us aske counsell of the ancient and holy Fathers of the Church. The way of these ancients, next to the

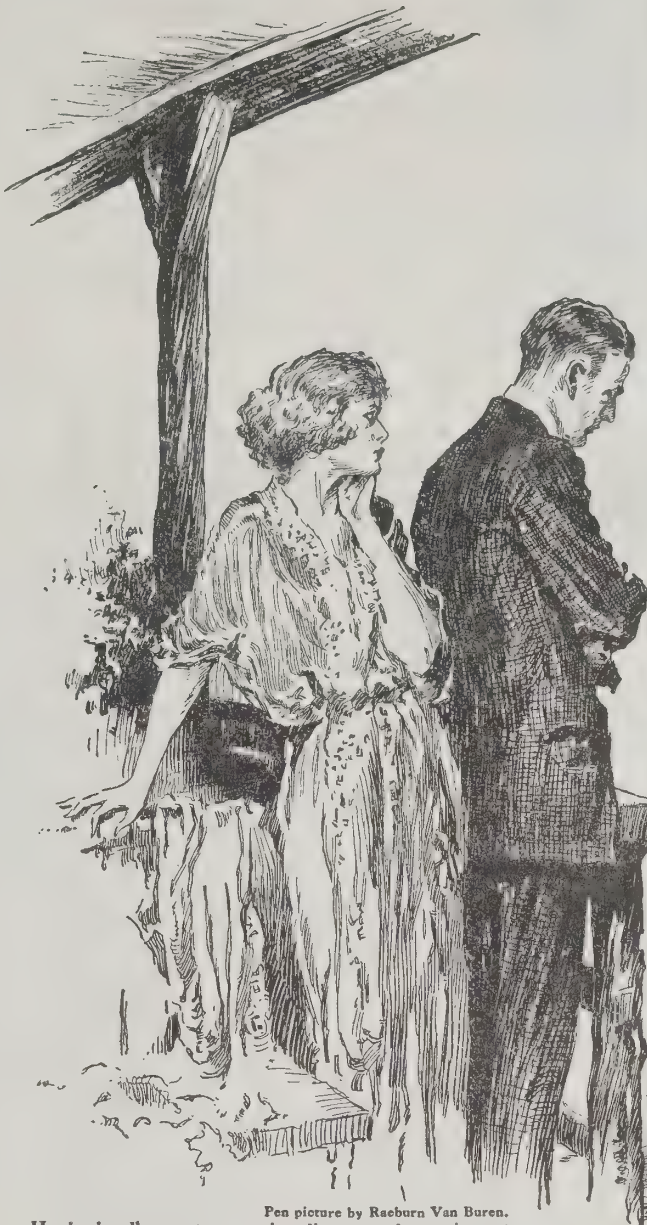
(Concluded on page 14)

Reminding the World How Short Its Memory Is

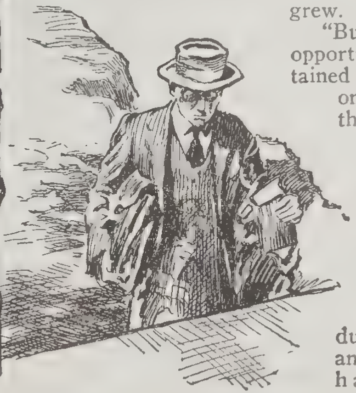
Peter Clark Macfarlane Found the Younger Generation Incredulous That Autos Were Ridiculed Just 25 Years Ago, So He Wrote "Man's Country," a Novel About Pioneers

By LEE BROWN

PETER CLARK MACFARLANE.



Pen picture by Raeburn Van Buren.
Her husband's secretary was invading even the rustic spot to which they had fled for their honeymoon.
"Did I marry a man, or a business!" exclaims the bride.



"'DID.'

'Didn't.'

'A wagon without any horse! It rolled right by me—lickety split.'

'You're a darn liar!'

'Bim!'"

A rousing fight between the two half-grown brothers stirs up a lot of dust on the street of suburban Detroit in which the youngsters live. The period is the middle nineties.

A popular novelist couldn't have got away with that opening to save his neck, 20 years ago. But Peter Clark Macfarlane, one of the most recent arrivals in the "best-seller" list, is getting away with it handsomely this year. It's the first half-dozen lines of his new business novel entitled, "Man's Country."

Twenty years ago nobody would have been in the least surprised at one of Peter C. Mac's juveniles calling the other a liar because he claimed that a horseless wagon had passed him on the road. The readers would have remembered how incredulous they themselves had been just a few years before when they first heard of—and stumbled over the pronunciation of—those newfangled contraptions called automobiles.

Pete's opening would have lacked what the book publishers call "surprise value," at that time; but it's going big now. The pages that follow it, moreover, are full of other incidents that wouldn't have had any surprise value at all even as recently as 15 or 16 years ago. One character, for instance, a pioneer automobile manufacturer, insists that his rival has just about ruined the market by flooding the country with so many as a thousand cars in a single year.

While elsewhere: "Holy Zacharia!" exclaimed Mr. Morris. "You're selling 'em faster than we can make 'em. About 8 or 10 a month is as fast as we can turn them out."

All of which goes to show that Macfarlane, who was well known as one of the best interviewers in journalism before he became a novelist, guessed right when he decided that the American public would be amazed to discover how quickly it forgets.

"What gave you the idea?" I asked Pete after I'd heard that reviewers were quarreling about the book, wholesalers reordering it, and preachers finding sermons in it. (Macfarlane himself was once a preacher. In his novel he devotes himself purely to romance. Infallible means that, of getting a preacher's name on the tip of the public's tongue!)

"Oh, it's been simmering a long while, as most ideas do before they reach the public," he said. "The newspapers and magazines used to keep me traveling around for interviews so much that the drummers wondered what line I was handling. One group of interviews I gathered over a course of years was with various pioneers in the automobile industry.

"Then I began writing short stories and, about the same time, was sent over to France to get interviews, articles, and stories about the war.

"One lovable old cavalry officer sized up the situation there with an exactness that might have made him a good lawyer if he hadn't loved horses too much. I asked him why on earth he looked so infernally gloomy.

"'Why shouldn't I be,' he demanded, gazing resentfully at the motor cycle side-car assigned to him for personal transportation purposes. 'I'm nothing but an out-of-date horse soldier out of luck in a gasoline war.'

"And it was the gospel truth; a 'gasoline war' it was with a vengeance. So much so that the giant lorries thundering along the ancient Roman roads of France, single strings of them stretching for miles and miles out of sight, came to be taken for granted as though they had existed always. Men gave them pet names, and talked to them; and they in turn behaved in emergencies almost as though they understood.

"Could it possibly be that these metal mammoths, and the swift, graceful, high-powered staff cars, were alike descended from the spindly 'horseless carriage' at which people had jeered just two decades before? These, and the sturdy little light cars that burned up the roads in the farthest-flung areas of flying danger? And the couriers' restless motor cycles that flashed in and out among all the rest with the agility of things alive, and that were sometimes driven in mad dashes across open fields that would have felled half a cavalry regiment?

"It seemed so incredible that I myself could hardly believe the very things I had reviewed in print but a year or so before. I tried some of them out on the youngsters. In the backs of their minds, of course, was the knowledge that the automobile was of recent origin, but they simply couldn't believe that their own fathers had called the inventors crazy. Somebody might have, somewhere back in the distant past, of course, just as Columbus was originally called crazy; but the generation just a little ahead—that was incredulous.

"For the time, I had to pack these simmering meditations away in the back of my own mind. There was no opportunity or place or patience for their careful rounding out then; things and thoughts and life were too snatchy and temporary and vivid, the short story was their logical medium. There were, for instance, such men as old Dan Daly, a veteran sergeant of marines, to tell the American public about. And Dan fit into a short story like a hand in a glove. He looted two sacks of green cabbages and a case of canned tomatoes from the chow wagon of the company next to his own, down on the Marne, and his many admirers confided that he was the most notorious thief in the American Army. I looked him up, and found something else than a thief in this naïve old fellow who a few days later was to be limping around with a collection of machine-gun bullets in his gristly body. I saw the sheer courage, the sly humor, and the real morality of old Dan, who stole only for the men whom the government had committed to his charge, and mostly only the stuff that that same government had supplied but had somehow misdirected. Dan was an honest, a patriotic, a justifiable thief, and if I were still preaching I'd preach *on* him instead of *at* him. Out of the things he really had done and the things with which he might logically have followed them up except for his mishap grew 'Cross and Double Cross,' a *Saturday Evening Post* story.

"And there was the bright little patch of a story of one Edith O'Brien, of the Bronx, New York, who bobbed up in the blue uniform of a telephone girl in one of the back areas and, at the intersection of two typical streets so narrow that you wonder why the natives don't carry cowbells to ring as they approach corners, bumped squarely into a spic and span lieutenant who had been captain of the Princeton football team the year before. 'A Wire Entanglement' was the title into which they grew.

"But with peace came opportunity for more sustained threads of thought, on my own part and the public's.

"In Detroit I found out more about the automobile pioneers, and what had become of them. Practically all the original giants of the world's most gigantic industry are still living, and still dreaming and hammering those dreams through to breathlessly swift realization. Somehow, no end of authors drift to the Chautauqua platform, soon or late. Maybe it's the wanderlust, or the gypsy in them. In my lecture-making travels over the country I found that the youngsters who couldn't possibly make themselves realize how young the auto was, abroad, were no exceptions to the rule. It was the same in their home towns throughout the country.

"They were immensely interested in hearing the stories of the early struggles against popular ridicule of a score who had been able to envision the place that motor cars were to take in our modern civilization. There's romance, heroism, and tragedy all rolled together in their combined stories.

"Fabric for a novel? This? It was incredible that it hadn't been done before.

"Associating so much with the modest beginnings of the industry and the physical relics of the first models, I found myself feeling an almost fatherly regard for everything that chugged along on rubber tires. To others in the crowded streets they might be powerful and sometimes dangerous masses of machinery dashing in and out with the skill or carelessness of their respective drivers. But they seemed personally known to me; I had just been visiting with their grand-daddies.

"I crawled off into my quiet little California retreat and—'Man's Country' is my way of trying to tell the story to Main Street."

Macfarlane, according to some of the critics, has succeeded so well in transmitting his feeling of a personal acquaintance with the whole automobile family, in all of its brief generations, that the reader who stops in the middle of a chapter is in danger of disregarding the honk of approaching horns.

If he had stopped with the story of the automobile itself, however, his subject would have turned into a mere textbook instead of a novel. There'd have been none of the so-called "feminine appeal," despite the fact that, in the case of practically every one of the pioneers he interviewed, Macfarlane says he found there was a woman who helped and inspired.

Balzac described fiction as "the history of the private life of a nation." If that is true, it's understandable why the publishers feel that, in something over 999 cases out of a thousand, the justly famous "feminine appeal" is as necessary as a printing press. Besides, did you ever realize that 80 per cent of all the new novels of today are purchased by women? The wholesale book dealers have kept tab for years to help decide how many copies of each book to buy.

And so Macfarlane wove into and around and through the fabric of the story that which his lecture

(Concluded on page 12)

American Citizens Who Live Disfranchised

Washingtonians Once Had the Vote—But Also Had With It the Scandals and Graft and Governments That Politics Brings

By JAMES MARTIN MILLER

THE 437,571 people living in Washington, the seat of the National Government, do not have to bother about local or National Government, for they have no vote. They are the only Americans in this self-governing nation that have absolutely no voice in government. The City of Washington has the distinction of being the only municipality in the United States that has no mayor, board of aldermen or city council. While Washington is filled up with politicians, they never waste any time in making speeches to the inhabitants and telling them what wonderful things will be done "for the people if you will only elect me to office." Being powerless to vote, the people of Washington and the District of Columbia are spared all this. There is no city hall crowd, ward politicians, or heelers, in Washington.

The people of Washington can go about their affairs and need not devote any of their time to civic matters, the election of officers, the voting on bond issues, or any other matters of government for the city, the District, or the United States. Everything is attended to for the people here by Uncle Sam's Congress. The people of Washington and the District of Columbia have to take the kind of government Congress gives them. Government here is none of the people's business, that is the business of Congress. The people of Porto Rico, of the Philippines, of Hawaii, of the Virgin Islands, and of Alaska, have a considerable degree of self-government, but the people of Washington have absolutely none. There is "taxation without representation" in the District of Columbia.

Now, this seems despotic, that such a state of affairs could be right at the very fountainhead of this great and free, self-governing nation. But the situation is not so terrible as it may seem. The Washington system of governing a city has its advantages and the people, even though denied any voice in government, are contented and prosperous. Oh, yes, there has been an agitation in Washington for years to give the people the vote, but the campaign does not seem to get very far.

Gave Up Franchise to End Graft

EVEN right here in Washington there are people who do not realize that Washington, and the District of Columbia, once had a mayor for the city and a governor for the territory, and that the people voted, at one time. But scandals of graft, big bond issues, political bosses, with which we are familiar in practically all our American cities, enveloped and agitated Washington and the District of Columbia. Yes, city hall politics, American style, was strong in the saddle in Washington for a few years. It is unfortunate that certain cities of the United States cannot find refuge from their political corruption by an appeal to Congress as did the District of Columbia and the City of Washington. They were perfectly willing to give up the voting franchise, to save beautiful Washington from continued disgrace and inevitable disaster. Then, too, the conditions in Washington are very different from those in any other city, owing to the extensive enterprises of the government here.

It would be misleading to give the impression that Washington is administered economically, for it is a very expensive city to maintain. There is no city in the country that is, necessarily, so costly to keep up. The very plan of the city makes it so. The streets are wide and there are innumerable parks and squares, with their monuments that are national in character, and are expensive in the upkeep. The District of Columbia pays 60 per cent of the expenses of the district by local taxes and the United States Government pays 40 per cent. So it will be seen that every taxpayer of every state helps to support the District of Columbia. The Federal Government pays no taxes on the government property in Washington. It is estimated that the value of the Federal property, buildings, parks, and so on, amounts to about 40 per cent of the total valuation of property in the District. This is the basis on which the government pays 40 per cent of the expense of the District government. The cash receipts of the District of Columbia, for the fiscal year ended June 30, 1922, amounted to $23,104,798.60, made up as follows: Revenues of the District of Columbia from taxes and miscellaneous sources, $13,917,005.62; amount paid by the United States on account of its proportion of appropriations, $9,187,792.98.

District Folk Treated Well

UNCLE SAM has treated his subjects in the District of Columbia, to whom he has denied the vote, very liberally indeed. He has enabled them to have a general fund to the credit of the District of $7,579,677.58 (1922) and to the credit of trust and special funds of $562,127.72. In 1874 when the people had territorial and municipal self-government a 50-year 3.65 bond issue of $15,000,000 was made. While these bonds were not due till August 1, 1924, they have all been paid except $156,234.38, and the District has no other form of indebtedness. With several millions to the credit of the District, beyond this small indebtedness, it may be said that Washington is, practically speaking, the only city without a bonded debt. For the fiscal year, 1922, the government of the District of Columbia cost $22,977,411.07. This is about $10,000,000 more than Cincinnati, Ohio (a city of similar size), cost for the same period.

George Washington was very active in locating a permanent home for the seat of the government. The Congress of the Revolution first met at Philadelphia, September 5, 1774, and continued to hold sessions there until December, 1776, when, in consequence of the approach of the British Army, it adjourned to Baltimore, where it met on Friday, December 20. On February 27, 1777, it adjourned to return to Philadelphia. It continued to meet at Philadelphia until September 14, 1777, when it moved from Philadelphia to Lancaster, Pennsylvania, and on the 27th of the same month to Yorktown, Pennsylvania, where it assembled September 30, and continued to meet there till June, 1778. When General Washington's letter was read in Congress on June 20, stating that the enemy had evacuated the city of Philadelphia, Congress again returned to Philadelphia on July 22, 1778. On January 11, 1785, Congress met in New York, which was the capital for more than two years. There was great rivalry between several cities, each of which wished to be selected as the permanent capital.

George Washington was the principal force which decided that not one of the contesting cities should be selected. The entirely undeveloped site, except for farms, was selected. Washington himself drew up the contracts with the settlers agreeing, on the part of the government, to pay them $66.66 2/3 an acre for the land. On December 23, 1788, Maryland, in addition to the land grant, donated $72,000 and loaned the struggling government $250,000 more for the erection of buildings. Virginia made a gift of $120,000 for the same purpose.

The District of Columbia is situated on the left or eastern bank of the Potomac River, at the head of navigation of that river, 106 miles from its entrance into Chesapeake Bay and about 185 miles, by way of that river and bay, from the Atlantic Ocean.

The center of the District is 1,305 feet north of the Washington Monument, and 1,579 feet west of it. It contains 69.245 square miles of area, of which 60.001 square miles are land, 9.244 of its area being water.

The District of Columbia consists topographically of an urban section named the City of Washington, and of a suburban and agricultural section which contains a number of unincorporated villages and a populous area, separated from the city by Florida avenue, the Eastern Branch (Anacostia River) and the northerly and westerly boundaries of Georgetown, now a part of Washington.

It was originally divided into two counties by an act of Congress approved February 27, 1801, but the portion of it which was derived from Virginia was retroceded to that state on September 7, 1846; so that the part of the District which was derived from Maryland and named the County of Washington, is the only county subdivision and still retains that name.

The boundary line between the District of Columbia and Virginia is the high-water mark on the western or Virginia shore, of the abutting Potomac River. The boundary line on land between the District and Maryland is marked by sandstone mileposts one foot square and two feet high, and numbered from one to nine on the series of each front.

First Called Territory

THE first official name of the District was given by the original commissioners September 9, 1791, in their statement that "We have agreed that the Federal District shall be called 'The Territory of Columbia.'" It was incidentally called the District of Columbia in a number of acts of Congress, but not specifically so named by law, until the act of June 11, 1878, which prescribes "That all the territory which was ceded by the State of Maryland to the Congress of the United States, for the permanent seat of the Government of the United States, shall continue to be designated as the District of Columbia."

Georgetown was first named by the act of the General Assembly of Maryland by which it was incorporated on June 8, 1751. Its name was not changed until February 11, 1895, when Congress consolidated it with the City of Washington and discontinued its name by an act of that date.

The City of Washington was first named by the commissioners on September 9, 1791, but they had no statutory authority to name it. The city was never legally so named until an act of Congress approved February 21, 1871 did so. Its boundaries, however, have never been defined by law.

The first administrative officials of the District of Columbia, and of the City of Washington, were the commissioners appointed by the President under the acts of July 16, 1790. They were succeeded by an officer styled "Superintendent" whose position was created by an act of Congress, approved May 1, 1802.

The City of Washington was first incorporated by an act of Congress approved May 3, 1802, providing for a mayor appointable by the President of the United States, and a city council elected by the qualified voters. This form of government continued until the act of Congress of May 4, 1812, which provided for electing the mayor by the council, but that form was changed by the act of Congress of May 15, 1820, which required the mayor, as well as the council, to be elected by its qualified voters; but which was revoked by the act of February 21, 1871, that created the territorial form of government for the entire District of Columbia.

Georgetown, until its charter was revoked by the act of February 21, 1871, above cited, also elected its mayors and councils by the qualified voters of the town, except during a few of its earlier years when the council appointed the mayor.

The residents outside of Washington and Georgetown, after the District of Columbia was established, had no right of suffrage, but their local governmental affairs were first administered by a body called "Justices of the Levy Court," and later by a "Board of Commissioners of the Levy Court" created by act of Congress. This body was abolished by the act of Februray 21, 1871.

The act of February 21, 1871, which abolished the charters of the City of Washington, Georgetown and the Levy Court, created a new municipality named the District of Columbia, the officers consisting of a governor; a board of public works, composed of the governor and four others; a secretary; a commissioner of health and a council of 11 members, all of whom were appointable by the President of the United States to be confirmed by the Senate.

The council was a branch of the legislative assembly, which also embraced a house of delegates consisting of 22 members who were elected by the qualified voters of the District, and a delegate in the House of Representatives of the United States, who could speak on District matters but not vote in that House, and who was elected by the voters as were the members of the house of delegates.

Form Settled in 1878

THIS form of government continued until June 20, 1874, when it was abolished by Congress and a temporary form of government for the District of Columbia created by an act of Congress on that date, consisting of three commissioners appointable by the President of the United States and confirmable by the Senate. They were assisted by an officer of the Engineer Corps of the United States Army, detailed for that duty. After an experiment of four years Congress adopted the commission form by the act of June 11, 1878, which, with some minor modifications suggested by experience, is substantially that now operating.

Negroes were excluded from the suffrage until January 8, 1867, when Congress vested Negroes with the right to vote, but this was taken away from whites and blacks alike by the act of June 11, 1878. Negroes comprise one-third of the population of Washington.

When the charters of the City of Washington and of Georgetown were abolished on May 31, 1871, they were in debt as follows:

Washington	$2,966,693.27
Georgetown	261,463.37
Levy Court	28,825.84
Total indebtedness	$3,256,982.48

When the territorial form of government was abolished, the debts it had incurred in extension of its contracts, up to July 1, 1878, amounted to............$22,106,650
which was subsequently increased by............ 1,254,050
making a total debt of $23,360,700

The election of April 20, 1871, was intensely contested, as it was a crucial struggle between the "progressive" element represented by Governor Alexander R. Shepherd and the board of public works, who were opposed by the conservative property and political elements, which were appalled by the revolutionary program of municipal improvements which that board proposed, and the conservatives were strongly opposed to Negro suffrage.

Had Two Governors

DURING its history with a territorial form of government, the District of Columbia had two governors, Governor Cook and Governor Shepherd. President Grant appointed Governor Shepherd and stood by the governor in all the furious attacks made upon him in the stormy political strife that prevailed in the District of Columbia when the people had the vote.

The attacks upon Governor Shepherd became so fierce that he left the District after Congress had killed the territorial form of government and established the present form; three commissioners appointed by the President; a District of Columbia committee, in each the House and Senate, was created and passes upon appropriations, schools and all matters pertaining to the government of the District and the City of Washington. There is no city in which the people of North, South, East and West meet and commingle as they do in Washington. Every accent in speech, and the colloquialisms of every state are heard here. Practically every nationality and country of the world is represented in Washington in the 34 embassies and legations of foreign countries. But Washington is distinctly an American city in the make-up of its population. Practically all the officials, government clerks and employes are American-born and come from every state.

There's Wealth in the Farm Woodlot

How a Much-neglected Spot Can Benefit Both Country and City Folk

By FRANZ A. AUST

Associate Professor of Landscape Design, University of Wisconsin

NEARLY every twentieth person in the United States is dependent upon the forest and its products for his "three squares a day." It means 5,350,000 folks. That's how deep a shortage of timber material would strike into this country's industrial life. Labor employers in the woodworking trades everywhere realize that they are facing a timber shortage. No wonder these industries are continually demanding the re-foresting of the National Forest areas. A wood famine means a national calamity!

Use substitutes then, says the Cheerful One. But in spite of all the iron and brick and steel and concrete which are supposed to take its place, we are using twice as much wood as we were 50 years ago. This is because there are so many new uses and demands for the products made from trees in connection with the other materials.

But what has the little ten-acre woodlot on the average farm to do with a crisis of this sort? Up to the present time very little. There is more land in farm woodlots today, however, than in all the national forests put together. Farm woodlots as a whole are producing only one-tenth of the timber they could produce. If they were three-fourths fully stocked, they would yield more each year than all the timber which is cut annually in the nation's forests. And then the land not in trees, but most suitable for trees, has not even been mentioned.

Take New York alone. When its great expanse of land is classified, only one-half of it can be called true agricultural land. The other half is classified as "real forest land," or land which is better adapted to the growing of trees than to the growing of cultivated crops. If these acres were properly planted to timber and well managed, they would yield for all the years to come most of the timber needed for the woodworking industries of the state. It's the state's job to look after 12,000,000 of those acres and to see that they are forested. But 4,000,000 acres, one-fourth of the whole, are found within the boundaries of individual farms!

Massachusetts has one-fifth of her area classified as "idle land." Most of this "idle land" would grow trees better than anything else. There are 1,000,000 acres of this in the state, and the Massachusetts Forestry Association through action of the commonwealth is trying to bring back the forests to these acres. Some of this land on private farms has already been forested, and the timber will soon be available for use. Individuals will presently be helping to produce the lumber which the state now has to import for her industries, and at the same time the profit of their own farms will be increased.

How much does the woodlot increase the value of a farm? About a generation ago one-sixth of the profits of the farms in New Hampshire came from the farm woodlots. Recently in a middle-western state an appraisal of a farm was made without considering the value of the timber in the woodlot. The woodlot was rated at $50 an acre; the rest of the farm at $150 an acre. A little later a Federal bank official made a second appraisal including the woodland. Based on the cruiser's report for timber which was merchantable, the whole farm was valued at $200 an acre!

The average farmer, it is stated, uses about 2,000 board feet of lumber every year. That's about two cords of wood, besides his fuel. If a woodlot is producing as it should—one cord a year for every acre—a farmer with a 10 or 12-acre woodlot will have sufficient timber to supply his needs and a goodly amount to market besides.

Near one of Wisconsin's rivers a certain farmer has 15 acres of overflow land. It is rich bottom soil, but it is situated on one corner of the farm, and it is convenient neither for pasture nor for hay. Part of it is, likewise, too steep for cultivation. To make an ideal woodlot this farmer has planted mixed timber native to the locality—white oak, ash, birch, elm, maple—but he has also set aside a part of the land for a special variety—the walnut. This tree is particularly adapted to river bottom soil. To insure sound, sturdy growth in this climate nuts were planted instead of young trees, and these were placed in straight rows eight feet apart and six feet apart in the rows. This part of the woodlot is for future value.

During the war, the supply of walnut timber in this country was largely exhausted for gun stock material, and a scarcity is the result. Walnut as a wood for furniture is again becoming popular, and the demand for it among woodworkers increases year by year. In due time there will be marketable timber of great value on this river bottom soil. From the acres whereon a mixed variety of trees is standing, meanwhile, there will be plenty for all the lumber and firewood needed on the farm.

The farm woodlot! A necessity to the woodworking industries; an opportunity for profit to the farmer; a boon to the nation's agriculture; a beauty spot for the eyes of city and country alike.

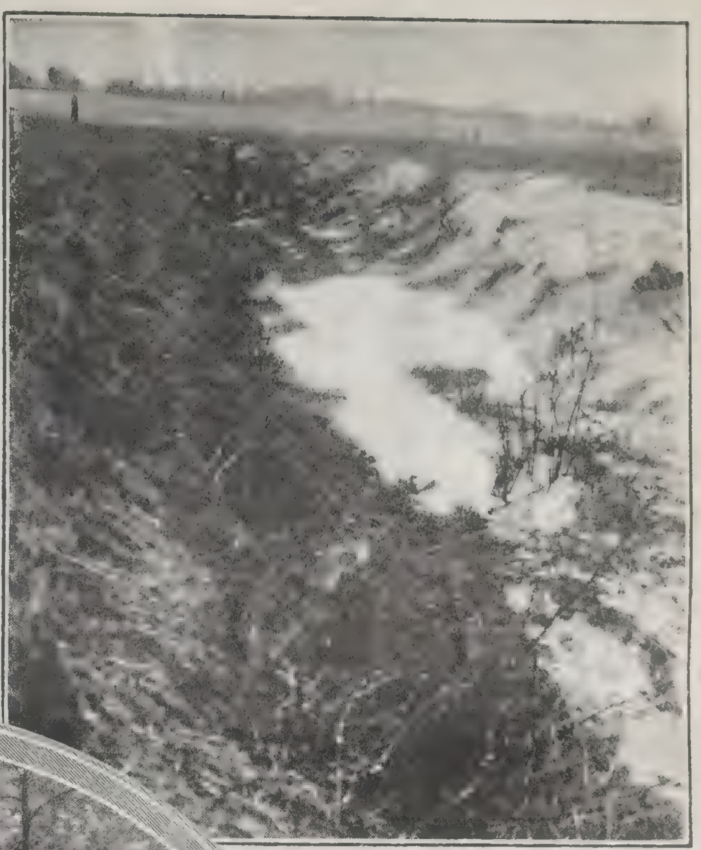
On another Wisconsin farm, Herman Ihde is renewing an old woodlot. He had a good stand of white oak to begin with, but stock had been allowed to pasture there, and very little new growth was the result. After a recent sleet storm broke down many of the old trees, he decided to replant. His first task was to take out all the trees which would not repair themselves. These were good for fuel. Next came the selection of proper trees to plant on high ground, and those which would bring best money returns. For this he chose sound native trees free from disease and insect attacks.

Mr. Ihde's farm is in the paper mill vicinity of the state. He chose, therefore, some fast-growing poplars to be sold for pulp wood. These will be ready in from eight to twelve years after they were planted. Basswood for which there are local markets, and which has 525 uses from spools to trunks, has also found place in this woodlot. Birch which grows quickly and is ready for use in 15 or 20 years was planted for future bolt wood. Then there were white oak and white pine to be ready for still later cutting.

This woodlot will sooner or later be ideal in other ways as well as in variety of trees. There will be enough trees of both fast and slow growth to shade the ground and to conserve the moisture. Growing shrubs of native variety will inclose the miniature forest and will prevent a too rapid circulation of air. Not only will plenty of moisture and proper air circulation further the growing of the trees; these conditions will act as a prevention against a woodland's worst enemy—fire.

Neither will other enemies of an ideal woodlot be harbored. Cattle and sheep and hogs and horses will have no admittance for pasture and grazing. And only the trees which are ready for market or for use each year will be cut. The "interest" will be used, while the "capital" remains intact.

Every farm woodlot well planted and well managed becomes a national asset as well as property with private value.



Eight years ago this land was a level field. Then the woodland on the ridge in the background was cut, erosion took place, and valuable land was ruined for agriculture.

It means much to a nation's agriculture to have the waste land on many thousands of farms producing the forest crop to which it is adapted, thus saving the more fertile soil for the production of food. There is the rough, the stony, the hilly, the swampy land, all well suited to tree growing.

In the lake states especially, there are millions of acres of marsh land. Wisconsin alone has in all an area of marsh land larger than the state of New Jersey. Some of this land is producing excellent cranberries; marsh hay, too, is a valuable crop on a portion of it. But many acres on private farms could well be planted to white spruce if near the paper mill section, to white cedar for poles and posts, to tramarack, also, for poles and posts and, with special treatment, for railroad ties. Both cedar and spruce are ready for market in 15 or 20 years from the time they are planted. These are good trees for northern woodlots. In the South, from Louisiana to Southern Illinois, cedar and cypress do well.

Few trees of foreign birth are of much value on American soil. Norway spruce is 20 or 30 years in growing to market size; it is easily broken by storms; and after 30 years it rapidly declines. Scotch and Austrian pines while faster growing at first need much protection and are short-lived. The European larch, on the other hand, is a good producer in this country, although it has as its enemy the dread larch sawfly. Larch trees are known to have become 22 inches in diameter in 28 years.

That hillsides be planted to trees on farms as well as on public land is of national importance. Thus can erosion be prevented, and valuable land can be saved from the scrap heap.

It is a grave matter that the taking away of trees from farm and forest has deprived the land of its great moisture reservoirs and has forced streams large and small to shrink and dry up. Of this the mighty Father of Waters is a striking example. Once the great forests on either side held the snows and rains to furnish it a huge volume of water the whole season through. Now that the forests are taken away, rains and melting snows swell it tremendously for a short time. But later, alas! the great Mississippi is reduced to a second-rate stream upon which large steamers cannot navigate. Where woodlots exist there is a protection from heat in summer; there is shelter for a whole countryside against cold, sweeping winds in winter. Every woodlot planted, every bit of woodland revived will be doing its utmost toward bringing back natural conditions so ruthlessly taken away.

Raising timber for industry and benefiting farming as a business are not the only objects in planting and preserving the woodlot. Even young trees 10 or 15 years old are beautiful to look upon, and every bit of woodland makes a charming setting for lake or stream border, or to relieve flat prairie land. The splendid wild creatures, too, which now have scarcely a sanctuary outside the great national forests, will find in the little woodland a safe place for a home.

Nation, state, and farmer must work together in reforesting America, so grave a problem is the necessity of planting more trees for the future. Farmers are the greatest owners of forest-producing land in the nation. This land would cover an area larger than Minnesota and Michigan and Wisconsin and Maine—200,000,000 acres in all! What a mighty responsibility rests with its owners! But it's a great opportunity, too. There's wealth unmined in the farm woodlot when it is properly planted and managed and measured and marketed.

When Mormon Pioneers Abolished "Interest"

Salt Lake City Issued Its Own Currency; Free of Bonds Until Recently

UNTOWARD were the prospects, and inevitable the hardships faced by Brigham Young and his followers when, in quest of a "promised land," a haven from persecution, they settled on the uninviting plain of Deseret. Upon that site there later rose one of the famous cities of the world, near the Great Salt Lake, the American Dead Sea, from which its name is derived.

The story of Salt Lake City and its peculiar application to present-day problems has never been made clear.

Who, for example, has heard that Salt Lake City has its own money—City Currency!

For 40 years the government of Salt Lake City and that of the Mormon Church were practically identical. Neither church nor state tolerated modern means of forced improvement and consequent waste; the policy of each organization was to pay as it advanced.

The burden of taxation which overwhelms most modern municipalities, due in large part to the mortgaging of the future to pay for improvements doomed to destruction or obsoleteness before paid for, the ever-increasing blight of bond-interest, had led to a study of the financial records of a number of representative cities, Salt Lake City among the rest. In the city auditor's report of the Utah capital a small item attracted attention. It was unusual, being one in the liability column of a table showing the city's financial condition, and read:

"City currency ....$3,003.25."

City currency? *Then at some time Salt Lake City had issued its own money!* Here was an interesting story. Inquiry followed, and the facts here given, derived from the civic and church records, are the result.

Based on Credit of City

READERS of THE DEARBORN INDEPENDENT are familiar with the story of the Guernsey Island Market, built without bonding. The Guernsey demonstration finds a parallel in the *City Currency* of Salt Lake City, in that the latter *enjoyed the use of its own money without paying interest,* and after a lapse of more than 50 years some of it is still outstanding, or, rather, a portion has not been presented for redemption and cancellation. It is now some three years since the city treasurer has been called upon to cash one of these notes, and it is probable the account has been closed under the presumption that the small balance is being preserved as souvenirs by the holders, or has been destroyed. At least, such disposition of the account was decided on a year ago. As souvenirs, of course, they are worth to the holder far more than face value.

The Civil War closed in 1865. In the same year began agitation of the building of transcontinental railways. Salt Lake City, although practically isolated from the outside world, began to feel the thrill of future possibilities. Money was scarce, credit facilities were not of the best, so the city began to issue its own currency.

The issue of 1865 proved of so great advantage to the community that it was repeated each of the following three years, the last issue carrying the total to $35,519.25.

This currency, while corresponding in terms to the monetary standards of the country in denominations, was based on the faith and credit of the city, and made a full legal tender.

Financiers estimate the power of money at many times the volume issued; that currency in circulation represents but five per cent of the volume of business transacted. If this be true, and it is beyond dispute at the present time, one may well speculate on the amount of good done in that day by such an amount of legal tender carefully turned into the channels of business. This article, however, does not speculate; it simply gives the facts and the story of redemption will indicate the use of the currency in business.

Of the initial issue of $7,989.25, at the end of 15 years, there were unredeemed $488. The issues of 1866-7, amounting in all to $22,250, were consolidated on the books, and in 1890, the unredeemed notes of the two issues aggregated $1,597.75. In the same year the unredeemed notes of the last issue totaled $919.50. Here, then, was a liability of $1,305.25, which was reduced by $2 on June 30, 1900, since which time no notes have been presented.

Like the Guernsey Island currency, the Salt Lake City issues were payable on demand, were a full legal tender for all debts public and private, within the municipal jurisdiction, were receivable for all public dues, and were canceled on redemption. It is not of record that any notes were presented except for taxes and other public dues, but that does not affect the lesson this story conveys.

How much of the greatness of this truly great city may be due to the fiat of its government in early days may some time be told, but it is certain that gold and silver had little part in it until half its life to date had been passed. Human labor, soil production, and a medium of exchange which the country's laws did not sanction, made the foundation on which the city has been built.

Nor was borrowing indulged in. The first public bonds issued in Utah, it is claimed, were to cover a territorial debt of $200,000, and were required by constitutional provision when Utah was admitted as a state in 1896.

The auditor's report indicates that the present-day bonding and borrowing fad has captured Salt Lake City, for of a tax rate of $10 80 per $1,000 assessment, the amount required for interest on bonds and sinking fund is $1.70. It would seem as if the old method were best, as there was not only no interest requirement, but there has been nearly 10 per cent profit in unredeemed currency.

Interesting as this statement is (and it is all that can be gleaned from the public records), there lies behind it the astonishing fact that Salt Lake City was started in a wilderness, under most unpropitious circumstances, and built up in a century of gold worship, *without the use of gold.* Located far from the centers of trade and commerce, on a soil that must be irrigated, without any means save faith and industry, this city rose Aladdin-like, on the desert plain under the guidance of wise heads, and with no other medium of exchange than its own money, dollars issued by the local government.

The notes mentioned in the official report were issued at the close of the Civil War, but the practice began even before that time.

From the office of the official historian of the Mormon church a brief outline of the facts has been obtained. It tells, without boasting, of what was incidental and not then thought to be of moment—an act which, as a financial accomplishment, is worth historical preservation.

At the time of the issue of the currency, upon advice of Mayor A. O. Smoot, father of Senator Reed Smoot, it was not only the custom for the city to furnish a circulating medium, governed as to amount by the city's ability to redeem from known resources of taxes, license revenues, and so on, and thus facilitate trade; but local banks also, commercial associations and other institutions having substantial resources or credit put out script, in denominations corresponding to the Federal currency, redeemable in such currency or specifically in articles of substantial value.

The banking house of Halliday & Halsey lithographed bills, payable in New York exchange and receivable for deposit.

The Deseret Currency Association, of which Brigham Young was president and H. B. Clawson secretary, issued in 1857, steel-engraved bills payable in the following terms:

> "Deseret Currency Association will pay the bearer three dollars in Live Stock on presentation of One Hundred Dollars. Great Salt Lake City, Utah Territory."

These bills were issued also in denominations of one, two and five dollars, and on the reverse carried the words: "GOOD ONLY IN THIS TERRITORY."

Impossible! Say Bankers

THESE bills called for redemption in the most valuable article that could be secured, we are told, despite the fact that rich gold deposits were hidden in the mountains surrounding the valley, and with the fractional currency put out, proved a great convenience, in the absence of any other money.

The Mormon Church Tithing Office dealt in all produce turned in on tithes by the people, who paid in kind from their crops, live stock, and so on. Orders payable at the Tithing Office in meats, provisions, lumber, cattle, horses, and so on, were issued in fractional denominations of dollars and cents. These orders served as a general currency in exchange for goods and were accepted by merchants, both Mormon and non-Mormon, who found it useful in the expansion of trade, and as accommodation to customers.

In all of these script issues there was at no time any purpose to supplant the authorized money of the government Ir fact, none save the "City Currency" of the post-war period could have supplanted a national issue, because of the fact that until the National Bank Act all paper money was of state authorization.

The purpose at all times was to provide the people with a local medium of exchange that would be acceptable. The result is of greater import than imagined at the time, and *stares financial experts in the face as an example of the accomplishment of what they are sure is impossible.*

Here was a people without money and needing a medium of exchange. They simply created the exchange machinery which they lacked, and it functioned; but, important to note, not a cent of interest did it cost them for many years.

The building of the Union Pacific Railroad through Utah meant much to Salt Lake City. Although the early settlers knew of the rich mineral wealth of the section, it had not been developed, partly because facilities were lacking, but chiefly because the Mormon leaders discouraged mining, especially of gold and silver.

"We can't eat gold and silver," said Brigham Young; "neither do we desire to bring into our peaceful settlements the rough element commonly found among inhabitants of mining camps, to vitiate the morals of our youth, overwhelm us by numbers and drive us again from our hard-earned homes."

The wisdom of the founder of Salt Lake City in that prophecy was evidenced in 1869. Lead ores carrying silver had been discovered in Beaver County in 1858 and considerable quantities were produced, although the presence of silver was not known at the time. Silver-lead ores were discovered in Bingham Canyon in 1864 by a party of California Volunteers, but production was not profitable. It was not until 1868—the reader will note the year is that of the last issue of municipal currency—that gulch mining for gold was attempted in Bingham Canyon, and in 1869 came the strike that loosed the flood of "mushers" upon the territory.

Usury Takes Its Toll

THIS development was the famous Emma mine in the Little Cottonwood Canyon (Wasatch Range) and its extravagantly estimated richness caused excited activity in mining in which even Mormons engaged. The Emma was sold to Englishmen for more than it ever produced.

With the influx of miners came another flood of humanity in the persons of traders, bankers, prospectors, capitalists and other adjuncts of "civilization" which Mormondom had not seen for a score of years. Banks of the more modern type were started and the little town of 12,000 grew with a rapidity that was startling.

Eventually the financial precepts of the Mormon leaders were forgotten, and usury began to take its toll. Developed on the pay-as-you-go plan and a city of greater achievement than any in the country of its size, without paying tribute to Shylock, Salt Lake City became Shylock's victim, and today with an eight per cent bond limit, or a borrowing power of $15,000,000 in round numbers, she is paying interest on two-fifths, or $6,000,000. All of these bonds have been issued since 1900. The city has shown good sense in one respect, for many of the bonds are issued serially, permitting the immediate application of taxes for sinking fund to redemption, although new bonds seem to keep the outstanding amount from decreasing.

Salt Lake City has retained ownership and management of a number of revenue-producing utilities, and the total of its receipts and expenditure of money is large. The question of taxation was an issue in the last election, and seems to be as much discussed there as elsewhere.

The example of the founders of Salt Lake City, as narrated, is a notable example of what can be done without borrowing, and of the real merit in doing it.

Who will show our bankrupt American cities how to pay as they go?

Reminding the World How Short Its Memory Is

Concluded from page 9

trips all over the United States had convinced him was the greatest domestic problem of today in America—the problem of co-ordinating business and home lives. It was from this that the book got its title. In his foreword he observes that:

> There is a great country, largely inhabited by men, to which most women, particularly wives and mothers, are strangers. Every morning husbands and sons go down to it; there they spend their days, their energy, and, in proportion as they succeed, their love. Its name is Business: it is a despotism, demanding submission to its laws, but it is a delectable country to those in its favor, luring them on and on. There are kings there, and princes—and this is the story of one of the princes who grew up to be a king—the history of a great love of which Business was jealous.

Which, aside from being true and a very good editorial on business success besides, is excellent literary stratagem accomplishing the required introduction of the well-known feminine appeal.

But, varied as he may make the careers of his characters. Peter Clark Macfarlane would have a hard time making any of them as varied as his own has been. The reader who found a fiction character who had been a freight-handler, a preacher, an actor, a newspaper reporter, a lecturer and a novelist, would be apt to rebel. The fellow couldn't possibly be true to life! Why couldn't authors be more plausible!

Macfarlane was born in Missouri in 1871 and was sent off to an agricultural college when he was 14. He went to California a few years later and for eight years worked in the general freight department of the A. T. & S. F. Railroad, with Los Angeles as his headquarters, studying as hard during each of the years as though he were still in school. He was a big, two-fisted sort of fellow and took his religion seriously. In 1902 he dropped other things and registered at the Berkeley Bible Seminary to add religious instruction to his existing enthusiasm. In 1905 he won his diploma and for six years he was the pastor of the Disciples of Christ Church at Alameda, California. To be strictly chronological, I should have sandwiched in a year as an actor in Pacific Coast stock companies between the freight department and the seminary.

For two years he was the general secretary of the Men's Brotherhood of the Disciples of Christ Church, with headquarters in Kansas City, Missouri, during which time he traveled about 50,000 miles a year and developed a skill as a lecturer that still yields him a comfortable income. He also began writing short stories, and since 1911 he has confined himself exclusively to his literary work and lecturing. All of which would indicate that he's on familiar ground when he writes about self-made men, as he usually does. He's one of the best examples of a self-made author to be found in a month's journey.

Competition for the County Fair Midway

Rural Community Theater Threatens to Drive Out Shady "Attractions" That Have Flourished So Long Because of Lack of Suitable Entertainment

By EMERSON ROBINSON

THE "midway" of the county fair, with its freaks and its fakes, its suggestive shows and raucous ballyhoo, is facing a new competition which promises within a few years to do more than all the preachments of reformers in the last quarter of a century to clean up these county events.

Planned originally as a place for the display of agricultural products, the county fairs in course of time degenerated into big carnivals with the unusual hangers-on looking for "easy marks" among the "rubes." They found plenty of them. The old-time shell game, after proving a bonanza and adding thousands to the sucker list, became so raw that officials were forced to put a stop to it—openly. It is still operated occasionally, however, and the trite saying of the master Barnum is proving true today. "For Men Only" shows are still a feature of the midway, but they, too, have been tamed and the sign is largely for advertising purposes. The violent dances of the painted sirens fail to attract; a man usually is ashamed to be seen in the vicinity of the tent. If he isn't he should be.

A more subtle title now is used, but the show must pass the censorship of a public official before it is allowed to continue on the grounds.

On the first day of the fair, the sheriff, or one of his deputies, makes the rounds of the midway. If any of the entertainments are morally objectionable, the owners either have to tone it down or close. It is seldom that a fair comes that one or two tents are not folded after the first day.

With the more brazen games of chance closed, modern methods of extracting the dime and the quarter and the dollar from the pockets of the crowd are used, the gambler's luck depending on the turn of a wheel. He may get a "dollar for a dime" or a "fine old clock" for a quarter. Or he may get nothing. He usually does, but he'll hang on and hang on and separate himself from coin after coin in the hope of winning.

The fair is an institution. Enormous crowds attend from force of habit or "just because they have no place else to go." In some of the smaller cities and villages, schools are closed. It is the annual county get-together, a great party where friend meets friend and neighbor meets neighbor without the formality of an invitation. Uncounted thousands attend solely because it is the fair. Many enjoy the races; others the display of automobiles; still others the array of corn, apples, wheat, home baking, hemstitching. And yet others find entertainment in the side shows. They are duped themselves by the enticing words of the announcer and they like to see others follow in their train. It's a characteristic of human nature.

Volumes have been written in criticism of the county fair, its evils and the accompanying loss of confidence in it by the class of people whose interests it was intended to promote. Little of this criticism has been constructive.

Is the county fair meeting the tremendous opportunity presented by the annual gathering for four or five days of the residents of the county? This is the question before those who have the real interest of the fair at heart. The answer, of course, must be in the negative. Some of the great state fairs are attempting and succeeding in putting across an educational program for the especial benefit of the farmer, but this has not to any great extent reached the counties. In some the carnival features are barred, for it is realized that this has been one of the chief reasons for the decadence of the exhibition.

It remained for a wee Red Cross rural secretary to point the way, unconsciously, too. toward a solution of the entertainment problem.

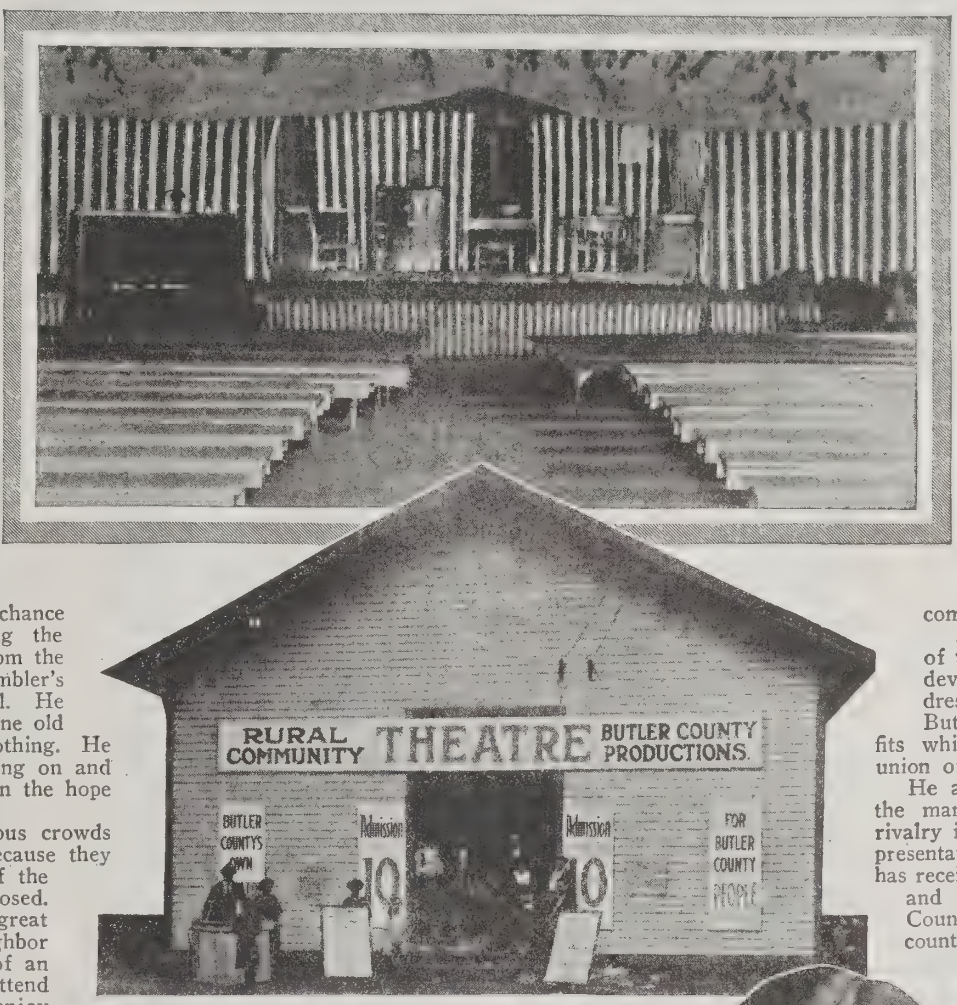
In the summer of 1921, Miss Freda Spring, now Mrs. Jack Steir, conceived the idea of a rural community theater for the especial purpose of presenting plays at the Butler County, Ohio, fair. It was an extension of the plan of Professor Albert G. Arvold in that she proposed to have strictly rural talent of one community vie with similar talent of another community for prizes of a substantial nature.

She had been teaching and preaching the gospel of outdoor play and the development of mind and muscle among the villagers; now she desired to create an interest in theatricals and to develop latent ability which she knew existed. Her greater object, however, was to incite a friendly rivalry among the communities and to strengthen the bond between the city and the country, and, at the same time, make the farming families more contented on the farm.

She may have read in H. G. Wells' Outline of History that the Olympian games, more than any other one factor, helped to weld the people of ancient Greece into a nation of conquerors for hundreds of years. Or it may have been just one of those ideas which float into the minds of those intent on doing something to benefit their fellow man.

Certain it is that she had no idea of reforming the midway of the county fair: just as certain as the rural community theater is causing such a reformation.

Those to whom Miss Spring presented her plan found her enthusiasm contagious and in a few weeks the organization was formed with Joseph Fichter, then principal of the Hanover centralized school, but now an instructor of public speaking and dramatics at Hamilton high school, as chairman, and its success in Butler County is largely due to his activities.



Above and below—Interior and exterior views of the first rural community theater in America on the Butler County, Ohio, fairgrounds.

Grange and other organizations among the farmers were urged to present plays, while merchants of the city were appealed to for funds to finance the proposition. They not only make up any deficit but provide the "props" for the various plays.

A large tent was obtained, seats placed, stage erected and, with much misgiving, Miss Spring and those associated with her attended the first show of the repertoire at the fair in October of 1921. It was a success. In three days five shows, each presented by a different rural organization, were enjoyed by more than 3,500 persons. The S. R. O. sign was hung out at every performance. The new thespians, many of whom had never trod the boards before, acquitted themselves with credit, won a new distinction in their immediate neighborhood and a little renown outside. Judges had a difficult time deciding which of the troupes should have first money.

"Just wait until next year," was the smiling retort of those who failed to share as winners.

Men in control of the fair were quick to realize the benefits to be derived from such a theater. So for 1922 they provided a hall with good seating arrangements and an acceptable stage. Merchants were more enthusiastic than ever and they were among the first to insist that it be made a permanent feature of the county's big annual event. More than 5,000 persons crowded into the hall last year.

So far as Butler County is concerned, the rural community theater, the first in the nation, is a success. It has resulted in a closer unity between the city and the country and created keen but kindly rivalry among the rural communities. It has developed hidden powers among a large number of rural folk.

It is not a money-making scheme, because only a nominal admission is charged. By encouraging one-act plays, thus permitting more persons to see them, it is hoped to make it entirely self-supporting.

One of the direct results of the rural theater has been the organization within the past two months of the Community Drama League. The idea is to further develop local talent and to present plays of legitimate length as distinguished from the one-act plays featured at the fair. Both rural and city folk are members of the league. More than 2,000 persons enjoyed the first offering, a comedy, given recently. Compared to many professional plays for which high prices are charged, the Drama League players will carry off the prize. Some of those who took part got their first experience in the rural theater and this, of course, fitted them for the broader field of amateur theatricals sponsored by the league.

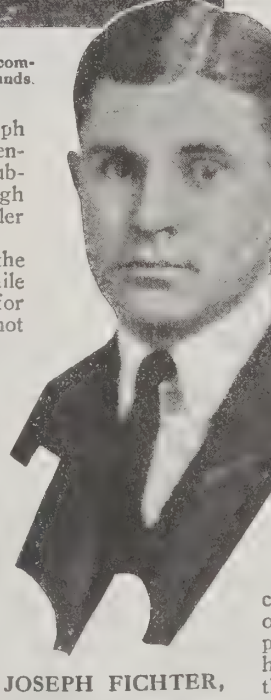
So interested were many of the rural sections in the production that it had to be repeated and in one village and environs alone, more than 100 tickets were sold.

The play netted several hundred dollars' profit and the money was invested in books on drama and music. These were placed in the public library.

It is not the plan of the league to make money. Only nominal prices are charged and if there is any profit in future shows, it will be invested for the benefit of the community.

A speaker before the annual convention of the Ohio State Grange a few weeks ago devoted no inconsiderable part of his address to the theater as developed for the Butler County Fair. He told of the benefits which have been derived from a closer union of the city folk and the farmers.

He also described at length the benefits to the many farm communities because of the rivalry in producing plays for the great annual presentation. Since that address Mr. Fichter has received a flood of requests for one-act plays and for detailed description of the Butler County Plan. Delegates from nearly every county in the state were present at this convention and if the interest shown by them is any indication of future action, Ohio farm communities may feel assured that the play spirit will be developed to the utmost within the next few years.



JOSEPH FICHTER,

To whose energy and enthusiasm the theater owes much of its success.

In Butler County it is the hope of those sponsoring the movement to have a theater for the annual contests at the fair. It is their hope not only to make the building useful during the one week of the exhibition but to throw it open the year round for conventions of farmers, stock raisers and other organizations interested in agricultural advance.

As the fairs are conducted today, the hundreds of acres needed for the annual show are in use only a small part of the time. The grounds are rented for picnics and celebrations but the total of these will not exceed a month, and the investment, reaching in each county to a hundred thousand dollars or more, is idle most of the time. In a few communities an attempt has been made to open the grounds the year round for park purposes but this idea has not made much headway among the fair directors who fear that by doing so, the property will be damaged.

The rural community theater may help to solve the problem of the continuous use of the fairgrounds, so that they may become the great central play place, especially in those districts which lack advantages of parks.

But whether it does solve this problem or not, it is a safe prediction that the rural theater idea for the fair will spread and will become a standing feature for the great annual community parties, and that it will aid in restoring public confidence in the exhibition.

Also it is a safe prediction that the present discredited midway is due for a long vacation.

Those who visit fairs are interested in what their own home folks do; they're tired of being hoodwinked by a lot of cheap "attractions."

And what is better than for a community to support its own people? It strengthens the town and when you strengthen the individual units you strengthen the nation.

Rent Strikes in Scotland: a Dormant Volcano

Faulty Legislation Brings Domestic Troubles Sharply Before Government

By W. P. CROZIER

GLASGOW "made political history" at the last general election in England by returning to Parliament a phalanx of dour and bitter Socialists. It is now likely to make still more history—the Socialist M. P.'s themselves threaten it—for it has raised a big issue between landlord and tenant, the government is in a cleft stick and the Socialist leaders mean to exploit an economic question to the utmost political advantage.

The whole eruption, which may before it finishes be volcanic in its energy, springs from the question of house rents. When at the end of the war it was discovered that everywhere throughout the country there was a great shortage of houses and no building in progress, the government had to intervene to prevent landlords raising the rents to an inordinate height. This was done so effectually that the landlord has for years been one of the most unlucky of investors; he was not able to abstain from doing a certain amount of repairs, while at the same time he was not permitted to increase his rents to anything like the real market value.

Some increase, however, he was at last permitted to impose and the extent and character of the increase were very carefully regulated by the Rent Restrictions Act of 1920. This is the act whence all the hubbub springs. The first thing to remember is that in English law a landlord cannot simply impose an increase of rent on a tenant at his will and pleasure. An increase of rent means legally a new contract. It therefore means, legally, the termination of the contract already existing. In other words, the landlord must terminate one contract before, or at the same time, he invites his tenant to accept the new one which includes the increased rent. Here is a definition of the principle not by a layman but by a legal writer:

Illegal, Trouble Follows

"A LANDLORD cannot—he never could—increase the rent for any reason whatever during the continuance of a lease or tenancy . . . . The first thing a landlord has to do is to give proper notice to quit before or at the same time as he gives notice to increase the rent in the form given in the act."

This was written at the time of the Restrictions Act of 1920. Nevertheless in Glasgow and the West of Scotland the landlords and house agents (factors they are called) did not in fact serve this notice to quit. They increased the rents. They received the increases in actual cash. But these increases were illegal because the notice to terminate tenancy had not been served. It is estimated that in Glasgow alone nearly 200,000 tenants began to pay increases in rent which technically the landlords had no right to exact. How did this extraordinary oversight, or negligence, on the part of the landlords arise? Some say that it was due to the ambiguity and vagueness of the act of Parliament. Acts of Parliament have a bad reputation for obscurity and bad draftsmanship, and few people study them carefully. The vital clause in the act runs as follows:

"Nothing in this act shall be taken to authorize any increase of rent except in respect of a period during which, but for this act, the landlord would be entitled to obtain possession."

That certainly means that the landlord would only be entitled to obtain an increase of rent as soon as he was in a legal position to enforce a new contract, that is, as soon as he had served notice to quit. Why, then, was this stipulation ignored? Landlords and their agents at least should know the law. Almost all over England, in millions of instances, landlords served the legal notice to quit. (Exceptions are reported from London and Manchester but, so far, not many.) Perhaps the Glasgow factors thought that in a general national movement of this kind to raise rents they need not bother about technicalities. At all events they did not. The Glasgow Socialists, on the other hand, declare that it was pure niggardliness that animated the factors—they would not go to the expense of several hundred thousand registered letters carrying the notice to quit. If so, in saving pence they went the right way to lose pounds, for there were other Scotsmen as keen and thrifty as themselves, and in a very few months some of these "tumbled to it" that the increases had been illegally enforced.

Then, indeed, the fat was in the fire. Many Scotsmen are generous but there is no stronger characteristic in the race than the determination not to be "done," not to pay a penny more under compulsion than is rightly due. A Scottish case was recently heard in the law courts which involved the sum of 4½d. (four pence half-penny). The question was whether this sum could or could not be legally demanded from a Scottish workingman, and he and his organization fought the case through every court up to the supreme court of all, which is the legal side of the House of Lords. Scotsmen were proud of that workingman. So, if the factors thought to save money in 1920, they forgot that they were dealing with their own fellow countrymen. As a matter of fact, it was a Jew who pointed out the way. Emanuel Shirwell, a sharp-witted Glasgow Jew who is now one of the Socialist M. P.'s for the city, was the first to test the matter (in 1920) in the courts. He, indeed, had no success but in 1921 another Clyde tenant refused to pay his rent, maintaining that the demand had been illegal since the act of 1920. The landlord sued for the money in the sheriff's court at Dumbarton. This is the case, which may become one of the most famous in our political history, of Kerr *versus* Bryde. The Dumbarton sheriff found that the tenant was right and the landlord wrong. The landlord appealed and the court of session upheld the tenant. The landlord appealed to the House of Lords and the highest tribunal of all again upheld the tenant. This was enough. The great rent strike at once began.

The tenants say that the increases of rent which they have been illegally compelled to pay amount to from nine to twelve months' rent. Tens of thousands of them are now steadily refusing to pay any rent at all until they have worked off the excess which they have paid, and a great many unfortunate landlords are no longer receiving the rents on which some of them entirely depend for their livelihood. Those tenants who are not actually refusing to pay rent are sternly demanding the return of all the increases which they have paid since 1920. What does the government propose to do about it? This was already a burning question at the election a few months ago. The Socialists appealed for support as the party which would secure the return of these illegal increases and protect the tenant who now refused to pay his rent. One woman voter, on entering the polling booth on election day, is recorded to have said, "Is this the place where I can get my rent back?"

The government is between two fires. The tenants demand that increases paid between 1920 and now should be returned, as in strict legality they ought to be, and that the landlords should be forbidden to recover in the courts the rents that are now being refused by the tenants. The landlords, on the other hand—and they are powerful with this government—demand that there should be "retrospective" legislation, making the increase legal right back to 1920, and giving the legal right both to keep the moneys that have been paid and to recover the rents that are now being denied. Mr. Ramsay Macdonald, the Labor leader and head of the Opposition in the House of Commons, declares solemnly that if the government should do what the landlords ask, they will be "deliberately heading for a revolution." That is a fairly grave threat. Yet, be it noted, no one denies that in 1920 Parliament definitely intended to grant to the landlords the power to increase rents. The landlords only failed to fulfill the legal formalities necessary to carry Parliament's intention into effect.

Moral Side of the Question

THERE is clearly here a legal and a moral question, and people are hotly divided according as they lay stress on the importance of legality or the overriding title of moral obligation. Those who insist on legality say that what matters is not what Parliament is supposed to have intended but what Parliament enacted; that it is ill work to make legislation retrospective because one section of the community has chosen to be careless or negligent; and that it would be worse work still to intervene on the side of the careless and negligent when they happen to belong to the more comfortable "classes" of society.

It is fair to say that not only the Labor men and Socialists take this view. There are others who maintain that, apart from political expediency, it would be wrong to secure to the landlords these increases of rent when they had not fulfilled their own legal obligations. One of the most respected of our county court judges, E. A. Parry, puts the difficulty in this way: "Parliament having solemnly decreed that certain payments of rent are illegal, would stultify itself by turning round and saying afresh that it did not mean what it said, and, once make such a precedent, each new Parliament would compete with its predecessor in similar retrospective legislation."

On the other hand, the moral argument is very strong and the airy way in which the Scottish Socialists (and Mr. Ramsay Macdonald) waive it aside leaves an unpleasant impression. Before the war, let us say, I paid £40 rent a year. In 1920 my landlord is given power to add on 10 per cent. So are all landlords. I pay the increase. In my mind I assented, as we all at that time assented, to its justice. A year later I discover that as he did not serve on me a formal notice to quit—which would have been a pure formality in the sense that there was never any intention, or means, of enforcing it—I was not legally bound to pay the increase and that I can recover it. I therefore refuse to pay my rent or I sue the landlord in the courts for the return of the money paid. Surely it is not only an indecent but an immoral thing to do. A great many people who are not landlords or Conservatives certainly think so. But this is the view which Mr. Ramsay Macdonald, the Socialist leader, has expressed:

Mr. Macdonald's Views

"I AM a worshiper of moral right; there is not nearly enough moral right embodied in law. But observe the worship done by these new yearners after moral right in statutes. They begin by discarding the moral right of tenants enshrined in the 'notice to quit' provision; they discover the majesty of moral right only as an escape from the penalty of legal delinquency; their devotion to it comes on a case when law empties the pockets of interests kindred to their own and this 'moral right' fills them. I am suspicious of this."

This is poor argument. One might as cheaply say that Mr. Macdonald's fervor for "moral right" cools very rapidly when it touches the pockets of the men and women among whom he looks for political support. But the position of the government is difficult. If it enforces the rights of the landlords since 1920 to the increases which the act admittedly intended them to have, there will be a tremendous political storm, though not perhaps Mr. Macdonald's threatened "revolution." If it does nothing, then it is hard to say how far this infectious habit of refusing rent may not spread. Even if it passes retrospective legislation it is hard to see what the Glasgow landlords can do to recover the arrears of rent. Evict the tenants? But already in Glasgow there is a shortage of 20,000 houses; and there are nearly 60,000 people living in 13,000 houses which have been condemned as unsuitable for human habitation; there are 1,000 "tenements" in each of whose rooms or pair of rooms live not less than three families. Wholesale evictions in Glasgow! That is unthinkable or, if thinkable, it would bring Mr. Macdonald's gloomy vision unpleasantly nearer.

Perhaps, at the finish, the government will seek to avoid the worst by compromising. It may tell the landlord that he must sacrifice his increase of rent from 1920 to some given date in 1921 or 1922 and to the tenant that from that date he must pay up. In that way, seeking to please all sides, it will please none. In this quarrel one thing only is certain, that whatever the course the government follows, it stands to lose politically and the Socialists to gain.

"Of Usurie"

Concluded from page 8

Apostles, was the old way and no doubt the good way. We think our selves wiser than they; but I am sure they had more religion than we. Of this new learning for the defence of usurie, I confess they were altogether ignorant. Though they were fathers, yet concerning naughtinesse they were children, as the Apostle wished them to be. 1 Cor. 14:20. The ancient Fathers . . . . never mentioning usurie, but condemning of it with so many invectives as would fill a whole volume of themselves. We find not any of them writeth of it, but writeth against it, without any mincing or qualifying of the matter. Saith Basil, "Sell anything but thine libertie. Worthily is usurie termed TOKOS, for it breedeth and bringeth so many mischiefs one on the necke of another; an unnatural brood, like the generation of vipers, which eateth through the entrails of the mother. An unnatural and monstrous brood." See what S. Chrysostom thought. They were very charitable Usurers in his time; for their ordinarie excuse was, *I have taken usurie, but I have given to the poore*. But God, saith Chrysostome, is not delighted with such sacrifices; thou hadst better not give at all than give such alms. Doe not you your selfe count usurie sordide? Do not the lawes forbid Senators and publick persons to defile themselves with such filthie lucre? The author of the unfinished worke upon Matthew, though it be not Chrysostom, yet agreeth in this; that while usurie seemeth to gaine, it taketh; while it seemeth to succor, it oppresseth; while it delivereth from one bond, it inwrappeth in many. It luls men to sleep like the poison of asps, and as leven it converteth the whole substance of a man into its owne nature, that is, into debt. S. Ambrose saith, There is nothing more horrible than an Usurer. Tertullian doth touch usurie but to reject it. Lactantius saith, It corrupteth the benefit of a loane. If wee desire S. Augustine his judgment for this point, hee is so confident that he appealeth to the Usurers themselves, who practised in his daies: "How detestable a thing it is to give money upon usurie, how odious, how execrable, I suppose the Usurers themselves are not ignorant . . . . If thou looke to receive anything more than thou gavest, thou art an Usurer, and therein to be condemned." His finall sentence is, "That Usurers belong not to the Church of God." So far were these holy and learned Fathers from moderation or qualifying this practice of usurie, that whensoever any of them doe meete with it, they sharpen their pens as if their spirits were moved and stirred in them more than ordinarie. Verely they discerned some malignant and venomfull qualitie in usurie which opposed itselfe to that spirit by which they wrote. Usurie ever been held even among the heathen for a grosse enormitie. Plato in his Lawes, and his scholar Aristotle in his Politicks have forbidden it as unlawfull, and condemned it as unnaturall. Cato maketh it twice as bad as theft, and doth equal it with murder. Seneca findeth a place for it in the calender, but not in nature. Pliny saith, *it maketh idleness itselfe* fruitfull. Plutarch writeth that the usurers doe mocke the Philosophera for that old principle, *ex nihilo nihil fit;* because they can make something of nothing, yet for all that he takes them not as gods almightie, but termes them plaine divils.

Human societie cannot stand without lending and borrowing, as S. Basil notes. Wherefore God hath made men sociable creatures. He that would borrow for a needlesse desire is unlawfull: And hee who hath need to borrow, would not willingly borrow but for need; much lesse would hee pay Usurie, if with convenience he might borrow freely. We must not doe evil either that good may come of it, or that evil may be prevented by it . . . . Little are the things that undo us . . . . A reasonable, moderate, conscionable usurie, like an honest kind robber, who alloweth a man part of his own money back againe to beare his charges . . . . wrecketh (man and nations and conscience) upon the sand.

International Science Briefs

By **DR. ARVID REUTERDAHL**

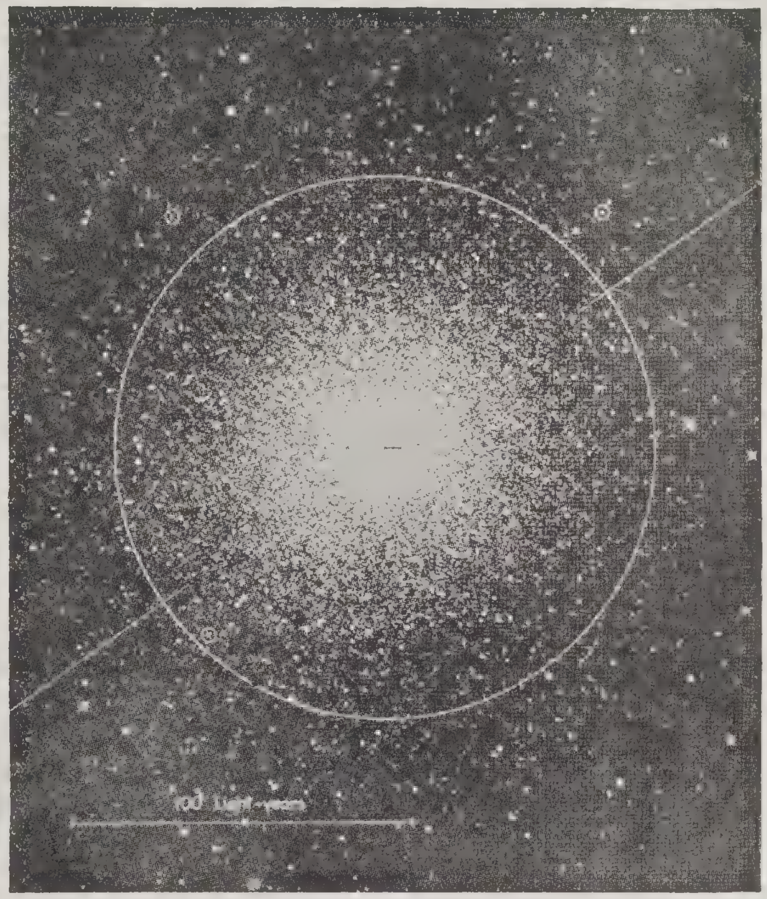
President, Ramsey Institute of Technology, St. Paul, Minnesota.

The New Scientific Outlook

THIS is the era of upheaval. Turmoil, strife, eruptions and discord seem to be the order of the day in the world of intellect and in the world of politics. It is a curious fact that both of these turbulent waves parallel each other. May it not be that all this is an inevitable antecedent to what Dr. Robert T. Browne has termed the "Newer Day"? Chaos will give way to cosmos and, as Dr. Browne maintains, "the newer forces must win." A new spiritual and intellectual world is being born. In the melting pot of human problems and aspirations, opinions and attitudes are being fused into a harmonious whole which will finally result in a great good.

In the world of science a great battle is being waged. The cosmos is being rebuilt. Old theories are being shattered. Every time-honored hypothesis is probed and the most cherished conclusions are questioned. Fantastic and cyclonic waves are sweeping over the ocean of intellect and the ship of science has lost its rudder. Four-dimensional spaces are being dragged out of the magician's cabinet and made to perform astounding and weird feats. Instead of artistic cubists we have scientific "fourthists" who make worlds turn inside out when they crack the mathematical whip. The visionary *fourthists* have actually deluded themselves into believing that they can really create worlds from a nebulous spray of mathematical equations and their hectic nerves are soothed by what Dr. Sydney T. Skidmore has appropriately named "mathematical jazz."

Dr. Charles P. Steinmetz boldly proclaims that there is no ether but forgets that every physical manifestation involves some type of material change or disturbance. This view of Steinmetz has been given wide publicity in the subsidized scientific and popular journals which form another phase of the scientific chaos of our times. Many years before Steinmetz dared to think such heretical thoughts, the writer denounced the ether hypothesis as a self-destructive speculative inconsistency. That was in the year 1902. One does not expect the subsidized journals of today to take cognizance of dates, particularly if the person whose priority is involved happens to have taken issue with Einstein, the first, and it is to be hoped, the last scientific demagogue of all times. Dr. P. Lenard, of Heidelberg, Drs. H. Fricke and E. Gehrcke, of Berlin, Dr. Don Jose Comas Sola, of Spain, Dr. Stjepan Mohorovicic, of Jugo-Slavia, Dr. O. E. Westing, of Sweden, Dr. T. J. J. See of the Mare Island Observatory, and the writer have warned the scientific world concerning the extremist position represented by Steinmetz and fathered by Einstein. If we do away with the ether because of its inconsistencies, we must not delude ourselves with an equally inconsistent and impossible notion that such actual physical manifestations as light, electromagnetic phenomena and the transmission of radio waves and vibrations are possible without a genuine physical medium. The great universal law of the cosmos applicable to all finite existence is that *all observable manifestations are due to some type of material disturbance*. This is the position held by the writer in 1902 and further developed in his work, "Scientific Theism Versus Materialism, The Space-Time Potential," published in 1920. The writer holds that all physical phenomena are due to specific primal cosmic activities manifesting as observable matter. In inter-stellar space primordial matter exists in a *neutral* condition. Neutral matter when disturbed by *excitant* matter of the *electronic* type is responsible for such phenomena as light, electromagnetic waves and radio transmission.



Star Cluster Hercules, showing stars that are 1,000 times the size of our sun.

Dr. H. Fricke, the eminent physicist, of Berlin, is devoting much time and careful thought to the phenomenon of gravitation. He has departed from the old idea of a central force made famous by Newton. The writer abandoned the notion of a central force many years ago. The new movement in science is peculiarly related to the great Newton in that it shows a tendency to rehabilitate the old corpuscular theory of this scientist in a modernized form, whereas it is departing from the Newtonian conception of a central force. In the case of our planetary system Newton regarded the gravitational attraction of the Sun as the central force which held the planets in their orbital paths. In the New Science the orbit of a celestial body is a result of the interdependent interaction of all the material groups and is not regarded as an isolated phenomenon in the Newtonian sense of a single independent central force. In fact an independent force no longer has any genuine physical status except as an arbitrary convenience in limiting an investigation. This view is in complete accord with that set forth in the writer's work referred to above. At the present time the world is considered as one physical unit, a single colossal compensating machine, in which a change or disturbance at one point necessitates automatic compensating changes at some other points. Independent and isolated forces traveling from one point to another in the physical universe, in the light of this new view of cosmic action, become purely fictitious and meaningless. Physical action is *interaction* between dependent and related material particles which are parts of one harmonious, compensating cosmos.

Einstein's Theory of Relativity is a mathematical attempt to unify the material portions of the universe into a single system operating under a definite law of motion. Einstein failed in his attempt because he was led astray by the "mathematical space-time jazz" of Minkowski and for the further reason that he assumed that the contraction theory of Lorentz represented actual physical facts. The theory of Lorentz, that a moving body will become shorter or contract along lines parallel to the direction of motion, is nothing other than undemonstrable mathematical fiction without a vestige of supporting evidence in the physical world. The writer's attempt at this unification antedates Einstein's and is grounded primarily upon demonstrable physical facts.

Dr. T. J. J. See, in his masterly work, "A New Theory of the Aether," has departed completely from the old ether hypothesis of Maxwell, Kelvin and others. He has fully realized the inconsistencies of the old theory and has substituted for "the all-pervading continuous medium" a material ether composed of discrete particles. This is in harmony with the writer's conclusions concerning the nature of the new medium now required by science. Dr. See proceeds in his work to develop a new theory of gravitation and magnetism not based upon the Newtonian central force hypothesis. Here again we find the new tendency of modern science to depart from the untenable position of Newton concerning central forces.

Another interesting development of modern science deals with the size of the physical universe. This field of speculation was first made popular by the visionary conclusions of Einstein. The commonly held view concerning the world is that it extends indefinitely in all directions. Every rational person can think of space as extending continuously outward in all directions without end. Einstein's friend Minkowski was destined to play havoc with common-sense notions and to turn the world topsy-turvey. Minkowski, it is claimed, harnessed the horse of time to the cart of space. Later the animal became so frisky that its original driver lost the mastery and was thrown out of the cart. In this dire emergency the fearless Einstein leaped into the vehicle and seized the reins to save the wagon of Relativity for an unsuspecting, and gullible world. This heroic deed won the applause of many somnolent scientists. Subsequently our hero discovered, in the wagon, a new and curious instrument overlooked by Minkowski. When Einstein looked through the lens of this instrument he found that all straight lines are really not straight but curved, and from that time on all straight world lines curved back upon themselves until both ends met. This was the end of an unending world and Einstein at once furiously attacked the problem of determining the radius of his finite universe. Neither the result nor the method of calculation interests us since our only intellectual reaction is one of sympathy for common sense gone astray. The normal mind will forever refuse to part with its notion of a straight line, and space extending outward without end in all directions.

The interesting contribution of Dr. Harlow Shapley concerning a tentative center of the universe has nothing in common with the fantastic speculations of Einstein. The splendid work of Shapley has given us a new and startling conception of the magnitude of the physical universe. Some of the most notable observations of Dr. Shapley deal with the Hercules Star Cluster. This group of stars is so far distant that it requires 36,000 years for the light from the cluster to reach the earth. We are indebted to Mr. William A. McGarry for the photographic image, reproduced herewith, and for the following summary of the work of Dr. Shapley:

"A photographic image of the Hercules Star Cluster has been taken by Dr. Shapley. Reproduced, it looks merely like innumerable splotches of white on a black background, or black on a white background. But on the original plate the scientist has counted more than 30,000 stars, each many times larger than the sun. On the reproduction he has marked with rings three stars, each of which is photographically almost exactly 100 times as bright as the sun, and he is authority for the statement that the most luminous giants in the group exceed a thousand suns in light emission. Dr. Shapley estimates that the now known stellar universe is about 100,000 times larger than had been suspected previously."

In conclusion we shall touch briefly upon the relation of religion to the new scientific outlook. Dr. Charles P. Steinmetz recently stated that, "There can be no scientific foundation of religion, but belief must always remain the foundation of religion, while that of science is logical reasoning from facts, that is, sense perceptions." Dr. Steinmetz overlooks the fact that logical reasoning as well as the gathering of physical data are both based upon the greatest of all world postulates, that the world is rational. Thus science itself is grounded ultimately upon faith. For this reason the truths of religion are equally demonstrable with the truths of science. The writer has shown in his "Scientific Theism Versus Materialism" that the truths of religion logically follow from the facts of science.

LIBRARY OF THE UNIVERSITY OF ILLINOIS

BRIEFLY TOLD

German shipyards have more than returned to their pre-war state. The largest vessel launched in the world last year took the water at the free port of Danzig. A 20,000-ton steamer was built at Hamburg.

The onrush of water from a torrential downpour awakened a Negro farm hand near Durant, Mississippi. Leaping from his bed he found a section of the Illinois Central track washed out. He procured a lantern and speeding down the track he flagged the New Orleans-Memphis-Chicago fast passenger train, probably saving the lives of many passengers, as the train was rushing through the night at the rate of 50 miles an hour. Efforts are being made to obtain a Carnegie hero medal for the Negro.

An artist of New York uses only the many-colored petals of flowers instead of oil paints and thereby achieves most satisfactory and extraordinary results.

Peter B. Kyne, famous short-story writer, told a Los Angeles business organization that he could "see no future for the motion picture industry until it gets down to brass tacks and establishes a code of ethics. The drama of today, as represented in the motion pictures, is for the most part mere hokum. Those who control the pictures do not want good, clean, wholesome stories. The people are tired of hokum. What they want is pictures which appeal to the heart with here and there a vagrant tear and a laugh. The pictures now being shown are built on the theory of shocking the nervous system, rather than by appeal to the heart."

The average length of life in the United States is 56 years. This is 15 years more than it was in 1870.

A 15-year-old boy of London, England, went into a cage of lions to earn money to pay for an operation on his younger sister who was lame. He won the prize of $250 but the surgeon would not take it so the boy turned the cash over to his little sister.

Article 24, section 2, of the Dutch labor law says that "a workman in a factory or shop shall not do any work between 6 p. m. and 7 a. m."

The password of the Tower of London is known to only three persons. They are the king, the lord mayor and the constable. His majesty sends the password to the lord mayor quarterly. This is merely a survival of one of the numerous old customs in London.

One of the strangest considerations ever written in a deed is contained in a document recently recorded in Laporte, Indiana, by Stella Cizewski and Adam Jankowski. For a consideration of $1 and "a promise of marriage" Mrs. Cizewski has transferred a town lot to her fiance.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

An invention by means of which rubber is impregnated with nitrogen gas, thereby filling it with innumerable cells, may revolutionize the making of rubber. Onazote is the name of the new product. A ball of it was subjected to a pressure of 32,000 pounds. In 24 hours it reasserted itself sufficiently to hit the ceiling when bounced from the ground. It is more buoyant than cork in water.

Speeders in Akron, Ohio, are fined $1 for each mile beyond the 20-mile speed limit, their machines being timed by arresting officers. When arrested within a school district the speeder's fine is doubled.

The Long Island Railroad has adopted a policy which will appeal to travelers. When for any reason a block occurs, the reason will be explained to passengers by announcements in each car. The common practice of all employes on all roads is to simulate ignorance. This attitude is encouraged by the railroad officials. Now whether the trouble is due to hot box, broken brake beam, defective signals or what not, the delay will be explained in the belief that the public will readily excuse the delay when it knows the cause.

The number of forest rangers engaged in forest control, to prevent fires in Quebec and Ontario, will be tripled during the coming season.

The farm of Ellisland, near Dumfries, where Burns wrote "Scots Wha Hae" and "Tam o' Shanter," and many other poems, has been given to the Scottish nation by the terms of the will of the recent owner, a gentleman of Edinburgh. The buildings as far as possible are to remain as they were in the time when they were occupied by Robert Burns.

On the famous Liberty Bell, in Independence Hall, Philadelphia, is the inscription: "Proclaim liberty throughout all the land unto all the inhabitants thereof." This is taken from Leviticus 25:10.

It is now possible to ship milk several hundred miles without having it spoil. The old-fashioned milk can has given way to huge glass-lined tanks similar to the familiar vacuum bottle. These tanks are mounted on trucks and are insulated from the heat by the use of cork packing. Less than two gallons of milk stick to the sides of these 5,000-gallon tanks. Milk has been handled in these tanks over distances of more than 100 miles with a rise of less than two degrees in temperature on hot summer nights when the outside atmospheric temperature stood at 88 degrees.

Luther Burbank has accepted a place on the board of directors of the national campaign for boll weevil control. He is one of several leaders in financial, agricultural and scientific circles to take an active part in this crusade against the pest that is destroying millions of dollars' worth of cotton each year.

Human slaves are sold on the block in Abyssinia, according to information reaching the League of Nations. Humans are caught in the open, chained, grouped and sold into slavery for rich slave holders living in the interior of Asia Minor. The latest 1923 quotations are as follows: Able-bodied male slaves, $6 to $24, according to age, strength and productive ability. Female slaves, demand slight, $6 down. Child slaves, absolute drug on the market.

Married men employed by the city of New Orleans hereafter will have their pay checks mailed to their home address. Every man from the mayor down to the street cleaner is affected.

A Japanese has invented an ingenious wind turbine capable of utilizing air currents in the generation of power. When the velocity of the wind is eight meters a second, the model develops four horse power. Its equipment includes a storage battery by which the power generated may be held in reserve to secure service when the wind subsides.

Blind persons who reside in Ontario may travel free of charge on the street cars of Toronto and environs. Applicants for passes on this account must be totally blind.

PROPAGANDA OR FACTS?

The world today is flooded with propaganda. There is a scarcity of facts. Pick up a magazine or newspaper and glance through it. Aside from local news—how much dependable information do you find?
That is why Henry Ford established

The Dearborn Independent—The Ford International Weekly

A non-partisan, non-sectarian weekly magazine, devoted to printing facts—a chronicler of the neglected truth.

Any Ford Dealer will gladly accept subscriptions or they may be sent direct, using the blank below.

I've Decided to Quit Advocating Justice

Justice Is a Sacred Word, He Admits, Like Witchcraft, But the More Sacred Such a Word Is, the More Trouble It Causes, He Declares

By CHARLES W. WOOD

IF THERE ever was a word which ought to be abolished, it is the word *justice*. Until we get it out of our thinking, human progress will continue to be a slow and painful operation.

It's a sacred word, I admit. So was witchcraft. That's my big grievance against it. The more sacred such a word is, the more trouble it causes. So long as people generally had a religious conviction that witches caused boils, it not only raised havoc with "witches" but it kept us from curing boils.

What was a witch? Nobody knew. We had to have a very learned investigation in each case to find out. The common people were terribly ignorant in the matter. Had it been left to them, they might have killed some old woman for being a witch who wasn't a witch at all. Only those who had made the matter a lifelong study could ever be depended upon to say for sure. These learned ones, however, were able to isolate several hundred thousand specimens all told, which were tortured to death one by one.

What is justice? Nobody knows. Nobody has ever seen it and nobody can define it exactly. In each particular instance, we must leave the determination of the matter to specially qualified experts who have given the subject a lifelong study. With their august assistance, however, we have burned and hanged and racked and tortured and imprisoned uncounted millions of our brothers and sisters: and yet the human race hasn't become an altogether happy family.

It's Always Justice

OCCASIONALLY it is necessary to go to war and do the killing on a wholesale scale. But always in the name of *justice,* remember that. It is impossible to get people to fight any longer for any other cause. Did you ever hear of a modern nation fighting for money, for territory, for aggrandizement? If we are to take what one side says, of course, that is what the other side always fights for: but that is surely no way to discover the real motives. What was it that appealed to the average German farmer and mechanic in the late war, if it wasn't justice to Germany—his concept of what Germany, due to her superior something-or-other, was really entitled to have? Read the kaiser's speeches which so thrilled the German populace that they were willing to walk up to machine guns and die in piles. Every one of those missives was a sacred recital of German "rights."

The czar fought for justice, too. Incidentally, we know from the record, he was also anxious to make the world safe for democracy, but it cannot be denied that his main motive was justice. Russia, from his point of view, was *entitled* to Constantinople, and to everything else which Russia might conceivably get.

Along came the Bolsheviks. What was their watchword? Justice. Justice to the workingman. Let each worker receive the full product of his toil and everything would be about all right. Pretty soon there wasn't any product and that mussed up the situation a bit: but the ideal remained untarnished.

Applies Here, Too

COME now to the United States: it will be conceded, I think, that this country has always fought for justice. We have fought not only for justice to ourselves but for justice to smaller nations as well. Justice to the Mexicans—did we not arrange it so that great slices of Mexican territory could come under our flag? Justice to Cuba. Justice to the Philippines. Justice to France, Belgium, everybody. To be sure, we never intentionally fought *against our own interests*: but, unlike all other nations in world history, our nation was never led astray by momentary catchwords. Funny about us, isn't it? Funny that we happen to be the only nation which, in every national contest, has always been right?

No, it isn't funny. All nations are like that. All groups are like that. All individuals are like that. In every war that ever happened, in every lawsuit, in every strike and in every individual quarrel, both sides have always fought for their rights. All that anyone has ever asked for has been justice—a thing which nobody can define so that the other side can make head or tail out of the definition, and a thing which nobody has ever seen. It happens, also, to be a thing which nobody wants. We think we want it, just as we once thought we wanted to get rid of witches. What we really wanted was to get rid of the whole *concept of witchcraft;* but we wallowed in agony for centuries before we ever discovered that.

I say that justice cannot be defined. As in the case of witches, however, there have been many attempts at a definition. "An eye for an eye and a tooth for a tooth." This sounded once as though it meant something. A man had his eye put out and he put out the other fellow's and the books seemed to be balanced perfectly. In actual experience, however, there was something missing. It was that eye. The fact that the other fellow's eye was missing, too, didn't make that one see any better than before.

But the other fellow *deserved* to have his eye put out, didn't he?

That was always a question. Sometimes you could prove that he did and sometimes he could prove that he didn't: but whether he did or didn't made not the slightest difference. What mattered was whether you could muster up the necessary force to perform the operation. If the force was on your side, justice prevailed. If it was on his, justice was overridden. And in either case, your eye was on the blink regardless.

"Let the punishment fit the crime." That is an ancient principle of law which is still muddling our thoughts and raising general confusion. Our practice, fortunately, is better than our theory; for many courts are making desperate efforts to reclaim culprits instead of merely punishing them. Children are being treated as delinquents and adults are sometimes paroled: also we are doing something to make our prisons endurable, where once they were places of unrestricted torment. But we still hang to the *idea of punishment.* We are still obsessed with the superstition that it is possible to hand out sentences "on the merits of the case." Until our theory is corrected—until we come to do some straight thinking on the question—the reform of our practice will be painfully slow.

It Can't be Measured

I DON'T mean to say that the struggle for justice has been altogether vain. Justice was a bright idea once, considering what existed before. "An eye for an eye" was an advanced thought, compared with the prevalent practices in Moses' time. If you lost an eye in those days, it was your cue not only to gouge out the other fellow's eye but both his eyes, also the eyes of his children and his cousins and his aunts.

That is, if you could. But mostly you couldn't and even when you could, you and your relatives generally got badly bunged up in the process. Enter the Lawmaker. Wouldn't it do, says he, to pay for one of your eyes with one of his, *provided I can get guaranty payment?*

You accepted, for economic reasons. The rate of interest was lower but the investment was safer in the end. So the reign of law dawned, instead of the rule of the Big Stick. It was a great stride ahead in human affairs. Just the same, it is time to forget about it now. It was a wonderful stride ahead when oxen were first attached to carts: but attach an ox-team to a modern touring car and they'll only get in the way.

I used to work in a sulphite mill for $1.30 a day. I hated my job. I thought my wage was unjust. I longed like everything for "the full product of my toil." I spent 10 hours a day one week, and 13 hours a night the next, for $7.80 a week. I couldn't eat decent food, buy decent clothes or live in a decent house for that. Worse than that, I couldn't develop normal human longings. I couldn't even make love normally to the right kind of a girl: and had I married, I couldn't have supported a family in any kind of shape.

And I thought all along that the trouble lay in my being cheated out of the "product of my toil." Actually the company failed. Actually I, and others like me, cost that company a lot of money every day they kept us on such a job. We didn't know anything: neither did the management. We were both so interested in our "rights" that we had no intelligence left to bring to the job.

Justice, you see, is a thing that can't be measured. Even if the company had set experts on the job, they couldn't possibly have told how much any individual was "worth." A labor court is quite as ridiculous as any other kind of court. An eye cannot be measured by an eye: for while it does you a lot of harm to have one gouged, it does you no good whatever to gouge out some others. It is equally impossible to measure the deserts of labor and capital. Both may yell for their rights, and they will have their yelling for their pains. At best, as in the case of nations at war or litigants at court, what each side conceives to be right will be determined only by what it thinks it can get.

Where is the fallacy? Why is it that, with the universal "passion for justice," justice never seems to be attained? Why is it that the world today has become utterly cynical on the whole subject? Why is it that the average citizen, even in America, is inclined to give up the struggle and ask, "What's the use?"

What We Really Seek

THERE is a reason. Until we understand that reason, we can do no straight thinking on the subject. When we do understand it, there is no reason why the thing we are really longing for should be longer delayed. The whole explanation was given 2,000 years ago, by a Man whom we crucified and forgot. He said:

"Ye have heard how it hath been said of old: An eye for an eye and a tooth for a tooth: but I say unto you, Resist not evil: but whosoever smiteth thee on one cheek, turn to him the other also. And if any man would go to law with thee and take away thy coat, let him have thy cloak also. And whosoever shall compel thee to go with him one mile, go with him two . . . . *Love thine enemies."* Not a trace of *justice* in a single clause. *But there is a perfect understanding of human nature.*

What we are all longing for is not justice but a more abundant life. That includes the prosecutor and the prisoner and the judge; the employer, the striker and the scab; the French and the German, the Bolshevik and the counter-revolutionist; the murderer and his victim; the artist, the lover, the babe in arms, the self-sacrificing mother; the prostitute and the dope fiend and the highway robber; the Jew, the Gentile, the 100-percent American and the utterest alien, black, brown, yellow or red. "Ye are all one family." You all have the same needs. You are all longing for the same thing: although the thing you are struggling for, because you haven't understood, is not the thing you are longing for at all.

When We Know the Truth

WE ARE longing for a more abundant life. In our ignorance, we imagine that this life can be realized through getting "our share" of what the earth provides: so we struggle for that share, and we are as happy as litigants in a lawsuit ever after. But here was a man who knew that human life could not be realized that way. He knew that the human being was not a bunch of appetites which can be satisfied with possessing things, *but a conscious energy which can be satisfied only in creative service.*

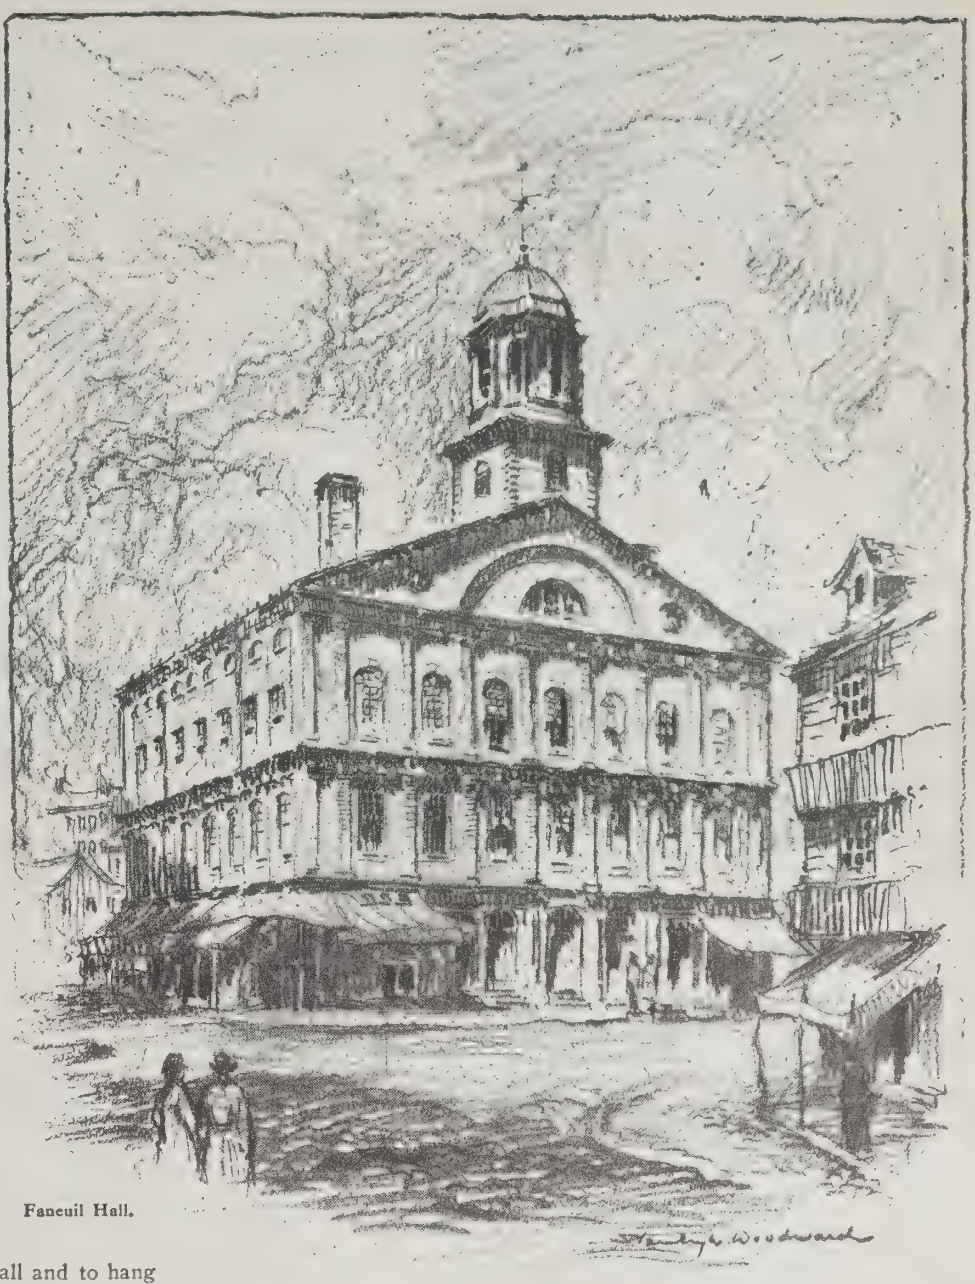
That being the case, it is impossible to try to harm another. One will just naturally love the other, regardless of such silly considerations as rights and wrongs. The human passions may then be expressed in all their force, and we may reasonably hope for definite results. We shall no longer be wasting this force in the idle pursuit of justice. We will not fool away our time in torturing and "punishing" others: in fact, we shall not sit in judgment upon them at all.

Jesus was sure that we wouldn't lose anything, either, in the long run. I can't say as to that. All I can say is that we have consistently lost everything in our stolid determination not to follow His directions. Believers in witchcraft will find it hard to understand this; but it may be, just as He said, that when we know the truth, the truth will make us free.

Faneuil Hall, Our "Cradle of Liberty"

No Place in Our Country Has Had So Much of the Dramatic in History as Boston Market

By MAY B. WHITING



Faneuil Hall.

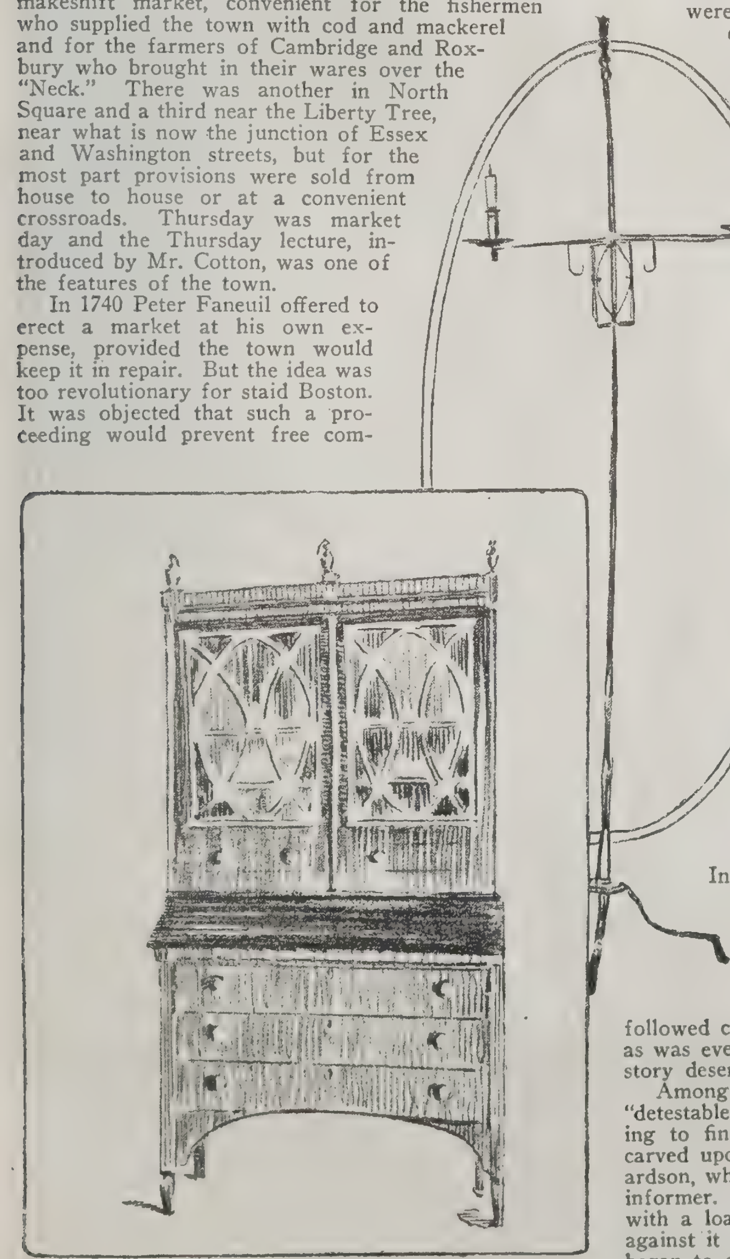
NO PLACE in our country has had so much of the dramatic, not to say melodramatic, in its history as Faneuil Hall. It is the outcome of an ideal, liberty of thought and speech, and the vigor of that purpose has preserved its youth. Today it meets the needs for which it was built, a market and an open forum, as well as when, in November, 1742, Peter Faneuil delivered the keys to the town of Boston.

The Faneuil family itself had a career that might grace the pages of a novel. Exiled from France during the Huguenot persecution, the brothers were admitted to the Bay Colony in 1691. Benjamin went to New York where he lies buried in Trinity churchyard and Andrew settled in Boston. He had no children of his own and took two of his brother's to bring up, designating the elder, Benjamin, as his heir, on condition that he never marry. But Benjamin sacrificed his prospects for the love of a Boston miss, prospered on his own account, and later in life inherited the bulk of the estate. Unhappily, the family were Tories during the Revolution and went to Canada, so that the name, except for memorials, disappeared from Boston.

Peter Faneuil, who, according to the terms of his uncle's will, never married, was known as the "Jolly Bachelor" and gave that name to his favorite ship. He was one of the richest merchants in Boston with a fine mansion on Tremont street, opposite King's Chapel, and, according to the Boston *News Letter*, he was the most public-spirited man, in all regards, that ever yet appeared on the northern continent of America."

He clearly saw that one of the greatest needs of the town was a public market. Winthrop's *Journal* tells us that as early as 1634 on the site of Faneuil Hall, then the head of the town dock, the court had established a makeshift market, convenient for the fishermen who supplied the town with cod and mackerel and for the farmers of Cambridge and Roxbury who brought in their wares over the "Neck." There was another in North Square and a third near the Liberty Tree, near what is now the junction of Essex and Washington streets, but for the most part provisions were sold from house to house or at a convenient crossroads. Thursday was market day and the Thursday lecture, introduced by Mr. Cotton, was one of the features of the town.

In 1740 Peter Faneuil offered to erect a market at his own expense, provided the town would keep it in repair. But the idea was too revolutionary for staid Boston. It was objected that such a proceeding would prevent free competition, and so close was the contest that when the votes were counted there were 360 against and 367 for accepting.



Above—Camp candlestick of the Revolution, in the Museum of Ancient and Honorables. Below—Antique desk in Museum of Ancient and Honorable Artillery Company, Faneuil Hall.

But while the hall was building public opinion changed. In many respects it was the most important edifice in Boston. It was made of brick, two stories and a half high, with open arches below and an auditorium that seated 1,000 persons. The town voted, in accepting, to name the building Faneuil Hall and to hang in it, as a memorial, a full-length portrait of the giver. Peter Faneuil consented to sit "for the drawing of his picture" and the Faneuil arms, carved and gilt by Moses Deshon, were added. George III sent his portrait, Governor Shirley presented his, and the town secured those of General Conway and Colonel Isaac Barré, both good friends of the colonies.

At once the Hall became the place for the discussion of every matter that concerned the settlement. The selectmen began to hold their meetings there and commissioned one of their number "to purchase two pairs of brass candlesticks with steel snuffers and a poker for the town's use." Strangely enough, the first of the long series of funerals held within its walls was that of its giver. Samuel Lovell, master of the Latin School, pronounced the oration, and the tower bell was tolled from one until the funeral was over. Peter Fanueil was laid to rest in the Granary Burying Ground where his tomb remains today, the much-prized coat of arms chiselled on the westerly corner.

Few men have left memorials more likely to keep their name alive. All the love of freedom of the Huguenot blood and the dramatic career of the Fanueil family were continued and reflected in the gift. In October, 1744, we read of a "concert of music" to celebrate the King's Coronation Day. In 1760 the hall was illumined in honor of the reduction of Canada. Only a few years later, citizens assembled, with overflow meetings in Brattle Street and Old South churches to make petitions to the King. In 1768 delegates from all the towns in the province met to discuss the possible arrival of British troops. Governor Bernard ordered them to disperse but the convention, with John Hancock presiding, continued its sessions.

From that time on dramatic episodes followed closely one after the other. As tense a scene as was ever enacted was the trial of Richardson whose story deserves the pen of a Hawthorne.

Among the few merchants who continued to sell the "detestable tea" was one Lillie, who awoke one morning to find a post set firmly in his yard, his effigy carved upon it. A crowd gathered, among them Richardson, who had the reputation of being a Tory and an informer. He vainly tried to persuade first a farmer with a load of wood, then a charcoal peddler, to run against it with his sled and knock it down. The crowd began to chaff him, and the boys, highly diverted, followed him home, pelting him with snowballs. Once within his own doors, Richardson opened a window and fired a shot into the crowd, killing young Christopher Snider, the son of a widow who lived in Frog Lane.

There never was a more impressive funeral in Boston. The body of the lad was placed beneath the Liberty Tree with Latin texts about it, all business ceased, and 600 schoolboys and more than 1,000 citizens followed in procession to the Granary Burying Ground. That might have taught the British the temper of the town, but it only angered them. A few days later occurred the Boston Massacre and one of the victims, Crispus Attucks, lay in Faneuil Hall, whence his funeral procession went to the Granary Burial Plot.

During the siege of Boston the Hall lost for a time its somber associations, for the British held cotillions and dramatic performances there. General Burgoyne, that soldier so debonair, wrote a farce, "The Blockade of Boston," and took a leading part. General Washington appeared with rusty sword and frowsy wig and his orderly with an old gun seven feet long. In the middle of the performance a messenger rushed on the stage shouting, "The Yankees are attacking our works on Bunker Hill." So well did this speech fit in with the acting that only laughter and applause followed. But stern orders were given that every officer ride in haste to Charlestown, and the play finished in confusion and tears.

The British merrymakings had a way of ending unexpectedly. Only a little distance from Faneuil Hall, in the Province House, Howe gave his last masquerade, where, in the midst of the festivities, the sound of a muffled drum was heard, and, among the mummers, descended a procession of the governors of the Bay Colony, old Governor Bradstreet leading them. No one ever knew the names of the masqueraders. Their identity was kept as closely as that of the participants in the Tea Party.

At the close of the Revolution the hall lost nothing of its prestige as a forum and a place to honor guests of the city. Washington, on his tour of the East, was fêted there, as was Lafayette on his visit in 1824. Slavery and anti-slavery were alike preached from its platform. Lincoln, Seward, Webster, Everett, Blaine, Wendell Phillips, Garrison, have found enthusiastic audiences, and Louis Kossuth sold Hungarian bonds there. Indians, with Black Hawk as their chief, were entertained and in return for the hospitality danced on the Common. In 1840 Mr. Cunard was banqueted on the occasion of his establishing steam connections between Boston and Liverpool, and a year later a grand ball was held in honor of the Prince of Joinville.

And the Hall and the Market have much the same appearance as when, nearly 300 years ago, Peter Faneuil presented the keys to the town. Yet they have not escaped the vicissitudes of time. In 1761 the interior was burned and rebuilt by money raised by lottery. In 1805 the Hall was enlarged under the directon of Charles Bulfinch who, as far as possible, preserved the original plan. About 20 years ago practically everything combustible was replaced by steel and stone.

The old portraits of Peter Faneuil and George III disappeared with the evacuation of the British, but a remarkable collection adorns the walls. Directly back of the platform is "Webster's Reply to Hayne" by Healy. The canvas is 16 by 30 feet, containing the

Immigration

SAM GOLDMAN must go back to Rumania. Sam had his final literacy test the first of April at Ellis Island. Three times Sam has had examinations before the psychiatrists and three times he has failed. An order for his deportation, received from Washington, was hailed by Commissioner Robert E. Tod as a great victory in the fight to overcome evasion of the Immigration Act.

No less a personage than Governor Alfred E. Smith, of New York, and several Congressmen, acting under pressure of an organized racial group, interested themselves in behalf of Goldman. This action led Commissioner Tod to declare that politicians and attorneys were sponsoring the entrance of the unfit, and "making a mockery of the law." He charged that high influences were being devoted to the case and large sums of money were being spent by parents and relatives to overrule the authority of the immigration department.

W. W. Husband, Commissioner General of Immigration of the United States, has said that an investigation had shown that of the people coming from the south and east of Europe less than 50 per cent, and in some cases as low as 30 per cent, had become naturalized in a given period, whereas of the old type of immigrants of the north and west of Europe more than 50 per cent, and in some instances 85 per cent, had become naturalized. He also stated that immigrants from the south and east of Europe have not demonstrated that they can be readily assimilated into the population of the United States in the sense that the old type of immigrants could.

A committee of the National Chamber of Commerce proposes to vest in the President a wide authority in selection of immigrants on a basis of demonstrated "social and economic needs." No such responsibility should be thrust upon the President. The legislative branch of the government should be responsible for the admission of immigrants. A complete cessation of immigration for a period of 10 years would give us plenty of time to assimilate our present enormous new population. Certainly this is no time to relax in this matter. A great deal of this misdirected energy might well be employed in bringing opportunities to the old-time Americans in the recesses of the Kentucky mountains. In this back country lives a race of Americans speaking the English of Chaucer, but apparently doomed to oblivion, living and dying with almost no intercourse with the great, broad world outside their mountain valleys. They were sidetracked in the great westward migration three generations ago and due to their isolation they lack progressive ideals. Yet from such stock came Lincoln and other great men. More attention should be given these mountain people.

Presidential Prognosis

PENNSYLVANIA'S perplexity in the matter of presidential preference, in the predominant party, forms a tempting opportunity for the humorist, especially the artist who delights in the task of seeking "alliteration's artful aid." Peter Piper's pepper picking would furnish a brief model for a clever manipulator of words and mixer of fact and euphony to work from and distinguish himself.

The facts, in plain phraseology, are substantially these: Pennsylvania, including Philadelphia, Pittsburgh, Pittston, Punxsutawney, and a host of minor municipalities whose initials would exhaust the matrices in a Mergenthaler in a single line, or the capitals in the upper case of any usual font of type in a paragraph, is not partial to the ambitions of the President to succeed himself. Ergo, it is up to the state to decide upon the course it will pursue in the next national convention.

Numerically the most powerful of the states except New York, her decision must carry great weight in the deliberations of the representatives of the Grand Old Party, provided they deliberate. This proviso is necessary, as usually such conventions are *pro forma,* the outcome being assured. The Harding supporters may be strong enough to make the nomination a foregone conclusion. He has the advantage of present possession, an unstained partisan record, and apparent satisfaction on the part of the real rulers of the country. His lieutenants are busy enlisting as many non-political interests as may be corraled without antagonizing others.

Pennsylvania's problem is to maintain an attitude which may save her face in any eventuality. She must be enthusiastic if she fails to unhorse the President, and be equally jubilant should some outsider capture the prize.

Two courses are open to her: to enter the convention uninstructed, or, as usual, to present a favorite son and give him solid support until the outcome is apparent, or can be decided by her vote.

Here lies Pennsylvania's perplexity and the opportunity for the alliterative artist to outdo Peter Piper with the same initial—P.

There would be no problem but for a multiplicity of politicians seeking to be cast in the role of Favorite Son. Among these, two individuals show above the crowd, possibly so prominently as to insure their disappointment. These are United States Senator George Wharton Pepper, idol of the reactionaries, and Governor Gifford Pinchot, professional progressive, both of whom received popular endorsement at the polls last year. These distinguished individuals already have their rods up in hope of attracting political lightning.

The danger is that a contest between these representatives of warring factions are apt to split the party in the state and render united action impossible, but the situation is such that alliterative genius may profit by it. Whether in prose or poetry, the possibility of linking Philadelphia, Pittsburgh, Punxsutawney, Pittston, Pepper, Pinchot, presidency, political patter, and other products a search of Webster might reveal, is such as to win attention.

"Marathon Dancing"

THAT is what it is called, although its only resemblance to a Marathon race is in the test of endurance, and there is no dancing at all—a mere shuffling of the feet on the floor certifying the contestant still to be in the struggle. No doubt the winner might be decided as was the champion disputant in the great debate on whether an implement was a pair of shears or scissors. The debate reached a point in vocal disability when the voices were mere whispers and the argument consisted of "Shears" on the one side and "Scissors" on the other and at last both contestants lost all power of speech, and fainted at the same time. The judges were about to call it a draw, when one noticed the right hand of one quivering. Close inspection revealed the fact that she was opening and closing the first and second fingers as if they were the blades of the instrument, and she was awarded the title.

The so-called "Marathon dance" is merely a money-making scheme of speculators who induce young people to furnish amusement for onlookers and sensational news for the press.

Sugar—Domestic and Export

A CORRESPONDENT of *The Financial Review* reports receiving a card from a brokerage firm quoting fine granulated sugar at $6.30 per hundred pounds f. o. b. New York. The same card quotes the same sugar for export at $6 per hundred. The explanation of *The Review* is that the reason for the difference is that Cuban sugars are refined in bond for export, hence pay no duty.

Here is another "Pittsburgh plus" in a different line. It is not necessary that the six-cent sugar for export be Cuban. It means that export sugar is sold at wholesale for 3.3 cents a pound less than the same sugar is offered for domestic consumption, whether imported or not.

Two facts are plainly seen in this difference: The domestic producer receives no benefit from the tariff, since his raw must produce a profit at the export price, while the domestic consumer pays the tariff, whether he uses domestic or imported. The refiner thus gets a "tariff plus" on his domestic supply

Soviet Gold in the United States

WESTON R. ESTES, formerly a captain in the United States Army Intelligence Service, is quoted by the New York *Herald* as asserting that $250,000,000 of Soviet gold is on deposit in the United States for the purpose of financing the propaganda of the Russian Internationale in its encouragement of the overthrow of our government.

The statement may be taken with a reservation, for several good reasons. In the first place, if the money is actually on deposit in this country, it would be a natural supposition that its purpose is the establishment of a credit for government purposes at home. Again, if it is not a government deposit, but an individual account, either private or in the name of the Internationale, it is not chargeable to the Russian government at all.

The statement of Captain Estes accompanies a denial on his part that Senator Borah correctly quoted him in naming a much higher sum when the Senator challenged him to name the banks in which the gold is deposited.

The plain duty of Captain Estes, if he has evidence of a plot against his government of this character, is to furnish the secret service with that evidence and have the matter investigated without publicity. In this manner only can the conspiracy be exposed, and those in the pay of the Internationale discovered.

A like duty devolves upon the banks concerned. The gold held is not available as an asset against credit liability, except as currency withdrawn gives the depositaries a lien. They must know the destination of withdrawals, and could serve the country by divulging their knowledge in confidence to a department maintained by the government as protection against such conspiracies.

Bird-Tree Day

THIS is the season when birds of various species and colors awaken us with their cheerful notes. The robin, swaying in the topmost branches of the maple, dominates birddom with his strong, aggressive personality. In early morning his voice rings out strong and clear, drowning the *tru-al-ly, tru-al-ly* of the softly whistling bluebird. Many of our bird friends fly thousands of miles to sunnier climates during the cold winter months, but return at the first hint of spring to renew old friendships. The red-winged blackbird greets us with his liquid *ke, kong-ker-ee,* from the willows and alders of the lowlands where he and his bachelor friends flock together to await the flocks of dingy, brown females who apparently are not so swift of wing as the handsome males. In the deeper and more remote woodlands one can hear undistinguishable voices that croon and coo like softly purling serf. The voices of the birds in the tall tree tops soothe the hearer and give him an appreciation of the sanctuary of the woods.

The announcement by the governor of Michigan that Arbor Day and Bird Day be combined, was good news to nature-lovers. Birds and trees are inseparable. An immense wave of interest in birds is sweeping over the country. The persistent and intelligent educative work of the Audubon societies is reaching school children, clubs, granges, editors and legislators. Likewise the question of reforestation and conservation is being recognized as of such importance that general interest is now aroused to the necessity of finding a solution. Arbor Day has come to mean much more than an opportunity to plant a tree or two on the lawn or along the street. The future destiny of American agriculture is bound up in this question of conserving our forest assets and bird life. No nation in the world that destroyed either ever survived. The program of conservation is not a simple one but it is not impossible by any means. We have made a good beginning even though we were slow in seeing the necessity of action. Our national conscience has been awakened by the demonstration of the birds' economic value to the country. We are devoting attention to the pressing necessity of preserving wooded areas in which the birds may nest and rear their young. The supply of our replaceable materials cannot be destroyed without a final day of reckoning, and that day is not far distant unless we make some effective move toward protecting the almost countless blessings which nature has given us in the form of birds and trees.

It is to be hoped that the commendable example set by Michigan's governor may prove the necessary "stitch in time"

Mr. Ford's Page

ANY sort of a fact is respectable, by reason of its being a fact. That a condition exists, that a situation has been reached, is of itself a matter of importance. Usually, however, our first reaction is in the region of our emotions—we say that the thing probably is true but it ought not to be true, the condition may exist but it ought not to exist; we do not adopt that wiser attitude of saying to ourselves, "The thing is here, and the fact that it is here has a certain importance as a fact."

It is by no means certain that the fact that a condition is present, is not very much in favor of it, regardless of what the condition may be. The fact that it is here is a very important fact. For nothing just "happens." If under human law "possession is nine points," then under natural law existence must count for at least as many points. The fact that a condition has been able to come into existence, to get itself actually spread out on the map of experience, is no small fact and requires us to accept its actuality.

Outside the region of physical distress there is perhaps no greater source of suffering today than just this inability to appreciate the importance of what could be most simply described as "the isness of the is," the existence of what exists. If we could lay it down as an initial agreement that what is here, is here by some law, is here for some reason, is here by some inherent right to be here, a great deal of humanity's mental confusion could be avoided. The plain fact that a thing is here, that a condition is here, has some bearing on the rightness of its being here.

Of course, not everyone will agree with this, especially in this way of stating it. As a general rule people wish to have it recognized that many of the things that exist are wrong, and they wish that the wrongness more than the existence should be emphasized. And yet, upon consideration it will be found that the fact of existence is too great to be thrust aside in that way—existence may amount to quite as much as the moral quality involved. That is to say, we are much concerned to bother ourselves about the truth of things and to censure the truth because we find it harsh, when we ought to recognize that truth is mostly unpleasant. What exists is true, but even the least thoughtful mind would concede that much of what exists is unpleasant. So that it is no guaranty of truth that it is pleasant to our palates. Truth is widely unpopular for no other reason than that it is usually very unpalatable. It is wholesome nevertheless, as bitter medicines are.

WHEN a condition actually exists the proper treatment of it is not resentment but understanding. The fact of its existence is a tremendous fact. Existence is more than nine points of the law. Whatever comes as far as that has some rights, at least some rightness, which we cannot very well disregard. Perhaps that is one of the simple truths the misconception of which has spread misunderstanding through the world. We live in an era of tremendous facts. And the facts are facts. They are also unpleasant facts, which does not decrease their factual percentage one bit. Our job is to understand them, to recognize their presence, to learn if we can what they signify and not to fall into the error of minimizing facts because they have a bitter flavor.

Take two facts which seem to be agitating the public mind today. One is the state of affairs across the sea. Eliminating the untruth, the propaganda, the calculated appeal to American soft-heartedness, there still remains the core of fact. And it is very simply determined. There is no mystery about it, because mysteries are hidden, and this condition is open to the eyes of men and to the sun. What the world is mostly suffering from today, in connection with the over-sea condition, is not the condition itself but the explanation of it. What the world is doing —that is, the honest portion of the world—is this: it is tearing its mind and heart into shreds by some mistaken notion that what IS should not be; that is, the world refuses to do the very simple thing of recognizing a fact. And somewhat worse than that is the tendency to misrepresent the fact in order to get rid of it. A resented fact is usually a misstated fact, and certainly there are few matters about which the general reading public is more misled than the condition overseas. Americans are probably the worst judges of this matter because their life affords no background of comparative judgment. Life overseas even now is not nearly so difficult as it sounds even when described by propagandists.

Here is the mental condition into which the American people have allowed themselves to be cast: They have observed a world condition, without accepting it; they have not recognized the world condition as being absolutely logical, the only thing and the only right thing that could occur; they furthermore have been misled into desiring that the condition should be suspended midway and not allowed to complete itself. That is perhaps the crux of the official misconception of the situation—the idea that what has been begun by righteous destiny can now be stopped by speeches, by money, or by legislative enactment. We have almost completely failed to recognize that when Almighty God hurls one of his facts abroad, men have to accept them, as men accept the sun and the moon and the stars—because they are there and cannot be removed.

We shall have less trouble about Europe when we begin this simple method of accepting facts as facts. This Page regrets to return to this subject as frequently as it does, but it is glad to note that the ideas insisted upon here are becoming more and more a part of American thought.

A more vivid illustration of this idea may be found in our own country, in the exodus of men from the farms. For a long time it has been almost fashionable to lament the fact that the farm population has been decreasing. The fact is a fact, but the conclusions that have been drawn from it are very questionable. Here is a case where we ought to learn once for all that when a condition occurs, our first duty is not to resent it and lament it but understand it.

Here, to take this example, is a fact: men are leaving the farm. Therefore, say alarmists, our food supply is threatened. Therefore, say other alarmists, the cities are destroying the foundations of our commonwealths. It is a very simple matter to take statistics and read into them all sorts of tragedy. But the main point is that the thing is occurring! Men are leaving the farm! It is a fact in the same category as the fact that Spring is coming and the meadows are greening again.

If we were not the victims of so many other people's ideas we would take this fact, and other facts in the same way, and we would give it a saner kind of treatment: we would say something like this—"Men are leaving the farms, so they say. Why should men leave the farms except perchance there be too many men on the farms? On the face of it, it looks as if farming has begun to catch up with other forms of industry and is perhaps cutting down on its overhead. Is this fact of men leaving the farm to be interpreted gloomily or hopefully?"

When anything of moment occurs it is the wiser course to look behind the occurrence for the cause, and thereby we shall learn much. In the instance just now related there is a great deal to learn. There is, for one thing, the reversion of many ideas we have entertained regarding the agricultural life. It is just possible that because of the crude methods in vogue, that particular industry has been overmanned. It is by no means true, as people have generally conceived it, that farming should need the drudgery which has accompanied it. With the adoption of better methods it is but natural that the overplus of men should become apparent, and the drift should begin. What we do not notice, perhaps, is the drift the other way, of city men toward the farm. There is a constant interchange going on—city men longing toward the land, farm men longing toward the cities. This means an interchange of experience and a better educated race. Instead of condemning what we see occurring we should seek to know why it occurs.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Vendors of Luck in Latin-American Countries

Lotteries, Races and Games Coax Money From All Classes

By CARROLL K. MICHENER

This is the fifth of a series of travel stories by Mr. Michener.

THE *suertero*—vendor of luck—is never far from one's elbow in the Spanish world. Sometimes this ubiquitous factor in Latin-American life, the purveyor of lottery tickets, is an able-bodied idler inhibiting his energies from some far more useful activity; as often the merchant is a tattered urchin or a mendicant old woman in a black *manto*. Frequently it seems that there are more sellers than buyers, and yet it is said that the lotteries are habitually well sold. In any case there are enough so that one who wishes to come to terms with fortune never has need to inconvenience himself in finding an opportunity. However ill-served the public may be in other respects, no complaint of insufficiency can be made in this.

From the prevalence of the lottery and other kindred mechanisms of chance it is easy to arrive at the conclusion that gambling is not only one of the major enterprises of South America, but its chief sport. Athletic games, of which there are many, appear to exist not from such classic motives as those of the lusty old Greeks, but to provide a convenient and attractive means of deciding bets.

If the bullfight retained in South America the vigor it enjoys in Spain, this statement would be less of a generality, for the sanded arena offers little occasion for a wager. The devotees there are sanguinary *aficionados*—unalloyed fans who for the moment are forgetful of all save mad pleasures of the most elemental combat, that between man and beast. But "blue laws" have settled their shadows over the bull rings of South America, and today there is no place outside Peru, Bolivia and Chile where the old battles of blood and sand may be seen.

Amateur games, of course, do not lend themselves readily to the decision of wagers, but these are exotic to the soil and not yet firmly established. A hint of this will impress the tourist in Havana who allows himself to be lured into a gambling joint advertising exhibitions of "Cuban Lawn Tennis." He will find there a cement court in the midst of a covered amphitheater equipped with all the betting paraphernalia of a race course. A dozen or more young women, mere tyros at the game, but of sufficient pulchritude to command masculine attention, will be seen going through the motions of tennis. But certainly it is not upon the game itself, but upon the quick arbitrations of the unskilled racquets of Carmen or Luisa, that the interest of the spectators will be seen to rest.

Gambling, of course, is a Latin passion. The New World descendants of old Spain come by it honestly. But nowhere, unless in China—or Louisiana—does it attain such general proficiency as in South America. Probably it would be difficult to find an inhabitant not addicted to some of the many accessible forms of it. The habit begins with earliest youth and persists through old age. Children gamble with the ice cream man for something or nothing, and an urchin, at the races, plays his tips like any elder.

The lottery, the bookmaker and the casino in the United States are by no means beyond the memory of the oldest inhabitant, but these diversions never have had in this country the general devotion accorded them by the entire Spanish world. So universal is the habit that most of the governments long ago seized upon it as a taxable asset. Lotteries, therefore, are usually enterprises of the state, parading sometimes under the name of a charitable institution that is either a real or a fanciful beneficiary. The government, in any case, is the largest and the surest winner, and millions of dollars annually go into the treasury from this. source.

There is a curious inconsistency in this practice in the case of Cuba, whose first plea for independence was based to a large degree upon an aversion to the Spanish lottery. The republic suppressed this racial sport for several years, but finally gave up. It still prohibits the importation of tickets from Spain, but is content to fatten its public revenues by lotteries of its own.

The gambling proclivities of Cuba escape into many channels, and baseball, contagious from the neighboring continent, has been adapted to these requirements. The speed of the game, and its constant production of decisive incidents—a hit, a run, a stolen base, a strike or a ball—give it considerable vogue among those whose money is restive under too leisurely exchange.

This is true also of *jai alai*, the Spanish ball game, which is something of a glorified handball. It is played in a long, rectangular, three-sided court, with a pellet resembling a golf ball, which is made to bounce and ricochet from the walls, with an amazing speed, by means of a curious wooden bat shaped like a slender spoon and attached like a talon to one hand of each player.

Great skill and strength are required in catching and hurling the ball with this implement, and there is a short but keen suspense between critical points, admirable for rapid betting.

The tremendous vocal enthusiasm that is to be heard from the spectators during this game is by no means to be attributed chiefly to an appreciation of its fine points, but rather to the curb market hysteria of bookmaking and the frenzy with which betting partisans curse or encourage the players. The score board is relatively of far less importance than the winning dividends, posted with all the careful formality of quotations on a stock exchange.

Jai alai has attained a vogue on the continent of South America as well as in Cuba, where it has a popular appeal that brings out from Spain the most renowned of professional players. The social atmosphere of Havana's Nuevo Fronton is almost as pronounced as that of the race course at Marianao. Narrow rows of boxes, high up in the spectators' gallery along one steep side of the theater, blossom nightly with gorgeous and somewhat overdressed feminine élite. The women rarely wander away from the shelter of these *palcos*, and their inevitable betting must be done by escorts.

The bullfighting of South America, like that of Mexico, is reputed to be of a melancholy complexion, even when occasional matadors of renown come barnstorming from Spain. The difficulty lies with the bulls, which have no such man-killing dispositions as those of Murcia or Estramadura. Not infrequently they turn tail and bellow for quiet pastures, preferring their appointed slaughterhouse to the unseemly clamor and publicity of the arena.

Driveway entrance to a now disused casino at Buenos Aires.

The cockfight, as well as the bullfight, shows some evidence of diminishing vigor. It is under a more or less official and social cloud. Nevertheless it still has its fanatical devotees, clutching dandified birds with legs plucked of feathers as if for the Sunday pot, and howling livid curses and exhortations as their unhappy charges chase each other breathless or peck each other into a blind, bloody mess. The impromptu group surrounding a cockfight, and more especially the amphitheater of an organized exhibition, has a good deal of likeness to a wheat pit in the closing days of an option. It is staccato with offers of betting odds, which grow shrill and insistent with some sharp corner in a gamecock's fortunes; or it is hushed to an agonized and bewildered expectancy when the combat reaches some tense and indecisive moment.

But for the essence of luck-pursuit, nothing quite equals the lottery. For the risking of a few coppers it offers a fabulous reward. A whole ticket, costing $20 or $30, has the chance to bring home from $100,000 to half a million. And even the comparatively indigent are placed within reach of some part of such a fortune through the purchase of a *piece*, or the fraction of a ticket.

There are hundreds of smaller prizes, of course, and he who has not the consolation of *el gordo*, the "fat one," may receive a dollar, or ten, or a hundred, in compensation for his hazard. For the vast majority, however, there is rarely more than the habitual sneer of fortune. It is a game in which the dice are heavily loaded, yet the size of the capital award is so dazzling as to blind the average person to this inequality. As in any organized game of chance, the only sure reward is that of the house. And in the case of the South American lotteries, the house is the government and its horde of operators and ticket sellers, drones who must be supported by the gambling public at the cost of wasteful millions.

The sound moral and economic argument that has been built up against gaming in general and the lottery in particular is too familiar to need rehearsal. The South American, hearing it, shrugs his shoulders as at some well-known but unpalatable fact. His only justification of it is likely to be the wink with which he explains its value as a source of public revenue.

The lower levels of life in South America are far less fortunately cast in all respects than similar degrees of living in the northern continent. Without the lottery, no doubt there would be imaginations infinitely more undernourished and anemic. But on the other side of the ledger is always the upsetting calculation of how much the general economic stratum might be raised if romancings on possible wealth were to be translated into uplifting effort—if self-help were to be relied upon instead of the caprice of Dame Luck.

Less is to be said against the casinos—more than one of which is a government enterprise conducted in the name of charity—and the numerous baccarat and roulette clubs. These are playthings of the rich, or of those who presumably can afford to lose, and they keep unwieldy accumulations of wealth flowing back into channels of general distribution. Particularly is this true of the costly gambling palaces of Montevideo, which draw ungainly sums of money across the river from Buenos Aires, where this form of amusement is under the official frown.

In something of the same category is the race course, with its elaborate machinery of chance. It is not wholly a plaything of the rich, for there are entrance fees and betting tickets to suit any financial degree; but its appeal is narrower than that of the lottery, and it is less accessible to the mass.

Horse racing in the Spanish world is something of an imported institution, and it is by no means without significance that the most flourishing of South America's race courses are to be found in those communities that have been most closely concerned with the British business man and engineer. An unmistakable evidence of this influence lies in the personnel of Antofagasta's sporting club and in the ownership and nomenclature of the horses.

Chile and Argentina, of all the South American republics, are most ardently devoted to the track, and every important city has its *hipódromo*, as large and as luxurious as it is within the local means to procure. In the case of Buenos Aires, whose jockey club is one of the wealthiest of its kind in the world, this *lujo*, to use the colloquial expression, takes the most extravagant form, and the race course and its pavilions are in many respects unrivaled.

Great as is the genuine sporting interest in events of the track, as evidenced in the voluminous publicity given to the races in the press, it is in its character as a social institution and as an outlet for the Spanish-American passion for gambling that the track finds its greatest vogue. The jockey club of Buenos Aires, on its percentage of the receipts from the pari-mutuel betting system, has reached a pinnacle of bewildering wealth. Its $3,000 membership fee is only an additional embarrassment to the club's treasurer, for there is an eager waiting list of new-made Argentine millionaires who are not at all chagrined at such an amount.

The dice box did not vanish with the late lamented saloon in the United States, nor have American military regulations been capable of entirely quieting the voice of the galloping domino. But not in its most unprohibited days did this diverting institution flourish north of the Rio Grande as it does in South America. Thirty or forty dice boxes on the counter of a single club bar are not considered excessive. The arbitration of the little cubes is in demand on most occasions, trivial or grave. It is the reputation of the peon that he will gamble for anything whatsoever, at cards, dice, throwing the knuckle bone, or a dozen and one other expedients for shifting the responsibility of decisions on the goddess of fortune.

There is, of course, a dissociation of gambling from sports in the amateur athletics that appear to be catching on slowly. This field of diversion has already widened sufficiently for a periodic South American Olympic, and there are occasional international meetings in tennis, notably between Chile and Argentina. Of all the amateur sports, tennis, no doubt, holds first place in popular favor.

North American baseball is practically unknown, but golf, in recent years, has made rapid advances. Travelers are a little surprised at the prevalence of this sport from Panama southward. There is a collection of courses in the Canal Zone, one at each of the three locks, looking very hot under the tropic sun. They are narrow, and some of them have sand greens, but they seem to be much used.

In the inland cities of the Andes, fencing and riding still have their devotees, these being the traditional exercise of a Spanish gentleman. The middle class, or rather the mixed population, takes to the modern sports far more readily than the aristocratic element with its *hidalgo* background of old Spain.

Ancient Scholars' Strong Views on Interest

By DR. JOHN JEWEL, Bishop of Salisbury, A. D., 1560

HERE will I speak somewhat of the unhappy trade of usury, because therein standeth the most miserable and shameful deceiving of the brethren. I will not speak all that may be said; for it would be too long and over wearisome. I will shew you, first, what usury is; then, whence it springeth, and what are the causes of usury; thirdly, what cometh of it, what hurt it worketh to the commonwealth; and I will lay forth such reasons as may make any good man abhor it; then I will declare what the holy fathers, and the apostles, and martyrs, and Christ, and then God himself, have thought and spoken of usury.

Many Had Not Even Heard of Interest

Many simple men know not what is usury nor ever heard of the name of it. The world were happy if no man knew it: for evil things do less harm when they be most unknown. Pestilences and plagues are not known but with great misery. But that you may learn to know it, and the more to abhor it, this it is:

He Defineth Usury

Usury is a kind of lending of money, or corn, or oil, or wine, or of any other thing, wherein, upon covenant and bargain, we receive again the whole principal which we delivered, and somewhat more for the use and occupying of the same: as, if I lend 100 pounds, and for it covenant to receive 105 pounds, or any other sum greater than was the sum which I did lend. This is that which we call usury: such a kind of bargaining as no good man or godly man ever used: such a kind of bargaining as all men that ever feared God's judgment have always abhorred and condemned. It is filthy gains and a work of darkness. It is a monster in nature, the overthrow of mighty kingdoms, the destruction of flourishing states, the decay of wealthy cities, the plagues of the world, and the misery of the people. It is theft, it is the murdering of our brethren, it is the curse of God and the curse of the people. This is usury. By these signs and tokens you may know it; for wheresoever it reigneth all those mischiefs ensue. But how and how many ways it may be wrought, I will not declare. It were horrible to hear; and I come now to reprove usury, and not to teach it.

Let us see then what is the cause hereof, and whence it groweth, who is the mother, the nurse, or the breeder of usury. For it groweth not everywhere, nor among all men. Many hate it and detest it, and had rather die than live of such spoil. It is not of God; for God strictly forbiddeth it. Neither is it found among the children of God; for love seeketh not her own profit, but to do good to her neighbor.

He Waxeth Warm Denouncing It

Whence then springeth usury? Soon shewed. Even thence, whence theft, murder, adultery, the plagues and the destruction of the people, do spring. All these are the works of the devil and the works of the flesh. Christ telleth the Pharisees: "You are of your father the devil, and the lusts of your father you will do." Even so may it truly be said to the usurer: Thou art of thy father, the devil, and the lust of thy father thou wilt do; and therefore thou hast pleasure in his works. The devil entered into the heart of Judas, and put in him this greediness and covetousness of gain, for which he was content to sell his Master. Judas' heart was the shop: the devil was the foreman to work in it. St. Paul saith: "They that will be rich fall into temptation and snares, and into many foolish and noisome lusts, which drown into perdition and destruction. For the desire of money is the root of evil."

Covetousness, desire of money, insatiable greediness, deceitfulness, unmercifulness, injury, oppression, extortion, contempt of God, hatred to the brethren, and hatred of all men, are the nurses and breeders of usury. It springeth from Satan, and groweth, and is watered, and fed, and nourished by these cruel and damnable monsters.

Let us see further what are the fruits which come of usury. For perhaps it doth some good, and you may think that many are the better for it. These therefore are the fruits. It dissolveth the knot and fellowship of mankind: it hardeneth man's heart. It maketh men unnatural, and bereaveth them of charity and love to their dearest friends. It breedeth misery and provoketh the wrath of God from heaven. It consumeth rich men, it eateth up the poor, it maketh bankrupts, and undoeth many households. The poor occupiers are driven to flee, their wives are left alone, their children are helpless and driven to beg their bread through the unmerciful dealing of the covetous usurer.

One asked of Cato, "What is it to commit usury?" "What is it," saith he again, "to kill a man?" He that is an usurer is a murderer. The same Cato saith: "Our fathers punished a thief with payment of the double of that he had taken; but the usurer was always condemned to pay four times the value." They were wise men. They thought that an usurer was much worse than a thief.

> "If I have been deceived in this matter, O God, Thou Hast deceived me. Thy word is plain—*'Thou shalt take no interest.'*"—Dr. John Jewel, Bishop of Salisbury.

The Bishop Would Be Unpopular Today

For a thief is driven by extremity and need; the usurer is rich, and hath no need. The thief stealeth in corners and in places where he may be unknown; the usurer openly and boldly, at all times and in any place. The thief, to relieve his wife and children; the usurer, to spoil his neighbor and to undo his wife and children. The thief stealeth from the rich, which have enough; the usurer from the poor, that hath nothing. The thief fleeth and will be seen no more; the usurer standeth by, continueth, and stealeth still: day and night, sleeping and waking, he always stealeth. The thief repenteth of his deed, he knoweth he hath done wrong, and is sorry for it; the usurer thinketh it is his own, that it is well gotten, and never repenteth nor sorroweth but defendeth and maintaineth his sin impudently. The thief, if he escape, many times becometh profitable to his country, and bestoweth himself painfully in some trade of life; the usurer leaveth his merchandise, forsaketh his husbandry, giveth himself to nothing whereby his country may have benefit. The thief is satisfied at length; the usurer hath never enough. The belly of the wicked will never be filled. As the sea is never filled with water, though all the streams of the world run into it; so the greediness of an usurer is never satisfied, though he gain never so unreasonably. The sea is profitable; the usurer is hurtful and dangerous. By the sea we may pass, and come safely to the haven; but no man passeth by usury without loss or shipwreck.

The Good Ambrose Crieth Upon Usury

Ambrose saith: "He that lacketh wherewith to keep life, payeth usury. What heavier case may there be? He seeketh to be healed, and you poison him; he asketh bread, and you give him a knife; he desireth you to set him at liberty, and you bring him to further bondage. . . . Thou, usurer, growest wealthy by other men's heaviness: thou makest gains of their tears and weeping: thou art fed with their hunger: thou coinest thy money with the skins of those men whom thou destroyest: how thinkest thyself to be rich, and yet beggest an alms of him that is poor?" Ambrose saith further: "Whomsoever it is lawful to kill, thou mayest lend him thy money to usury." For he that taketh usury killeth without a sword. These be holy fathers, and worthy of credit: they show us that usury is as bad as to kill and murder a man wilfully.

Chrysostom saith: "Even as a little leaven leaveneth the whole lump of dough, even so, usury, when it cometh into any man's house, draweth all his substance, and changeth it into debt."

They Did Cast Out the Usurer

He that is an usurer wisheth that all others may lack, and come to him and borrow of him, that all others may lose, so that he may have gain. Therefore our old forefathers so much abhorred this trade, that they thought an usurer unworthy to live in the company of Christian men: they did excommunicate him. They suffered not an usurer to be a witness in matters of law. They suffered him not to make a testament, and to bestow his goods by will. When an usurer died, they would not suffer him to be buried in places appointed for the burial of Christians. So highly did they mislike this unmerciful spoiling and deceiving our brethren.

But what speak I of the ancient fathers of the church? There was never any religion, nor sect, nor state, nor degree, nor profession of men, but they have disliked it. Philosophers, Greeks, Latins, lawyers, divines, heretics, all tongues and nations have ever thought an usurer as dangerous as a thief. The very sense of nature proveth it so. If the stones could speak, they would say as much.

Therefore our Savior saith: "Do good, and lend, looking for nothing again." He saith not, Lend, and look not for your principal again: but Look for no gain thereby, look not to receive more than thine own for the use and occupying of it.

The scorpion embraceth a man sweetly with his legs, but in the meanwhile striketh him deadly with his tail: his face looketh amiable: his tail poisoneth. So an usurer looketh fair, and giveth good words; but at the end he undoeth."

Who is stung by an adder, he perceiveth no hurt, but feeleth a gentle beating of his veins with some delight, whereat he rejoiceth. After this he falleth into a slumber: then the poison worketh, overcometh him, and killeth him. Even so he that borroweth upon usury findeth himself wonderfully amended, and rejoiceth; but he is stung, and hath a deadly stroke. The poison will grow over him: he shall die in a slumber, and be undone before he is aware. So necessary is an usurer for to relieve the poor and needy, as rust is to help iron, and as moth is to help a garment: it eateth him through from one side to another. Therefore saith Ambrose: "Such are the benefits that you rich men bestow; you give out little, and require much again. Such is your kindness, that you undo them whom ye help."

And thus much of the ease that poor men find in borrowing upon usury. They are bitten, and stung, and eaten up and devoured by it. Most men confess that this kind of usury is forbidden, because it relieveth not, but spoileth and consumeth. God take the liking of it out of all men's hearts! Then shall they be the better able to judge of the other sorts, which they yet think allowable.

Some will say, I have no trade to live by: I must needs give my money to usury, or else I must beg. This is that I spake of: this sheweth that despair and mistrust in the providence of God is the mother of usury. If this were cause why he should be an usurer, why may not the thief, or the bawd, or the enchanter, by like answer excuse themselves, and stand in defense of their doings? Augustine therefore saith: "The usurers are bold to say they have no other trade whereby to live. So will the thief tell me, when I take him in his theft. So will the bawd say that buyeth young maidens to use them to filthiness. So will the wicked enchanter that selleth his sin. As if they were not therefore most worthy to be punished, because they have chosen a trade of wickedness to live by, and will maintain themselves by that thing wherewith they displease Him by whom all are maintained."

The Bishop Valiantly Stands to His Duty

Thus much I thought expedient to speak of the loathsome and foul trade of usury. I know not what fruit will grow thereby, and what it will work in your hearts. If it please God, it may do that good that I wish. I have done my duty: I call God for a record unto my soul, I have not deceived you. I have spoken unto you the truth. IF I BE DECEIVED IN THIS MATTER, O GOD, THOU HAST DECEIVED ME. Thy word is plain. Thou sayest, "Thou shalt take no usury": thou sayest, He that taketh increase shall not live. What am I, that I should hide the words of my God, or keep them back from the hearing of His people? The learned old fathers have taught us it is no more lawful to take usury of our brother than it is to kill our brother. They that be of God hear this, and consider it, and have a care that they displease Him not. But the wicked, that are no whit moved, and care not what God saith, but cast His word behind them, which have eyes and see not, and ears and hear not; because they are filthy, they shall be filthy still. Their greedy desire shall increase to their confusion; and as their money increaseth, so shall they increase the heaps of their sins. Pardon me if I have been long or vehement. Of those that are usurers I ask no pardon.

Hark You This! Your Names Shall Be Told!

I hear that there are certain in this city, which wallow wretchedly in this filthiness without repentance. I give them warning in the hearing of you all, and in the presence of God, that they forsake that cruel and detestable sin. If otherwise they continue therein, I will open their shame and publish their names in this place before you all; that you may know them, and abhor them as the plagues and monsters of the world; that if they be past all fear of God, they may yet repent and amend for worldly shame.

Tell me, thou wretched wight of the world, thou unkind creature, which art past all sense and feeling of God, which knowest the will of God, and doest the contrary, how darest thou come into the church? It is the church of that God which hath said, "Thou shalt take no usury" and thou knowest He hath said so: how darest thou read or hear the word of God? It is the word of that God which condemneth usury; and thou knowest He doth condemn it: how darest thou come into the company of thy brethren? Usury is the plague and destruction and undoing of thy brethren; and this thou knowest: how darest thou look upon thy children?

Australian Packs London's Famous Temple

Meteoric Career of Man From the Antipodes Who Succeeded American in England's Most Noted Pulpit

By PAUL TYNER

The REV. F. W. NORWOOD, D. D.,

Minister of City Temple, London, and, at the left, the City Temple.

THE City Temple Congregational Church down in the "City" near Holborn Viaduct, London, was founded 'way back in 1640, and so is more than a century older than the American Republic. But it was not until 1873 that the present edifice was built to accommodate the steadily increasing crowds drawn by the eloquence of Joseph Parker. During his pastorate of nearly 30 years he was recognized as the most brilliant preacher in England and hardly second in popularity to his famous contemporary, Charles H. Spurgeon, pastor of the Tabernacle. To this day, the City Temple holds much the position among the English dissenting churches that Plymouth Church in Brooklyn does among Americans. Parker, indeed, was distinguished as a strong friend of America, and especially of the North during our Civil War, when it took a brave man to espouse the Union cause in England. Over and over, Henry Ward Beecher spoke from the City Temple pulpit during his visits to London—and that as far back as the days when no other pulpit was open to him and when, as an Abolitionist, he faced turbulent mobs armed with stale eggs and cabbages whenever he attempted to address popular gatherings. These mobs blamed the North for the blockade of southern ports that kept cotton from reaching Lancashire and threw thousands of operatives out of work. Parker, undaunted, draped the Stars and Stripes, entwined with the Union Jack, in front of his pulpit. And he did not wait for Lincoln's death to eulogize our war President in an eloquent and touching tribute to his genius and courage.

To this day, the marble bust of Joseph Parker in the vestibule of the City Temple is draped with the American flag on one side and that of Britain on the other. For three generations the church has enjoyed a place all its own in the affections of visiting and resident Americans. This was true during the ministry of Dr. R. J. Campbell, of "New Theology" fame, who after 20 years here went back into the Anglican church and during that of his successor, Dr. Joseph Fort Newton.

The church itself is built on the plan of a Greek temple with classic portico and proportions, save that at one corner there is a tower to which Parker, when it was added, gave the name of "The Lincoln Tower." A spacious gallery runs around three sides of the edifice and the seating capacity is about 3,000. It is exceptional among English churches in that there is no "pulpit" and that a cheery effect is given to the interior by white and gold decoration of the gallery balconies. At the east end is the organ in brilliant gold picked out in a tasteful floral design. In an opening between the banks of organ pipes is a fine rose window The church is lighted (when there is any sun in London) by translucent white windows, the only stained glass besides the rose window being a series of crescent-shaped glass panels filled with allegorical designs of a modern enough sort running all around the walls just below the lofty roof. In place of a pulpit, the reading desk occupies a projecting elevation at the east end of the main gallery just under the choir gallery. This reading desk elevation is occupied by the minister when he is officiating and by the secretary when he reads the announcements. The choir—a vested choir, by the way—consists of some 30 women and half as many men standing in tiers one above the other. And the music at the Temple is always of the best order. They are nearly as proud of their music as they are of their preacher, and with good reason. The service indeed would be considered an elaborate one in a Congregational church in America. But all the choral music, chants, hymns, psalms, introits, anthems, and so on, drop out of sight when the sermon begins. It is usually preceded by a few moments of silent prayer. Then all the attention of the immense congregation (you have to be there a half-hour ahead to be sure of a seat) is focused on the preacher.

Even before he begins speaking, Frederic Norwood impresses one by a personality which is commanding in a sense beyond that usually indicated by that much-abused adjective. Tall and well built, his figure is set off by the black silk doctor's robe with cherry-colored collar and lining. His square head with thick thatch of black hair, clean-shaven dark face, massive jaws and the glint of bluish gray eyes that look through eyeglasses with something of the direct penetrating gaze of Roosevelt, all indicate strength and vitality. He has a well-modulated and musical voice with great carrying power, and Forbes Robertson might envy the clearness and deliberation of his enunciation. Dr. Norwood makes few gestures, and those that he makes convey distinct point and emphasis. Both in voice and manner, he is much more like an American than an Englishman. In a chat I had with him after the service in his comfortable library at the church, I told him I should have taken him for an American. This he accepted as a compliment, saying that it had frequently happened and that in his experience he found that there was much closer resemblance, not only in outward appearance and manner but in spirit and mentality, between Australians and Americans than between Australians and Englishmen. "England is a small and old country," he went on, "while both America and Australia are large and new countries, and that means certainly larger freedom and vitality in the make-up of their peoples."

His topic that morning had been "Increasing Sustenance," his text being, "Man shall not live by bread alone, but by every word that proceedeth out of the mouth of God." His treatment was boldly new and broad. "Bread," in the conception of the old Hebrew prophet whom Jesus quoted eight centuries after, was one of the words of God. It was one of the perpetual miracles of nature. But the saying had been spiritualized and vitalized by Jesus. Originally, the miracle of bread from heaven had simply the superficial interpretation of the miracle of the manna in the wilderness. The Jews believed in miracles and were fond of them. To Jesus, the extraordinary became ordinary, for He commanded through spiritual understanding Nature's laws and forces. He was a spiritual genius, and there are no limiting laws for genius. The forces of nature in the hands of genius differed as music in the hands of a master differed from music handled by a clown. Jesus was supposed to be able to make bread out of air. But this He refused to do at the behest of the Tempter, quoting a very old saying which He clarified giving it an ampler meaning than the old Hebrew dreamed of. Our daily bread is the Word of God.

I will not attempt to report the sermon in detail, but here are a few striking extracts that seem to me to convey luminous specimens of the thought and the style of this new preacher who reminds old-timers of Joseph Parker and of Henry Ward Beecher, but whose individuality is all his own and has in short space established him in the front rank of English-speaking preachers:

"Man with all his cleverness has never been able to produce his own daily bread. Bread is no mere fortuitous concourse of circumstances, but is in truth the very thought of God."

"Alas that we make this thought of God the very object around which center all our hates, strifes and rivalry! It should not be competed for, but shared. The fire needed to bake it is the symbol of home. On what was this great city built, but the central idea of bread-winning, which is the object of all our industry?"

"All our shops, factories, railways are based in the last analysis on this idea of God—Bread."

"Industry when perfected is co-operative and not competitive. Co-operation means mutual, understanding and mutual effort; that means Love—and Love is God."

"Civilization just now is a water-logged thing drifting on the rocks."

"When we ask for daily bread, we demand not merely material food, but also homes, music, books, pictures, railways, telephones, wireless—and human fellowship. All these things are God's words. They did not mean as much to our fathers because their ears had not been attuned to catch them. They will mean more to our children because their ears will be attuned beyond ours—perhaps communication with other planets. I place no limitation on human progress; on God's ever-continuing revelation of His thoughts."

"Every discovery and invention is God's speech to man. They are all part of the growing sustenance man needs for his development and which God provides."

"The way of bread alone is the way back to the jungle. We are too deeply concerned about mere primary things; too blind and deaf regarding the words God is ready to give for our relief and sustenance."

"The world is spiritually impoverished, and that is the reason for its present wretched condition. It is a condition that cannot be cured by mere mass movements, by legislation or more wars. The greatest contribution each of us can make to human betterment is to shape our own daily lives by the spiritual idea. Take this idea into business and we shall have real and lasting prosperity. It may not be possible for all of us to do this in its fullness right now; but that is no reason why we should not make the attempt and begin."

But Dr. Norwood is far from being a man of one idea. He is a thinker with a trained brain and, in addition to wide reading, he has had a varied contact with all sorts and conditions of men. This has given him, with versatility, a gift for searching the hearts of his hearers. His philosophy is racy of the soil and inspired by a humanness gained in the "University of Hard Knocks," rather than from books of college teachers.

On the occasion of my first talk with Dr. Norwood (his old college in Adelaide, Australia, has made him a D. D. since he became pastor of London's City Temple), he had only been out of bed a week after seven weeks of invalidism following an operation for appendicitis; but he looked very fit, save for a slight pallor, and was inclined to make very light of his illness. "I had never been sick a day in my life," he said, "and the thing came on me very suddenly following a rather strenuous season of work. I have been rather lavish in my help to other churches and am still under promise to preach two or three times a week in various places in addition to my two Sunday sermons at the City Temple."

I mentioned that a friend who had heard him in Detroit when he made a tour from Vancouver to New York had hinted to me that he had a remarkable story.

He smiled, saying, "I don't know about that. Sometimes other people see something remarkable in a man's story when it does not seem to himself to be remarkable. But such as it is, I shall be glad to tell you all about it."

And very simply he chatted away for an hour quite at his ease and in the voice which can be as caressing as it can be commanding.

Boiled down, here is the tale that he told. He was born about 47 years ago in Bendigo, Australia, the mining town made famous by the gold rush of the late sixties. His parents on both sides were of Irish blood, although his mother was born in Australia. They had been among the gold seekers. "They did not get any gold," he said laughing, "all they got was me and five sisters and brothers."

When he was 10 years old, his father died leaving his mother with six children to look after and not a penny to do it with. So Frederic had to leave school, and got a job as office boy in a motor cycle factory in South Adelaide, where the family had moved from Bendigo. He got on so well that he was made secretary and assistant manager of the company by the time he was 27. His mind at that time was set on a business career and he worked hard, learning all he could of business and "dreaming of becoming some day a millionaire and captain of industry."

He smiled reminiscently as at the foolishness of that old ambition in comparison with the very different career which Fate had in store for him.

"All the same," he went on, "I would not have missed

Sky Land in the Heart of the Blue Ridge

Hundred Mountain Peaks a Mile High Scattered Over a 90-Mile Radius

By GEORGE H. DACY

IN THE heart of the Blue Ridge Mountains of Western North Carolina, where dignified peaks tower to the clouds placed like natural sentries on guard, is "Opportunity's Empire." Such is the name given to the region where the sunrise and sunset are the most beautiful to be seen, where the climate is moderately warm in winter and deliciously cool in the summer. Here, too, is the city of Asheville, a health resort whose fame has been heralded across the seven seas. Health-seekers, as a class, are critical and difficult to satisfy. One indication that Asheville is out of the ordinary as a health center is found in the fact that more and more newcomers and former visitors come each season. The latest records show that more than 300,000 visitors visit Asheville and leave $54,000,000 annually in the city.

Asheville is a community the majority of whose homes is open to the public. There is probably no city of the size in the United States that has less idle living accommodations than this southern center which, of necessity, has had to open all its homes to accommodate the thousands of tourists and health-seekers.

The transformation of this sleepy southern town into a bustling business headquarters and a vacationists' rendezvous is strikingly shown in figures. In 1910 the total assessed value of city property amounted to $10,000,000. At present it exceeds that figure by 600 per cent. A decade or so ago there was not a single mile of paved rural highway in the sections that adjoin Asheville. Today, there is more than 164 miles of excellent macadam and concrete roadways leading from the center of the city. In addition, there are several hundred miles of well-maintained gravel and earth roads that link up with the network of permanent highways. Six years ago, the daily milk supply of the city aggregated 1,700 gallons and was about as poor and insanitary as could be found in any section of the South. Today, Asheville folk consume more than 6,000 gallons daily of a nutritious and sanitary milk second to none.

There was a time when it took a stronger beverage than milk to satisfy Asheville people. The old records show that during the first quarter-century of the city's history every well-to-do resident owned and operated his private whisky or brandy still. Even the ministers of those days made and sold liquor. That was in the era when water was used principally as a fluid for ablutions. Men slaked their thirsts from the contents of little brown jugs that were commonplace in every home. Curiously enough, John Barleycorn played a leading part in the selection of the site of Asheville. A certain committee that was designated to locate the proposed town stopped one night at a wayside inn which in those days was famous for the superiority of its liquors. After due deliberation, the committee unanimously decided that the adjacent neighborhood was an ideal location. That explains why Asheville is about five miles from the spot tentatively chosen as its center.

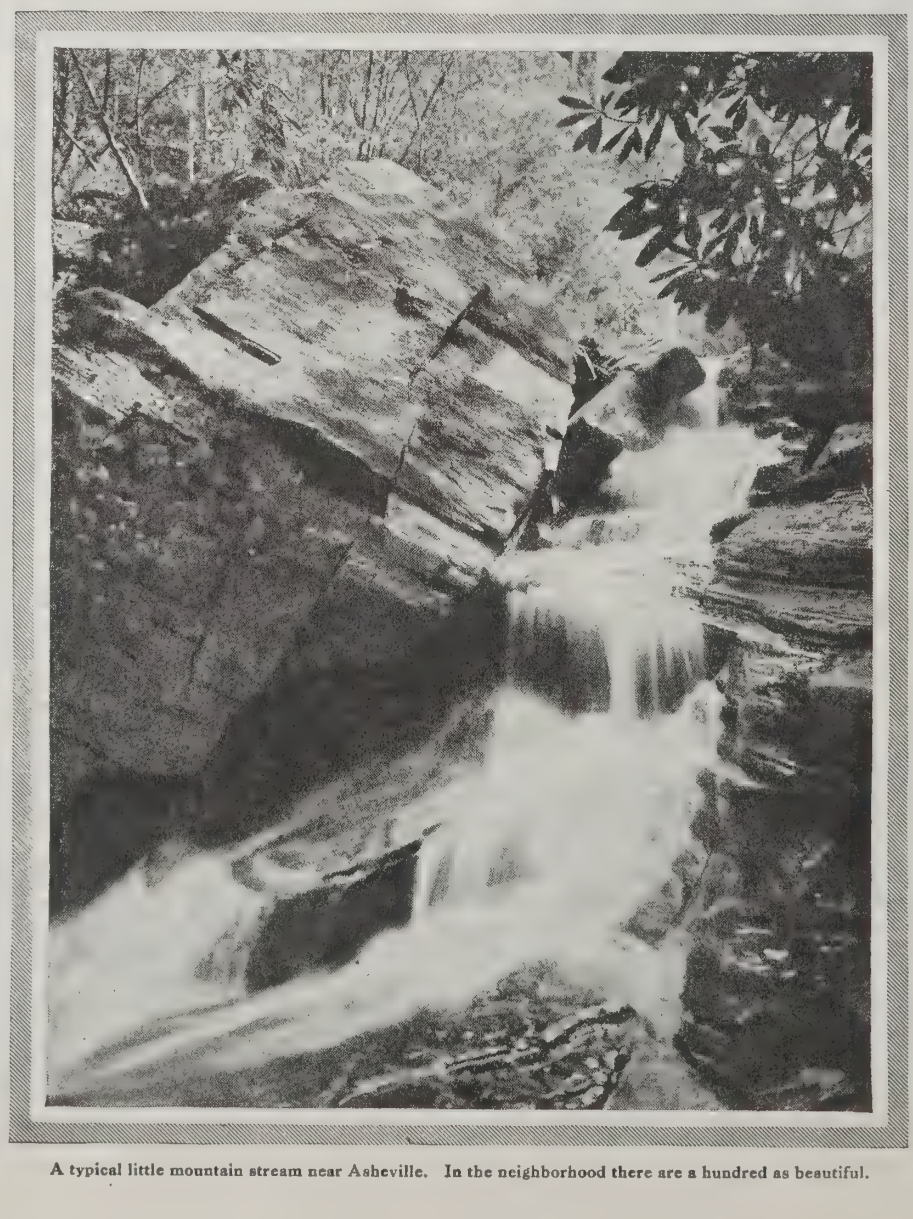
Asheville is the county seat of the historic county of Buncombe, which is situated on the Blue Ridge plateau at an average elevation of 2 500 feet above sea level. In a radius of 100 miles are 64 mountain peaks that are more than 6,000 feet high while there are in excess of 100 of these rocky crags that tower for a mile or more. Located on a high hill, Asheville is completely surrounded by mountains—on the east and south by the Blue Ridge and on the north and west by the foothills of the Unakas and Great Smoky mountains. Buncombe County was formed in 1791 and was named in honor of Colonel Edward Buncombe, a native of St. Kitts, West Indies Islands, who early in life cast his lot with the settlers of Western North Carolina. Buncombe is the center of a vast plateau of 20.000.000 acres known as "America's Beauty Spot," 60 per cent of its area being shaded by virgin timber.

The Cherokee Indians were the original inhabitants of the mountain fastness of which Asheville is today the hub. The several hills of the city at one time were the prize powwow grounds of the Cherokee, Shawnee and Catawba Indians who formerly inhabited that section of the state and settled some of their disputes by arbitration. Away back in 1794, a certain John Burton was granted two tracts of land by North Carolina which at present are occupied by Asheville's business district. Originally, the village that grew up on the Burton land was called Morristown. It was not until 1798 that Asheville was incorporated. Asheville received her first real boost a quarter-century later when a turnpike from the Saluda Gap to the Tennessee line was opened.

It is notable that the isolation of the mountain hamlets initially was productive of an era of self-sufficiency when the settlers had to grow and make their own clothes, food and articles of industry. They raised sheep for their wool and mutton, and flax for linen manufacture. They made felt and straw hats, manufactured furniture and ropes, made their own firearms, grew and ground grain and sawed lumber. It was largely through the efforts of John C. Calhoun, the famous orator and statesman, that the Asheville section was first recognized as a remarkable health resort. Mr. Calhoun always spent his summers in that neighborhood and induced many friends to do likewise. At the outbreak of the Civil War, Asheville, on account of its strategic command of the Blue Ridge, was seized by the Confederate troops. They maintained a battery on the highest hill in the town until the last year of the war when the Union forces captured the city and burned the post office and armory.

Nature made Asheville what it is today. All the promoters of progress in that remarkable municipality had to do was to capitalize on the natural advantages of their community. What is reputed to be the best gravity water supply in the world has been piped 28 miles from the mountains and stored in reservoirs. The main city reservoir has 5,000,000 gallons capacity at an elevation of 210 feet. The city also owns the watershed of 18,000 acres—a primitive forest untouched by the hands of man—covered with a virgin growth of laurel, azalea, rhododendron, balsam, oak, chestnut, poplar, gum, walnut, hickory and what not. No human being has ever lived—or ever will live—above the point where the water enters the pipe line at the intake. This insures a bountiful supply of pure, clear, sparkling water.

Altogether, it is a land of health—a veritable magnet that draws to its neighborhood invalids who are suffering from all forms of tuberculosis—physicians of nation-wide reputation report that Asheville is doing more than any other city in the entire country to control and prevent the insidious spread of tuberculosis. The city has the most rigid legislation and regulations for the production of a pure milk supply of any town in the United States. All these ordinances are rigidly enforced. The city maintains a modern abattoir where all its meat supply is slaughtered under Federal inspection. In June, 1898, Asheville passed an ordinance prohibiting expectoration on streets, in street cars or public buildings. It was the first city anywhere to enact such a law which, subsequently, has been copied everywhere. This North Carolina municipality was also the first to begin an active anti-fly crusade. This campaign was initiated in March, 1896, and was the father of all the "Swat the Fly" drives. Asheville's 50 miles of paved streets are washed with water under high pressure. No street sweeping is permitted and thus the spread of dust through the air is minimized. A modern incinerator is used to destroy all the rubbish and trash.



A typical little mountain stream near Asheville. In the neighborhood there are a hundred as beautiful.

Mount Mitchell, the top of Eastern America and the highest point east of the Rockies, is a scenic curiosity. More than a century ago before any measurements of eastern mountains were made, John C. Calhoun predicted that when the mountain climbers got busy and scaled the eastern peaks to determine the champion, that Mount Mitchell would be the lofty and towering crag to win the blue ribbon as the highest. In 1835, Dr. Elisha Mitchell, a professor of the University of North Carolina, accurately determined the exact altitude of this mountain—6,711 feet—but in descending he lost his way, fell over a cliff and was killed. The mountain was named after him and today his body rests on the summit of this notable peak.

A novel motor roadway leads to the summit. It is a one-way route. The long line of cars goes up every morning—the highway is 18 miles in length—and descends in the afternoon. The road is the former bed of the logging railroad which was installed to haul the timber that was cut from the Mount Mitchell Forest to accessible loading stations at the base of the huge peak. After the timber was freighted, the track was removed, the switchbacks were rounded off and lengthened out and the right-of-way was converted into a motor highway, thousands of carloads of cinders and gravel being used to improve the thoroughfare so that it would be passable during wet weather. The present plans are to improve this unique speedway further by the installation of a concrete path from the base to the peak of the mountain.

Practically every remote section of the great Pisgah National Forest of 86,000 acres, a few miles from Asheville, is now accessible by automobile. Uncle Sam keeps the permanent highways through this splendid forest in a fine condition. This forest is developing into a great playground. Ideal sites for campers have been set aside and more than 10,000 automobile parties visited the forest last year. The forest has been stocked with 2,500 deer, 75 elks and five buffaloes, while every mountain stream within its borders has been plentifully stocked with rainbow and mountain trout. No hunting is allowed and no person with a firearm or a dog not under leash can enter.

The forest is not fenced and consequently large numbers of wild game and overplus from the deer and elk herds wander away. Their abundance has led to the formation of several extensive hunting clubs in the Asheville neighborhood. The Great Smoky Mountain Club with its 22,000 acres of prolific hunting lands is a sportsmen's paradise. This property is 35 miles square and save for one gap, is circled by the Great Smoky Mountains. A hotel resembling a Swiss chalet is now under construction, as is a golf course.

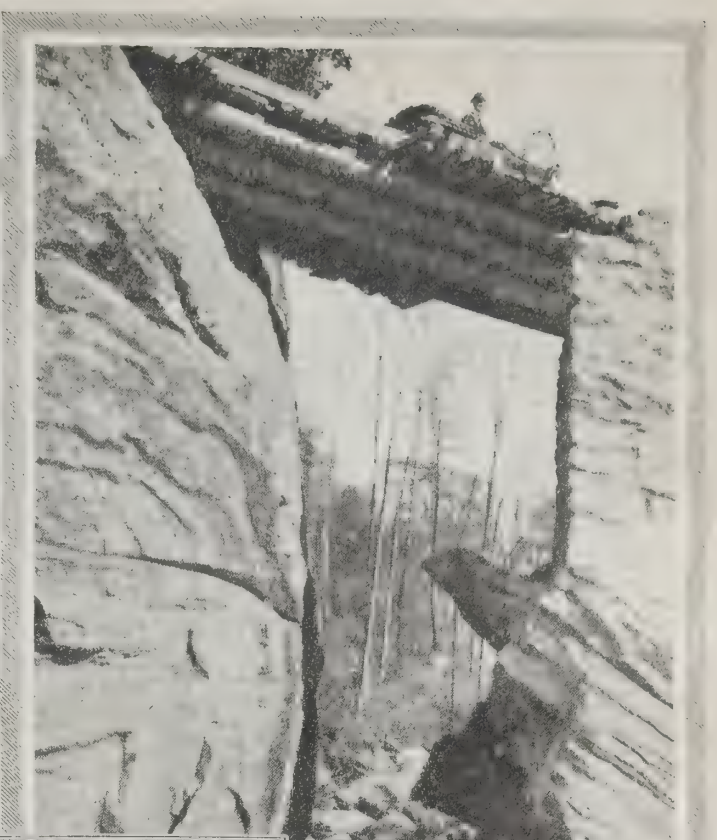
Did you ever hear of the haunted lights of Brown Mountain? For a half decade, these curious lights, which appeared above Brown Mountain, a few miles from Asheville, created consternation among those who chanced to pass that way. The "ghost lanterns" gained such fame that visitors came from hundreds of miles in all directions to stop, listen and look. Finally appeal was made to the National Government at Washington for assistance in solving the mystery. Several Federal scientists were sent to Asheville and after careful investigation they found that the lights were reflections of the automobile headlights that flitted backward and forward along the curving automobile road about 2,000 feet below the mountain. The refraction of the air currents and the waves of warm air rising from the valley after dark cause the curious lights to appear above the mountain top at 10-second intervals.

The Asheville region is the land of lost lakes. Because natural lakes are lacking, men persist in trying to build tailor-made bodies of water. These artificial lakes serve the purpose well enough until some double-barreled rainstorm and mountain freshet comes along and washes away their concrete barriers and flood fortications as easily as an infant wrecks a castle built of cards.

A strange freak which delights thousands is Blowing Rock. It consists of a shelving ledge 4,000 feet above the headwaters of the John River. You can stand on Blowing Rock as long as you wish and exert every muscle in your body in attempting to throw your hat away and despite your most strenuous efforts it will soon be blown back into your hands. This is caused by the air currents that sweep up the river valley. And not far from Blowing Rock is another natural wonder, Devil's Head. Thousands of feet above the adjoining valley and standing out like the prized masterpiece of some clever sculptor, is etched in mountain rock the strong features of Satan himself.

The queer case of the Linville River

The Asheville neighborhood now has 164 miles of paved roads and is the motoring mecca of Dixie.
At right—Tourist camp on the Swannanoa River.



High Bridge in the Asheville region is a sight worth seeing.

is a riddle never satisfactorily solved. Years ago, without any warning whatsoever, the Linville River abandoned its old course and carved a new and more rugged bed over a 12-mile stretch through and across solid rock. The new river bed drops more than 2,500 feet in the 12-mile stretch and cuts through some of the wildest and most rugged country east of the Mississippi River. The Linville and the North Fork rivers parallel for 12 miles and are never more than a mile apart yet do not converge, and both empty into the Catawba River at different points.

Looking Glass Rock is a novelty. The huge rock is shaped like a mirror. A beautiful waterfall sprays down over one side of the curious rock. When the sun is in a certain position, the onlooker can gaze at the waterfall from a considerable distance and see his picture reflected in the showering stream. Chimney Rock at a 3,500-foot elevation is yet another marvel—a severe test for ambitious mountain climbers.

In Asheville, the expansion of the business district has long been impeded by a yawning ravine, steep and precipitous, and by a miniature mountain which covers 10 acres. This small-scale mountain has been purchased by leading commercial interests and now is being razed and removed to the gully. The little mountain is Battery Hill and was the site of the Battle of Asheville during the Civil War. The first large resort hotel of the city was erected on the summit of this hill. It will be demolished and supplanted by a modern structure when the mountain has been leveled.

Australian Packs London's Famous Temple

Concluded from page 9

a day of all those early struggles and I regard my business experience as of the greatest value. Always I had had a leaning toward the ministry, but regarded it as beyond the bounds of possibility because of my poverty and lack of education. Ever since I was 17 years old, I had preached occasionally as a lay preacher in one or other of the little churches in the suburb of Adelaide in which I lived. When I was 27, by which time I had a wife and three children, I was pressed to take the regular pastorate of a little church where I had preached occasionally. I pleaded my lack of preparation; but they were good enough to insist on having me and gave me opportunity to get the education I needed while I was filling the pastorate. So I finished the regular three-year course in Adelaide University. I did not take any honors; but by studying nights and working hard I got through my examinations in good shape."

When the war broke out, Norwood tried to get to the front as a chaplain; but the best he could get was a sort of roving commission from the Y. M. C. A. to work among the troops in the training camps, doing what he could. Along in 1916, he managed to get to the front in France, still without regular commission or uniform or shoulder straps. He threw himself with his whole heart into the task of heartening the boys in soul-to-soul talks, as he found opportunity or made it; seldom preaching or conducting regular services of any sort.

The turning point in his career came very unexpectedly while he was on a brief leave in London at the end of July, 1918. With his wife, who had come from the other end of the world to be near him, he was boarding at a small hotel in Southampton Row where Dr. Joseph Fort Newton, then minister of the City Temple, also happened to be living. The American and the Australian soon discovered tastes and ideals in common and came to be good friends. About this time, a big celebration at the London Opera House was organized to mark the fourth anniversary of the war. Sherwood Eddy was to speak for America and other prominent preachers were assigned to represent Canada, New Zealand and South Africa. Almost at the last moment, Norwood was given a place to speak in behalf of Australia. On the morning of the great day, he received a program on which he found himself (in small type) put down to offer a formal resolution at the close of the meeting. And across it was written: "Time limit, 10 minutes."

This was a surprise and a disappointment. He had taken the call to speak for his loved Australian fighters very seriously. To him, it meant the voicing of deep and solemn feeling in memory of the men who had given their lives for the great cause of human liberty. He spoke to a member of the committee, asking how it had come about that he was relegated to so brief and unimportant a part in the exercises of the occasion.

"Well," said the committeeman, "we knew nothing about you and could not find anyone who could tell us anything about you, except that you had been pastor of a little church in Adelaide and that you had no official rank with the Australian forces. It seemed risky to have you at all, so we probably thought it best to play safe by just holding you down to presenting the formal resolution and giving you 10 minutes to do it in."

"At first," Dr. Norwood told me with an Irish flash in his eyes, "I had a great mind to throw the whole thing up and let them get some one else to read their stupid resolutions. I had quite a struggle with myself over it. Then I reflected that, after all, the celebration was in honor of the brave dead with whom I had lived as a pal in the trenches and behind the lines through two long years packed with tense living. So I decided to do my bit. To my surprise, the other speakers made it an occasion for the waving of flags, beating of drums and blowing of military and patriotic trumpets. To me, it was a service for the dead and I took it very solemnly and seriously. The very thought stirred me to the depths. I let myself go and spoke for 20 minutes—had to, because of the reception I received. It seemed that what I had to say proved so impressive that people regarded it as the most significant part of the program. Next morning at breakfast, Dr. Fort Newton said, 'Norwood, I wish you would preach for me at the City Temple next Sunday morning.'

"I was astonished. 'I preach at the City Temple! Why what do you mean?' I asked Fort Newton, 'What do you know about me, an utterly obscure minister of an obscure Australian parish?'

"'I know all that it is necessary to know,' he replied. 'My wife was present in the London Opera House last evening. She has told me how you poured out your heart on that platform and how your audience was moved. She has heard many preachers in her time and does not easily become enthusiastic. But she is enthusiastic about you and the greatness of your quality as an orator. So I want you to preach for me next Sunday.'

"That was the beginning of it all. Some time later, when the war was over and I was turning my eyes homeward, Dr. Fort Newton came into my room while I was packing my haversack for a little trip to Manchester. He asked me when I was going back to Australia. I told him I was booked on the first transport on which it would be possible for a civilian to sail. And, I added, a bit sadly, perhaps, that I would have to wait four months.

"'Then I wish you would supply for me at the City Temple for the next four months,' he said. 'I have just arranged for a four months' leave to visit America and my church committee will be glad to have you, if you will consent.'"

As everybody knows, there had been a great deal of pulling and hauling between Fort Newton and the City Temple people. He was not satisfied with the way they took some innovations he introduced, the fruit of his remarkably successful pastorate at Cedar Rapids, Iowa, where he had built up in less than seven years a church membership of some 3,000 and a Sunday School with more than 2,000 members. Possibly they were not ready for his American ideas and methods. After all, London is not Cedar Rapids. At any rate, Dr. Fort Newton while in America accepted a call to the pastorate of the Universalist Church of the Divine Paternity (Carnegie's old church) on Central Park West, New York, and definitely severed his connection with the London church. Norwood was promptly invited to take the vacant pastorate. He accepted and threw himself into the work of continuing the building up and expansion of the work to which his American predecessor had given so fine an impetus during the strenuous and stirring war period. Norwood's energy and ability, his tact and humanness and his very evident zest and interest in the work have already given him enduring place in the affections of his congregation and established his fame not only as a preacher, but also as an able pastor and administrator of the City Temple's constantly expanding activities.

The "Moving Man" Tells His Side of the Story

The Ideal Van Loader Is Careful Despite What You May Think of Him

By THOMAS J. MALONE

MRS. ABOUT-TO-MOVE had just telephoned in an order for a van at a certain hour of a certain day at a certain address. "I don't know her, but I like her voice and manner," said the transfer man to a caller. "She was pleasant, not distrustful nor challenging."

He sat back in his swivel chair and talked about the human element in moving household goods. Moving to the transfer man is an everyday affair, not a crisis in life, not the closing of one chapter and the opening of another, not an event full of distress from which time is measured, before and after, even until the next moving. Yet with him moving is more than simply business. His heart is in it. He is not unmindful that, unlike most other sellers of service, he deals with people mainly at times of unusual moment to them. Moving the home possessions of other folks and buying a necktie or a dinner roast for one's self are different adventures.

"We find the personal relation between customers and van workers means much," he began. "Of course, we teach the men what constitutes service and instruct them to give the best that's in them under all circumstances. Still some customers will get better service than others. It's the human touch that explains it.

Has a Friend in Gus

"IF YOU'RE hiring a man to work for you, you can treat him as a menial or as a fellow being trying to earn an honest living and likely to respond to a little show of kindly spirit and good will. Take some of our best families here; my men have reported that before they had been at work at this or that place 20 minutes the lady of the house would be calling them by their first names, just as they addressed each other. It would be "Gus" this and "Mike" that, and everything friendly and O. K. Naturally, the men would exert themselves to please.

"Gus tells how one day he was driving down Walnut avenue with a big van load and whom should he see coming his way but Mrs. Sewell, whom he had moved time and time again in the past 15 years—out to the summer home in the spring and back to town in the fall. She was with some friends in a handsome carriage—glittering harness, prancing horses, coachman and all that. The Sewells are an old family and rather cling to the old ways.

"Gus was puzzled as to what to do. He had about made up his mind to look straight ahead as they passed. But not so Mrs. Sewell. She greeted him as directly and cordially as if he had been a silk-hatted friend in frock coat and cane.

"'Good morning, Gus. Who is being moved today?'

"Would Gus go out of his way to please Mrs. Sewell, to handle her goods safely? He would, and so would all the other men on the force, for these stories get around.

"Gus says he sometimes sees Mrs. Sewell out in her front yard working among her flowers when he's going by in the van, and if she sees him he waves his cap and she waves her sunbonnet. That's human for you. The Sewells have scads of money and are way up socially, but it has never gone to their heads nor affected their hearts. As for Mrs. Sewell—well, there isn't a finer old lady in America. Ask Gus.

Where the Men Talk Shop

"THE men talk about these cases in the back room while waiting for orders, just as other folks talk about their business. It's 'shop' with them. The dispatcher—the desk man who receives orders and routes the vans—may call out an order to a man to go to a certain address for a load. Another man will speak up: 'You're welcome to that. I've been there; moved that family from the east side two years ago. You can have the job. The woman is a terror to work for. Finds fault with everything; always looking for the worst to happen, and nags all the time. They had one large much-worn easy chair with a shaky rocker, and after we had moved the goods she charged that we had knocked that rocker loose.'

"And so the new man goes out with a prejudice against that woman, which we regret but which we realize is human. Or it may be just the other way, and the man sets forth with a pleasant expectancy."

What fascinating things are disclosed in family movings—not only how the other family lives, but what it lives with, what it cherishes, what its standards of the useful and the artistic, whether it leans to oriental rugs and baby grands or to mounted buffalo horns and sea shells, gate-legged or mission tables, Windsor chairs or straight backs, mahogany or metal bedsteads! Heirlooms there are, of course—secretaries, highboys, spinning wheels, spinet desks; cribs and cradles and baby carts, not in the young household only, but often in the family of adults where sentiment clings to those dear reminders of another day. So, too, an ancient doll buggy with missing wheel and broken handle—perhaps with a doll in it, whose shining pink face and yellow hair, untouched by time, serve to perpetuate for some mature matron a joyful memory of childhood.

"Your competent van loader isn't blind to such things," the transfer man commented. "That's why he puts on the rubber-soled shoes before tackling the job and goes easy with the bulky pieces. He may wear an immobile face and speak only when spoken to, but he knows that the hearts of mother and older daughter are in their mouths as the family treasures are rounding turns in the stairway or just missing doorframes. Your ideal mover likes folks, is considerate, besides being strong and 'handy,' isn't afraid of work and has a good share of brains. We try to approach that standard in the men we send out with the vans, but once in a while, I admit, a misfit gets in among them."

He chuckled, as if at an amusing recollection. It was a favorite story and he was glad to have an auditor.

"A few years ago one of our new men, a van 'helper'—one in training under direction of an experienced man—went to his foreman and gave up his job. 'What's the trouble?' he was asked. 'We've made no kick.'

"'That's so,' returned the other, 'but you will if I keep on. I came so close to putting a foot through an oil painting today that I'm not going to take any more chances. It had been left on the floor against the wall. Buck saved me—was backing me up—said afterward he knew I was nervous and might need watching.

"'I'm quitting cold. If you have any other kind of work for a man who needs work and isn't afraid of it, work that doesn't call for canvas shoes and gloves, lead me to it.

Does What He's Told

"'YOU see I never was cut out for a mover. I'm just naturally a bungler—a foot blunderer. Why, when I was a nine-year-old kid spending the summer on my grandfather's farm, I found that out.

"'Ever see a flock of little turkeys in a storm? One afternoon grandmother was out shooing the old bird into the shed, with a high wind on and rain coming. Those young ones ran around staggering blind. "Stand still!" she said to me, "or you'll step on one." I stood still, and my bare foot came down on something soft. It was a turk.

"'They drilled a well on grandfather's place that summer. I remember how he walked over the yard with a fork of witch-hazel held out straight before him in his two hands, believing, as was widely held in those days, that the thing would turn down where there was water—the divining rod, you know. After drilling had begun, a small mirror was kept on hand to hold over the hole now and then to reflect the water.

"'Grandfather had tossed this mirror aside in the grass, when I came along, my head in the air and no thought of accident in that head.

"'Grandfather's voice rang out sharply, "Step on that now, do!"

"'Grandfather was from the old sod. I was startled, didn't know what he was talking about—and I stepped on it. No one could say I wasn't obedient.

"'It's been that way with me all my life. If there's anything around to be stepped on or kicked, I step on it or kick it. Don't mean to, you understand, but I'm hoodooed. My hands don't trouble me so, but I can't make my feet behave. Me for a job in an iron store.'

"That man was right in that he never would have made a good mover, but we put him inside and he developed into an expert dispatcher, handling the outside force from a central desk. There was nothing wrong with his head."

There is more or less grief in every business that seeks to serve the general public, according to the transfer man, but that in his business has a charm in its unexpectedness and uniqueness.

"Sometimes we boggle a job," he said, "and then, of course, try to make such amends as are possible. But we're not fond of telling about our own mistakes, and we'd rather talk about mistakes imputed to us that didn't happen. Customers complain of all kinds of things after a moving. In going over their goods at the new place, they can't find this or that. They telephone us that certain articles were 'lost' in transit—phonograph records, tableware, and so on.

"Right here, not so long ago, a professor at the state university complained after a moving that a valuable rug was not to be found. He was much excited, accused the van men of taking it, made threats and, all in all, went pretty far. All this by telephone. Yes, he had searched everywhere, had looked all through his stuff.

"His moving had been a fairly large one, using four men with the van. The office put it up to the four. One spoke up, in some disgust. 'His rug is there all right. I put it in the attic at the new place. Remember about it especially, because he was fussy over that rug when pointing it out to us, so I knew it must be something he thought a lot of.'

"The four were sent back to the professor's to find that rug. They found it—in the attic, with other goods which the professor had said might be stored there.

"Clearly the case was against the professor. He was much abashed, but rallied nobly.

"'I was wrong,' he told the men. 'I accused you all of stealing this rug, and I'm sorry. It's my nature to be hasty and I blow up too readily.'

Careful Packing Saves

"HE GAVE a $5 bill to each of the four to salve his feelings, called up the office and. in their presence, explained that the fault had been his, apologizing for what he had charged.

"The men considered the money rather easily earned, but maybe they wondered a little about the higher education."

The transfer man switched from human to material phases. At moving time, as he sees it, that wise saw about an ounce of prevention is peculiarly applicable. Careful packing continues to be the best insurance against damage to goods in handling or transferring.

With the transfer companies furnishing slip-covers—rubber, cloth or paper—to go over chairs, tables, dressers, bed ends and other standard pieces of furniture, as well as sewing machines, phonographs and the like, dishes and similar ware now present the greatest risk in family moving. For them no improvement has been advanced over the old-fashioned packing in barrels, each piece separately, between layers of excelsior and newspaper, with generous wadding.

Rightly packed, dishes will stand extremely rough handling, such as may befall in the vicissitudes of carrying, loading and hauling. Many a boy who, with no trouble at all, averages a cracked plate, a nicked glass or a broken cup handle a week at mealtimes—there are such boys, are there not?—would be amazed at seeing what trials dishes can sustain, at times, unscathed.

How often a family group, watching with foreboding the loaded van set forth, bearing virtually all its earthly goods, has had its family heart chucked into its throat as that van took a crossing with a bump that seemed to raise the rear wheels a foot off the ground! Yet on unpacking, literally in fear and trembling, at destination, more often than not not a thing has been found broken.

All the Way Down!

"I WAS moving a family into a third-floor apartment," the transfer man went on, "using the rear stairway. My helper, new to the work, was over-confident in his inexperience and a little ambitious to show off his strength. I had cautioned him against carrying bulky things unassisted, or things hard to take hold of regardless of their weight. But he was headstrong, and so tried to take a barrel of dishes up on his back.

"The weight wasn't so much, but he couldn't get a good hold. It happened—fortunately, as it proved—that the barrel was closed at the top. Oftentimes barrels are left open, you know, to insure their being stood right side up always. Well, just as he reached the head of the stairs on the third floor, that barrel slipped.

"He was too late to stop it. It rolled to the next landing, crashed into the wall, rebounded, made the turn perfectly and kept on down to the second floor. It may seem implausible, but that barrel didn't stop there. It knew the law of angles in meeting a plane surface, for it hit the wall again, came back in line with the flight to the first floor, bounced merrily on to the landing, banged into the wall again and—I don't expect to be believed—but it's true—coasted on, not to the main floor only, but clear to the basement. It had to stop there. It stayed together, too.

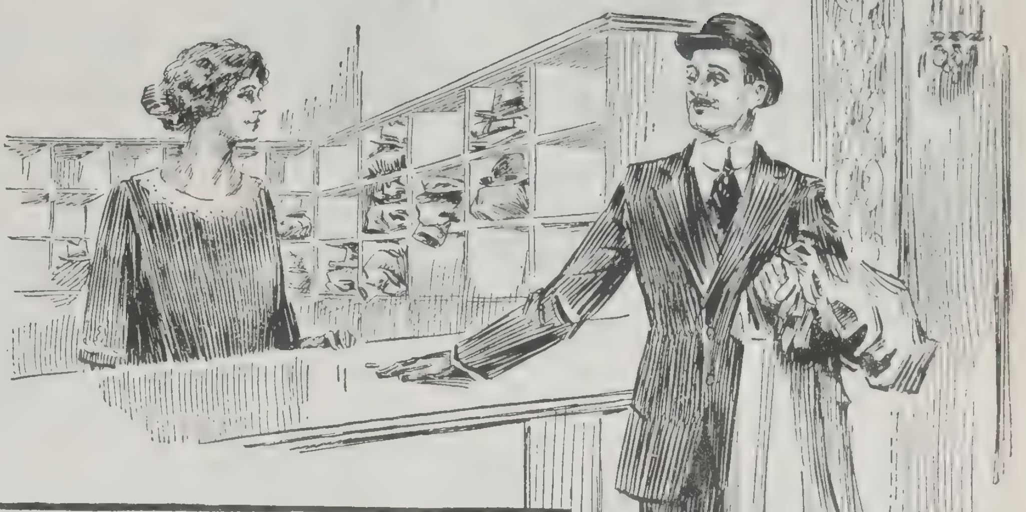
"From the noise, you wouldn't have thought there was a sound piece left in that barrel. Yet, when it was opened, not one piece was found even cracked.

"That suggests what good packing will do."

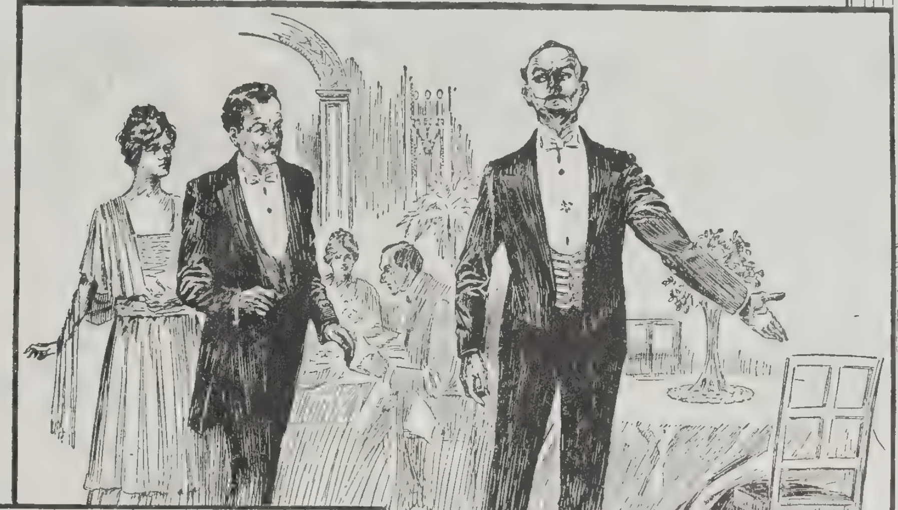
Tip or No Tip—That's the Question

How Has System of Double-pay—to Proprietor and to Employe—Come to Be Entrenched So Well Asks This Victim of the System

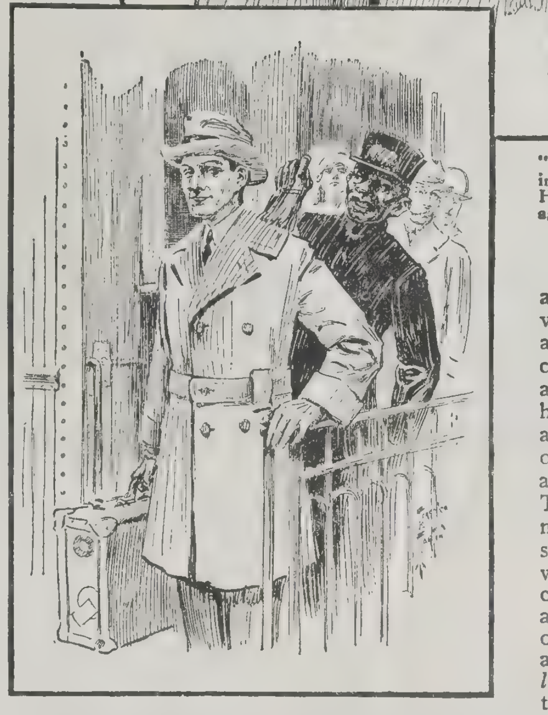
By GEORGE HENRY HEALD, M. D.



The man who in the goodness of his heart gives a liberal tip to the pretty girl in the hat room does not realize that the girl gets none of that tip.



"Entering the dining room, we encountered a gentleman in evening suit, who condescended to direct us to a table. His bearing indicated that he was an important personage, probably Count Somebody, direct descendant of Charles the Precise."



"All who travel know the tricks of the Pullman porter, and his various devices for collecting from the traveler the wage that should be paid him by the sleeping-car company."

WE WERE doing Europe, wife and I, handicapped by an acute and painful discrepancy between the urgency of our desire to see everything of note, and the size of our pocketbook. After considering our available time and funds, we allotted four whole days to Paris. We had learned of a fairly good and moderately priced hotel located near the center of the city, and on a small map had studied the lay of the streets between the station and the hotel.

With the aid of our high school French and an occasional police officer, we found our way with little trouble over the mile or more maze of streets to our hotel. It was a queer little hotel, about a story and a half in width and six in height, in which the outstanding features were an automatic elevator of the you-push-the-button-and-we'll-do-the-rest type, and a well-lighted dining room opening off a palm garden. No tips in the elevator, but in the dining room—that's another story.

Entering the dining room, we were met by a gentleman in an evening suit, who condescended to direct us to a table. His bearing indicated that he must be some important personage, probably a Count Somebody, a direct descendant of Charles the Precise. Perhaps it was because I was somewhat abashed and ill at ease in his presence that I so lost my nerve as to spill soup on the spotless damask. Naturally, the mishap did not lessen my embarrassment. Glancing furtively toward the autocrat of the dining room, I was reassured. He had not seen the accident. I was not long in covering the spot with a silver franc. This relieved the tension, but the accident had mellowed the keenness of our appetite, and we soon escaped to the kindly shelter of our room.

Having developed something of an aversion for the dining room, we considered the idea of having trays sent to the room, but this seemed cowardly; and as the tray service would add to the expense, we overcame our feelings and went down, with such courage as we could muster, for breakfast.

What was our surprise, on entering the dining room, to be met in the most gracious manner by our august friend of the evening before, who bowed us in with every show of respect, and conducted us to the best table in the room, the one next to the palm garden. And this table we occupied exclusively as long as we remained at the hotel. Evidently there was strong persuasive power in that 20 cents. Another guest, an elderly lady, who asked for a seat near the palm garden, was refused. We felt sorry for her. Evidently she did not know that a dime or two judiciously placed would accomplish wonders. During the remainder of our stay, this waiter, so pompous at first, showed us every attention. In fact, his efforts to please us were so conspicuous as to be embarrassing.

Now I could not help feeling that—commercially speaking—that tip (for so the waiter had considered it) was a good investment. For 20 cents we received many times 20 cents' worth of service. But I felt guilty. Though I had placed that coin, *not as a tip*, but as payment, or penalty, for the soiled linen, I was oppressed by the conviction that it was accepted as a tip, and that tipping to receive special favors is graft and morally indefensible. Was I wrong in this?

The conviction grew upon me that a gift given to an employe inducing him to do something for me beyond his duty was an injustice to the employer or to the other guests. I recalled an instance related to me by a physician who had purchased a second-class ticket to Africa. Finding the food and service not quite to his liking, he explained matters to the purser, mixing a generous proportion of silver with his argument, and as a result received practically first-class fare. The amount paid the purser may have been one-fifth the amount he saved on his second-class ticket. The transaction benefited two persons. The purser pocketed some money, and the passenger saved some money. But it was at the expense of the company. I could not get away from the idea that when one person tips another for a special service, *somebody loses*. It was quite evident that the waiter who was so profuse in his service to us was neglecting others, who notwithstanding the neglect would be expected, when they left, to remember him with a tip. The thought was growing on me that the waiter who accepts tips cannot render impartial service. And they do not want to render impartial service, as I learned later from a book written by a waiter.

This booklet, bearing the title, "Do You Tip the Waiter, or Are You a Stiff?" was written, so it states, by a waiter of 22 years' experience. It gives admirably the point of view that has been bred into servants by the tipping system. After stating that "'The stiff' who does not tip the waiter gets bum service in return," the author proceeds to describe the neglect, the insults, and other things done or left undone to make the non-tipping patron uncomfortable, and ends the chapter with the words, "There is no alternative, if you want clean attention, and prompt service, you must tip the waiter." Then, in another chapter, he informs his readers that the man who neglects to tip is served inferior food, in an uncleanly, slovenly way, and is given a dirty finger bowl, and water in an unwashed glass. The chapter ends, "If you don't want to pay for service, then wait on yourself." In another chapter, entitled "THE WAITER IS MASTER," is given this delightful information: "Don't you know that when you sit down to dine, you are the servants and the waiter is the master?" Such is the spirit that the tipping system has developed. Those who accept tips are haughty toward those who have conscientious scruples against tipping, but are obsequiously fawning toward those who are liberal with tips.

How has this system of double pay—pay to the proprietor for service, and a second pay to the employe to insure that you get the service that you paid the employer for—how has it obtained such a hold on the country? What is behind it? Who are the beneficiaries?

One can well imagine that the custom of tipping began with some snob (I can find no better word to express my meaning) who felt that he ought to have a little better service than other patrons. If the house used a gallon of milk, he expected the cream, and the other patrons could have the skim milk that was left. So he quietly slipped a coin to the waiter, saying, "I am a live one, and I want the best that you have." He got it, and thereby learned that a small investment made with the waiter was worth more than the same amount invested with the owner. He was getting the best of service at a comparatively small outlay, and getting it at the expense of the owner and the other patrons. The waiter was not slow to perceive that here was a new way to enlarge his earnings, and he began to shower attentions upon the tipper. Other patrons were not long in learning what they must do to get preferred service, and so the tipping spread. Waiters began to work the new idea for all that it was worth, and patrons generally accepted the practice of tipping as the lesser of two evils. Next the owner saw a good thing in it. Waiters were making as much from tips as from their wages, so he began lowering wages, little by little, until in some places waiters actually paid for the privilege of serving. The concession enabled them to make much more than they could by the wage system.

The waiter and the bell boy and other employes were now making such a good thing out of tips that it attracted the attention of the "man higher up," who believed that the tipping business could be profitably capitalized. So tipping trusts were organized.

When the evolution of the tipping system reached the point that all the profit went to a corporation, labor rose against it. But nothing has been accomplished.

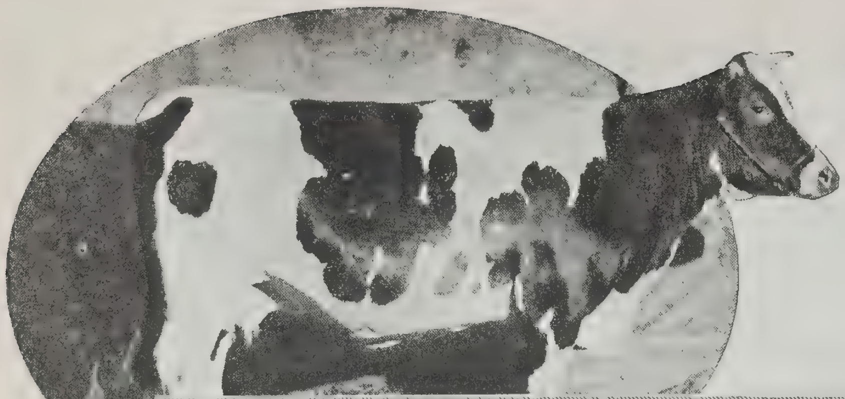
There are hotels and restaurants which discourage tipping. One hotel, at least, has run successfully, paying a good wage, and forbidding all tipping. A number of hotels pay good wages, and discourage tipping.

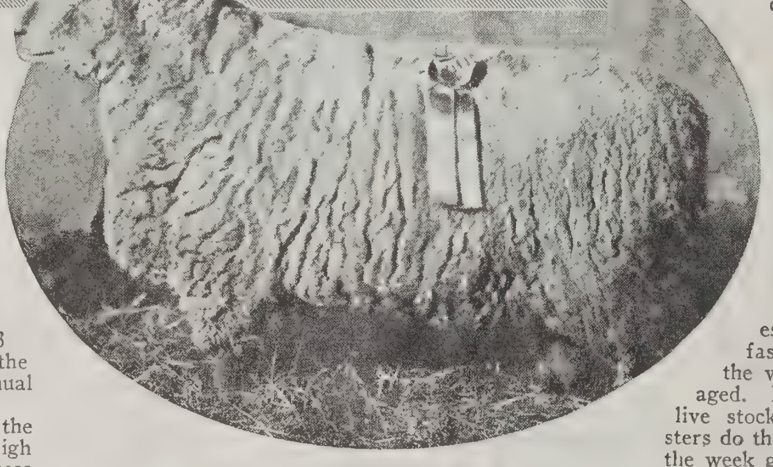
All who travel know the tricks of the Pullman porter, and his various devices for collecting from the traveler the wage that should be paid him by the sleeping-car company. An amusing thing occurred in connection with the sleeping-car service when the government required all common carriers engaged in interstate commerce to pay their help a living wage. The sleeping-car company had to increase its pay roll by hundreds of thousands of dollars. At once it informed the public that tipping would no longer be permitted.

Nearly everyone tips, but there are classes of tippers. First, there are those who want to establish and emphasize class distinctions, who believe in aristocracy rather than democracy, who would like to see the caste system established in this country, a ruling class and a servile class. In maintaining the tipping system, they are working in the direction of their ambition. Second, are those who believe that judicious tipping is a profitable investment. If a quarter paid to the waiter will procure better food and better service than an equal amount paid to the house, they are that much to the good. Third, are those who have great respect for the established conventions and customs, and who, though they do not like tipping, fear that they might lose caste socially if they do not tip. They follow tipping just as they follow any other style. Fourth, are those who despise the tipping system, and who tip when they have to in self-defense, to avoid indignities. Fifth, perhaps, are those who tip out of pity, especially when the tippee is a pretty girl, under the mistaken notion that the girl benefits by the tip

Co-operative Effort Wins for Minnesota Farmers

Winter Agricultural Shows, First Attempted 13 Years Ago by Farmers of Red River Valley, Prove So Attractive and Beneficial Attention of Entire State Follows





Red River Valley Live Stock Association sales pavilion built in 1918 and owned by the association members in which the Red River Valley winter shows are held.

Above and below — Prize winners.

THIS is the story of one phase of the work of one of the Minnesota agricultural schools. It is the story of achievement and co-operative effort.

The farmers of the Red River Valley, in Northwestern Minnesota, in co-operation with the Northwest School of Agriculture at Crookston, have sponsored an undertaking which bids fair to have a far-reaching influence. They have built up the Red River Valley winter agricultural shows and meetings to such proportions within 13 years since the enterprise was first conceived, that the managers of the project have won a special annual grant from the state legislature.

Chambers of commerce 300 miles distant from the Red River Valley have seen fit to appropriate as high as $4,500 for the support of this enterprise. Business men and farmers in a territory covering a fourth of the state have jointly subscribed stock for the construction of buildings in which to hold meetings and exhibits. Four to five thousand farmers leave their homes in the dead of winter to attend these meetings for several days and in addition bring more than 1,000 head of purebred stock to place in the competitive exhibits.

The event referred to is the Northwest School Farmers' Week and Winter Shows. The entire enterprise is the result of co-operation.

To appreciate properly the significance of these meetings it is necessary to read the history of the organization. The University of Minnesota has, in addition to its College of Agriculture at St. Paul, three state agricultural schools. One of these is the Northwest School of Agriculture at Crookston, established there to study the agricultural and community problems of that section.

In considering means to render the most effective and far-reaching service to its constituents, C. G. Selvig, who assumed the superintendency of the school in 1910, initiated the first farmers' short course in December of that year. It was a small beginning, it is true, but a number of enthusiastic farmers were present for one week. They brought with them samples of grain which were placed on exhibit in the small gymnasium of the school. This was the first Red River Valley winter show.

The week was a success from the start. It was decided at once to make this an annual event. In just three years the attendance exceeded the accommodations of the school and special buildings in Crookston were provided. Live stock and poultry exhibits were added. The meetings grew in scope, purpose and attendance. By 1918 they had assumed a position of importance in the state.

Today the Red River Valley Live Stock Association owns property to the value of $75,000, stock having been sold to pay for it at $10 a share to more than 2,000 persons.

The single aim of the winter meetings is to encourage a better rural life. The rural schools of 11 counties are enrolled in an essay and a spelling contest. The annual old-fashioned spell-down is one of the features of the week. Boys' and girls' club work is encouraged. Liberal prizes are given for the winners in live stock, grain and potato exhibits. The youngsters do the actual showing and at various times during the week give demonstrations of their projects. Farmers' clubs are encouraged to compete in a live-stock judging contest and an entire day is devoted to this feature of the work. Prominent live-stock judges are present who explain their placings at special meetings held for that purpose. The entire week is a huge school at which thousands annually are in attendance.

The exhibits include chiefly purebred cattle, swine, sheep and poultry, and high quality exhibits of grain, grasses, corn and potatoes. During the recent meetings the Minnesota State Grain Show was held in conjunction with the Red River Valley shows. The exchange of ideas at these shows has been a potent factor in raising of better products. Northwestern Minnesota is rapidly becoming a center for purebred live stock and purebred seed distribution.

Through the sale of purebred stock each year the live stock breeders have found a local market and have kept certain breeding strains within a definite territory, thereby furthering the interests of all.

By no means are the women left out of consideration. Special meetings are held for them, at which time questions of dress, children's diet, nutrition and community service are discussed. Special agents from the University and Extension Division co-operate with the local instructors to make these meetings worth while.

Another feature of the organization has been the encouragement of community singing throughout the district. No feature is more popular than this one. Local musical organizations have been promoted in the small towns and rural communities, each one under a local director. These units number from four to twenty individuals. One evening during the winter shows week is devoted to a grand song festival. Each unit presents a number of selections in addition to taking part in the combined chorus, consisting of 150 to 200 singers from as many as 12 to 20 communities.

The Northwest School Farmers' Week is entirely educational. Speakers of known ability contribute to the success of the meetings. Experts whose conclusions carry weight and confidence in their ideas bring new ideas to the Red River Valley which are carried back to the rural communities. The Northwest School has created a spirit that has touched all, resulting in making new standards of production, in creating new ideas of co-operation, and in teaching that a community life in which all work together, all live happily together, all sing together, all achieve together, is most worth while.

Faneuil Hall, Our "Cradle of Liberty"

Concluded from page 3

portraits of 130 Senators and men of distinction, and it took the artist seven years to complete it. The portrait of Peter Faneuil is a copy of one by Smibert who was a friend of the "Jolly Bachelor" and the architect of the building. There is also a portrait of Washington by Stuart and one of Hancock and of Warren by Copley.

But the grasshopper weather vane is a relic from old colonial days. Shem Drowne, the "cunning artificer" and hero of Hawthorne's story, "Drowne's Wooden Image," hammered it out of sheet brass in 1742. It escaped the fire of 1761 but was later thrown down by the same earthquake that destroyed Lisbon. At one time, when it was being repaired, a paper, half illegible, was found within it, telling that "Shem Drowne made itt May 25, 1742," and that it was repaired by "old Master's son Thomas Drowne, June 28, 1768," and that it "fell in ye year 1753, November 18, early in ye morning," together with other details of its varying career. The brass ball that was a part of the vane is now in the museum of the Ancient and Honorable Artillery Company who have their headquarters in the upper story of Faneuil Hall.

This company is as vigorous a survivor of the past as the Hall itself and has a longer history. It is the oldest military organization in the country and an offshoot of the oldest in Europe, the Honorable Artillery Company of London which, in 1537, received a charter from Henry VIII.

Just a hundred years from that date Robert Keayne, a member of the London Company, with six associates, asked Governor Winthrop for a charter. At first they were refused on the ground that it might be "dangerous to erect a standing authority of military men," but the following year the objections were overcome and a charter granted. Captain Keayne called his band the "Artillery Company" but the title pages of early sermons delivered before it bear the title "Honorable Artillery Company," and at the close of its first century the word Ancient was added. Robert Keayne built the first headquarters of the company on the site of the Old State House, but in 1746 the Company removed to Faneuil Hall where it has since remained.

Many customs of the Company are followed as in colonial days. Its annual election occurs invariably the first Monday in June with practically the same ceremonies as in 1638. Early in the morning the adjutant and drum corps sound reveille at the home of the officers, at ten the Company escorts the governor and his staff to church, then, after service, proceeds to the Common where the drum-head election takes place.

One can fancy that that is the Common's gala day for the year. The Hancock elm and the Gingko from the garden of Harri-Grey Otis and the sapling from the roots of the great elm that stood before the white man came must rejoice together with memories of an older time when the scarlet and buff and gold lace passed daily up and down the shaded malls.

Opening into Faneuil Hall Square at the south is Corn Court, once the corn market of the town. As the site of Faneuil Hall was ideal for a market and dock, so the neighborhood was the logical place for a tavern. In 1634 Samuel Cole, a charter member of the Ancient and Honorables, had a public house there in which Governor Vane entertained the Sachem of the Narragansetts and 20 of his braves.

When John Hancock was elected first governor of Massachusetts the tavern by the corn market was renamed in his honor and a sign bearing his portrait swung from the middle of the court. In 1790 Talleyrand lived there, an exile from France, and two years later Louis Philippe was a guest under the name of M. Orléans. When he came to the throne he often spoke of the cheer and good company in Boston. Twenty years ago this landmark was swept away by business, and only its faded sign is preserved as a memento of its glory.

But Boston has learned somewhat to cherish her memorials of the past and for none is she more grateful than for Faneuil Hall. In 1742, replying to the town's vote of thanks, Peter Faneuil said, "I hope that what I have done will be for the service of the whole country," and his words were truly prophetic. Like the Common, Faneuil Hall can never be sold nor rented for money, so it may well remain, in the centuries to come as it has been in those past, an unfailing refuge for freedom.

The People—Their Own Insurance Company

Wisconsin Only Commonwealth With State-owned Life Fund

By FRED L. HOLMES

Above, left—HERMAN L. EKERN, former Wisconsin insurance commissioner and now attorney-general, who originated the plan for State Life Insurance. Above, right—C. A. INGRAM, Wisconsin Legislator, who holds the first State Life Insurance policy. Below—State Capitol of Wisconsin, where the only State Life Insurance plan in the Union is operated.

WISCONSIN is the only commonwealth with a state-owned and state-managed life insurance company. It was in operation several years before the World War, and unlike the War Risk insurance furnished by the National Government only to soldiers, the policies of the Wisconsin Life Fund are offered to all citizens of the state.

The Wisconsin insurance plan had its inception in 1911. There had been insurance scandals in the East. The Armstrong investigation in New York, followed by a similar investigation by a legislative committee in Wisconsin, gave the idea.

Herman L. Ekern, then a young country lawyer, had been elected to the legislature. He became deeply interested in problems of insurance. He studied some of the laws of foreign countries and came to the conclusion that Wisconsin should have a state insurance plan of its own. Meantime he had been elected commissioner of insurance in Wisconsin. One day he called a group of the legislators together and they talked over the plan. Out of this conference came the state life insurance plan.

The idea of the control of affairs by the bankers of the East was in the air. Men like Senator La Follette and William J. Bryan, whom most of the members of the legislature had met and to whom their ideas appealed, had been making speeches against the money trust, charging that "things were being cornered." That seemed to settle it. These legislators believed too much money was being sent to Wall Street for speculative purposes. If the state had a life fund, the people could get sound insurance and the reserve would be invested in Wisconsin farm mortgages for the greater development of the state. The bill went through and became a law with the acquiescence of the insurance companies.

Two years were given the commissioner of insurance to prepare forms, tables and other necessary data to carry the act into effect. On October 27, 1913, the first 200 policies were issued. There were 27 women applying for insurance in the first group of applicants. C. A. Ingram, of Durand, farmer, lawyer and legislator, was granted the first state life policy.

The fund has now been in operation nearly 10 years. It has not been a big success, like some of the insurance companies which have been pushed by private capital. It has had, however, a wholesome influence in the affairs of the state and has stood as a barometer for the people to judge as to what private companies should charge for their insurance. There has never been open opposition from the private insurance companies and many of the officials of the private concerns have viewed it as a potential advantage, because of the fact that the state has recognized the insurance business as a legitimate field and a necessary one in the affairs of life.

There are now 505 policies issued by the State Life Fund of Wisconsin. The amount of insurance in force is $429,900. It maintains a standard reserve and has one of the lowest mortality experiences, 23.7, enjoyed by any insurance company in the country. Its assets are all invested in mortgage loans, bonds on Wisconsin real estate and loans to policyholders.

These Wisconsin life fund policyholders get their insurance at cost. The law authorizing the fund utilizes all of the existing governmental agencies. No high salaried positions are created. The law is administered by the commissioner of insurance, with his force of clerical and actuarial assistants. The state treasurer, as ex officio custodian of the funds, makes the investments. The attorney-general of the state is the legal advisor. The state board of health acts as a medical staff, and appoints local examiners to pass upon the insurability of the applicants. The fund pays to the state the proportionate share of its clerical expense and the cost of making its investments. It has no agents. Clerks and treasurers of cities, towns and villages; officials of banks which receive state deposits and state factory inspectors are authorized to receive applications. Thus the fund saves the policyholder the large solicitation or acquisition expenses and also makes considerable saving in overhead charges.

The insurance can also be had on personal application or on application by mail. The applicant is required to take a medical examination. Upon approval, policies signed by the commissioner of insurance and the state treasurer are issued. Thus the state stands back of the venture. If, after medical examination, the applicant is rejected for any cause, the premium deposit, except the medical examination fee of $2, is returned.

Forms of policies issued by the American life insurance companies are issued by the Life Fund, including ordinary life, 20-payment life, 20-year endowment, 10-year endowment, endowment at age 65 and term to age 65.

By the provisions of the law insurance is granted in sums of $100 or any multiple thereof not exceeding $1,000 until the number insured exceeds 1,000; and not exceeding $2,000 until the number insured exceeds 3,000, and not in any event exceeding $3,000.

A table of mortality designated by the statute is the basis upon which the insurance is computed. The first thing sought is absolute safety. A mathematical reserve is provided on the basis used by the largest and soundest insurance companies and the assumption adopted for mortality and interest is as high as any used by any standard company in this country. In most cases the premium paid for life insurance is lower than that of old line companies. This is possible because of the elimination of the large solicitation expense and overhead charges.

"The purpose of the State Life Fund is to give the people of Wisconsin the benefit of the best old line insurance on a mutual plan at the lowest possible cost," declared Attorney-General Ekern, the real father of the law, in a recent statement. "To benefit the policyholders is the sole consideration. Of the total expenses of old line companies nearly one-half goes to agents in commissions and salaries. Under the state plan policyholders are saved this great expense. Besides, there are gains from interest earnings and mortality savings."

Every advantage enjoyed by policyholders in other companies seems to have been granted. Policyholders may borrow on their policies to an amount, which, with interest, does not exceed the reserve. On the non-payment of a premium, the sum is automatically charged as a loan so long as the reserve is sufficient. The policy may be surrendered for cash on any anniversary, after six months' notice in writing. Losses are passed upon by the state treasurer, attorney-general and commissioner of insurance. All claims are audited by the secretary of the state.

Payments for insurance may be made quarterly, semi-annually or annually. At the close of every year, the savings are returned to policyholders in the form of dividends. To create a fund to meet unexpected contingencies, there is withheld from distribution 50 per cent of the savings during the first policy year. Each subsequent year, the per cent to be withheld is reduced five per cent until the ninth year and thereafter 10 per cent is withheld. This builds up a satisfactory surplus, but still permits a dividend larger than most of the large private companies.

To carry out every feature of this law and to administer the fund at the minimum of expense all of the existing agencies for supervision have been called into service. Most of these officials are serving on a salary fixed by the constitution and receive no additional compensation for the work done in connection with the State Life Fund.

Although the State Life Fund did not come into complete operation until 1913, a number of the first policies were issued in 1912 and with 10 years of experience, officials announce that the savings effected are greater than were originally anticipated. Recently a 10-year endowment policy issued in 1912 came due. It matured from $1,017.48. The 10 annual payments less dividends and remittance fees have amounted to $864.06. The insured has had $1,000 of insurance in force for 10 years and received in return $153.42 more than he paid in.

Similar results are shown on 20-year endowment policies. A 20-year endowment policy issued in 1912, age 25 years, has a cash value of $407.79. The premiums for the 10 years have been $435.65 from which the insured has deducted or has been refunded $83.20 making the total net payments $352.45. The insured has thus had an insurance protection for 10 years and has a value which he may now withdraw in cash of $407.79, against a net cost to him of $352.45. Here is a net gain of $55.34 with his 10 years of insurance still in force.

If the state were to permit of active solicitation of policies, it is probable that the State Life Fund would grow faster. Persons sending in applications for others are only allowed a 25-cent fee plus one per cent of the remittance. This has not been a sufficient inducement for individuals to become active in the interests of state insurance.

Many policies issued have come as the result of little circulars which have been sent from time to time to state employes. Attractive little tables of rates have been issued, but no comparisons are made in the literature of rates charged by competing private companies. While such a comparison would ordinarily be to the advantage of the State Life Fund, such a policy has been checked on the ground that the fund was not established as an active competitive force, but rather to furnish Wisconsin citizens who desire it, insurance by the state itself.

Recently there has been a revived interest in state life insurance. Here are samples of two different classes of letters received:

"Kenosha, Wisconsin.
"State Insurance Commissioner,
"Madison, Wisconsin.
"Dear Sir:

"What does your department charge for insuring the life of a man 39 years old?

"The old line rates are so high and policies are so full of conditions and limitations, provisions, and so on, that it makes a policyholder feel as though he had bought a gold brick, when he has one handed to him.

"Would it be possible for me to get one of the forms on which the state policies are written up, so that I could read it over and see if it would suit me?

"Yours very truly,
"W. H. P.————."

"Augusta, Wisconsin.
"Dear Sir:

"Please send a sample policy and rates for the state insurance. We have a number that want to look it up and say they think they will take a policy in it.

"Yours truly,
"C. E. B.————."

Moreover, many manufacturers are interested. Some are putting the plan before their employes by inclosing the state circulars in state envelopes; by pasting placards in the shops and even by advancing their employes money to make the first payment. The progressive employer forms an important link in the system.

The first 200 policyholders represent 28 different occupations.

"The state is directly interested in the question of whether its citizens make provisions for their dependents and for themselves in old age," declares Mr. Ekern. "With the growth of an industrial population, which of necessity can own but little producing land or other productive capital subject to its own direction, the question of a certain and fairly adequate provision for dependents and old age becomes of increasing importance.

"This goes far beyond the mere question of dollars and cents expended in poor relief. The saving of self-respect of the unfortunate, the securing of the contentment and happiness which spring from the assurance of support in old age or in adversity, and the opportunities in life so afforded dependent children are considerations which can in no instance be measured in money. The state exists to contribute to the happiness and well being of its citizens. These objects can be furthered by sound insurance and annuities. Thrift and savings are desirable and to these ends doubly desirable. To encourage these virtues for these purposes with the greatest economic saving through the State Life Fund is the plain duty of the state."

BRIEFLY TOLD

The violin once belonging to Paganini, the father of violin technique, is kept in the Palazzo del Municipio in Genoa. The violin is a product of the master craft of Joseph Guaranerius del Jesu. With three broken strings, it lies in a silk-lined box, in a large room, where the sunlight seldom enters.

There are only 193,881 veterans of the Civil War on the pension roll.

A Marion, Ohio, man returning from a visit to the President states that the President doesn't have time to read the newspapers, he is so busy. The President confessed to the caller, according to his report, that he takes the Marion *Star* to his room at night and looks it all over from top to bottom and from the first page to the last. Then he takes a rule and measures up the advertising.

Pulling trains day after day is very hard on locomotives. More than a fourth of the locomotives in the freight service are either in the "engine hospital" or awaiting their turn to go there.

Premier Mussolini, of Italy, plans to excavate and restore the Curia, or Senate House, of ancient Rome, which was burned in 53 B. C. The church of Saint Adriano stands on the spot. A few years ago archeologists discovered a part of the original beautiful tesselated pavement, but Spanish monks in control of the church refused to allow further excavations.

The students in the Berlin "Students' Home" are so poor that three have to share one suit of clothes and attend the classes each in turn.

Retrieving his tobacco in excellent condition after it had been cached for 10 years is the experience of a Canadian trapper who makes the wilds of Northern Manitoba his hunting ground. In 1913 he made a cache at Copper Lake, which is 72 miles north of The Pas. In this cache he placed three pounds of tobacco in six half-pound tins. Returning to Copper Lake early in the present year he found that the cached tobacco was as good as ever, although it had been there about 10 years.

In Larderello, a little town in the Italian province of Pisa, is an electric station which produces electricity from the thermic energy procured by the natural steam under the ground. This station furnishes light and power to the surrounding country.

In the Miles Standish School in Cleveland history is taught by depicting various historical events on the school stage. When a child actually acts a part in the drama of history, immediately that lesson is firmly fixed in the mind and the student will remember it always, according to the teacher.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

A bottle consigned to the sea off the coast of Japan by the navy department of the Japanese Government April 13, 1921, was found on the shore at Tillamook, Oregon, not long ago. It is 4,700 miles from Oregon to Japan in a direct line.

The adulteration of Bulgaria's famous attar of roses perfume has developed to the point where the Bulgarian Government has intervened. Essence of geraniums is being used in debasing the perfume. A bill has been introduced in parliament appropriating 1,000,000 levas in prizes to scientists who discover a process for the certain detection of the presence of adulterations in attar of roses. In normal times the leva is worth 19.3 cents.

No fewer than 46,000 families are in Vienna, without a place to live. They cannot rent even one room, because since 1913 not one house has been built in Vienna, which is now the poorest city in the world. In some cases four or five families live in one small room.

A radio outlaw within a radius of 200 miles of Paris persists in interrupting the broadcasting of concerts from Eiffel Tower. He broadcasts jazz music and insolent or frivolous messages and is evidently a practical joker. His transmission is a powerful one and he commands as great a wave length as the Eiffel Tower.

During the calendar year 1922, there were 84 earthquakes strong enough to be felt by the unaided senses, in various parts of continental United States. These earthquakes occurred chiefly in California and in a section of the Central States.

While her husband was searching for ammunition for his rifle, the wife of the postmaster at Granite Falls, Oregon, rushed downstairs and opened fire on three bandits with her revolver. The bandits had used one charge of explosives in an attempt to open the post office safe containing a large amount of money. Before they could place the second charge the husband appeared on the scene with his empty rifle and they were frightened off after firing eight shots at the defenders.

A former director of the Boston Symphony Orchestra, a teacher and master of almost every musical instrument, died in the poorhouse in Fresno, California. At one time his own orchestra was heard with delight by thousands at the Panama Pacific Exposition in San Francisco. He was a musician of the old school. Jazz did not appeal to him and his pupils dwindled until there were none.

There is no traffic in the streets of Seville, Spain, during Holy Week. All the inhabitants are imbued with a deep spirit of reverence which permits of no secular activity on these solemn days.

A smelt-like fish called eulachon by the Siwash Indians, of Alaska, when dried, can be used for a candle. The fish is very oily and the Indians render the oil from the body of the fish by means of heated rocks. This oil is used for cooking during the long winters.

A Washington, D. C., policeman took exception to the tin pan din and excessive horn blowing of a wedding party and escorted the principals to the police station. The police commissioner ordered their release saying it was just foolishness to arrest them. "Most people only get married once and they ought to be free to celebrate it. They can blow 40 horns if they want to," he said.

Life lines are now illuminated by radium. This aids the coastguards in tracing the line when shooting it toward the stranded ship.

The Department of the Interior has approved the issuance of a pension certificate to Shuh-Shee-Ahsh, alias Curly, a Crow Indian, for his services in the Indian campaigns of 1876 and 1877, which included participation in the Custer Massacre. Curly now lives on the Crow Reservation in Montana. According to War Department records he escaped death by mingling with the attacking Indians and later rejoining the government forces.

PROPAGANDA OR FACTS?

The world today is flooded with propaganda. There is a scarcity of facts. Pick up a magazine or newspaper and glance through it. Aside from local news—how much dependable information do you find?

That is why Henry Ford established

The Dearborn Independent—The Ford International Weekly

A non-partisan, non-sectarian weekly magazine, devoted to printing facts—a chronicler of the neglected truth.

Any Ford Dealer will gladly accept subscriptions or they may be sent direct, using the blank below.

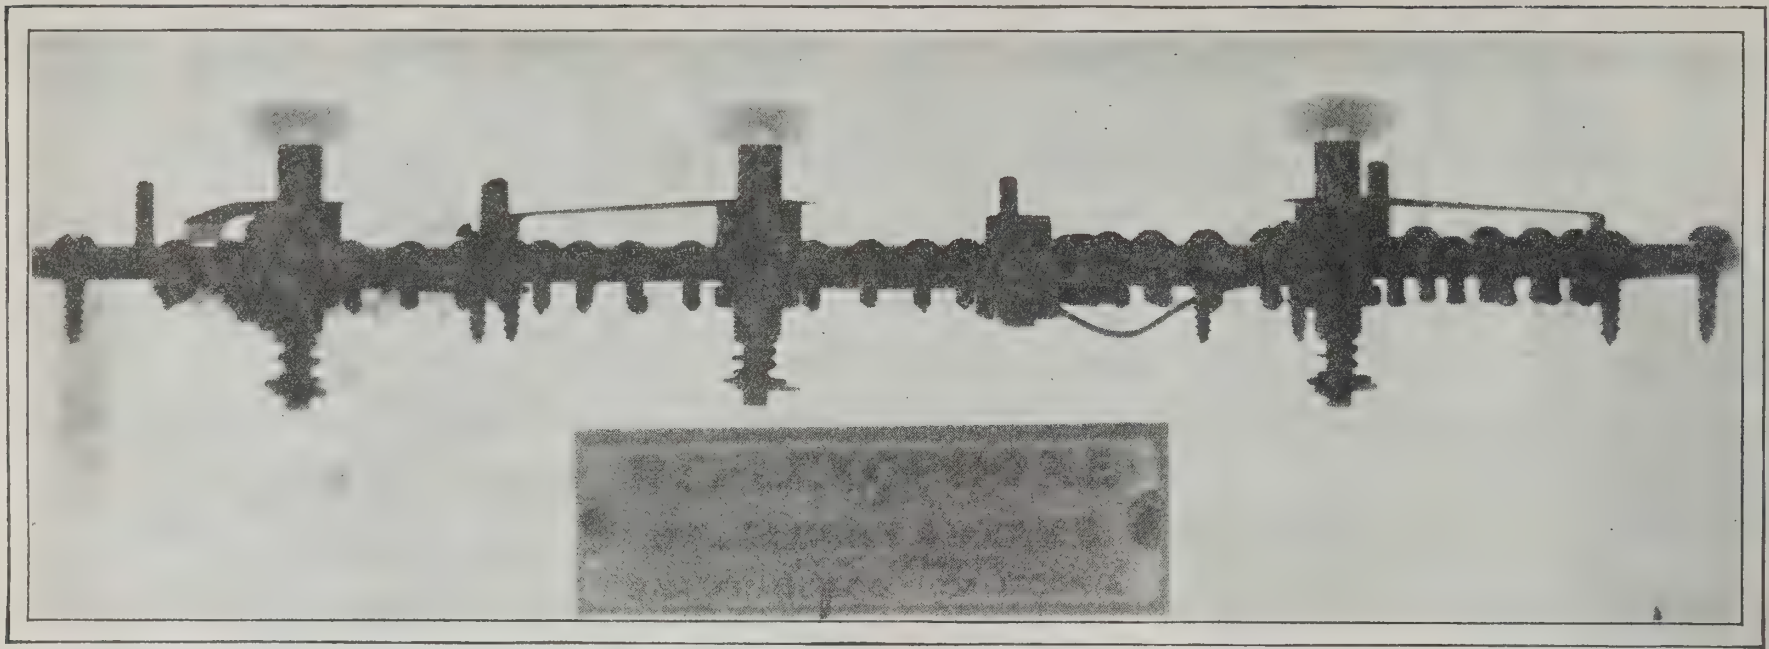
CHRONICLER OF THE NEGLECTED TRUTH



An X-Ray photograph, through the side of a "reflexophone," one of two used by Dr. Albert Abrams in his diagnostic instrument described herewith. A "reflexophone" consists of three resistance coils, or rheostats, simply and poorly made. Each "reflexophone" has a total resistance capacity of 61 ohms in all three of its rheostats. When one considers that the ohmage of the ordinary electric light globe is approximately 500, the trifling character of these "reflexophones" and their utter worthlessness and incapacity for handling vibrations at the tremendous rates with which Abrams claims they do handle these vibrations is at once apparent. Like the "amplifier," the "reflexophone" is merely a "mystifier," and apparently accomplishes the purpose for which it was designed. Dr. Abrams has charged that the tests of his "oscilloclast," on which a recent article in The Dearborn Independent was based, were made after the machine had been opened and tampered with. This charge is false in every detail, but, to obviate its recurrence, the four instruments constituting the Abrams Diagnostic Machine were subjected, just as they came from the workshop of Dr. Abrams, to X-Ray photography. When so photographed, they were closed and had not been opened since leaving the hands of their manufacturer. After they had been searched by the X-Ray, and their character as simple and poorly made rheostats established, they were subjected to ohm-meter tests, before being opened. Thereafter, their interiors were examined and tested by electrical engineers of the highest standing, and every test supported the finding of the X-Ray.

Abrams' Machine a Trap for the Unwary

Complicated Equipment for Producing New Force Fails to Register on X-Ray

By ROBERT MORGAN

OF ALL the men who have played upon the hopes and fears of their fellow men since written records began to be kept, few have achieved the notoriety or the following gained by Dr. Albert Abrams, a San Francisco Jew, the worthlessness of whose cure-all instrument, the "oscilloclast," was exposed for the first time in a recent issue of The Dearborn Independent. Obtaining the degree of M. D. from Heidelberg University at 19, Dr. Abrams has had a meteoric and not always clear career in the practice of medicine, in pathology, in bacteriology, and through the ranks of the American Medical Association, until today he finds himself at the head of a cult which has more than 3,000 members in the United States.

This organization, known as "The ERA Association," the mysterious letters standing for the "Electric Reactions of Abrams," is spreading far and wide a method of diagnosis and treatment of disease which may well send thousands of men and women to untimely deaths, since the time required by this utterly futile "treatment," enables whatever disease the unfortunate patient may have so to intrench itself that, by the time the patient calls upon a reputable and skilled physician, it may well be too late to do anything but make the inevitable a little less hard to bear.

The ERA Association is composed for the most part of men—and some women—who have obtained licenses to practice their various schools of healing, many of whom have failed at the regular practice of medicine or surgery. They may be divided into two classes: Those who honestly believe that Abrams has found and founded a new and real method of healing, but who are so ignorant of the principles of medicine that they should be barred from trifling with the lives of men and women; and those who see in Abrams' "inventions" a means of acquiring wealth within the law, irrespective of the results to the victim. These should be in our penitentiaries, not in physicians' offices.

Back of them sits Albert Abrams, issuing at frequent intervals announcements of new "discoveries," directions for new methods of application of his instruments, and just now claiming the discovery of a new force or energy, hitherto unknown to man, and unappreciable by any known instruments or laws of electricity, physics, chemistry or medical science. Down to date, Dr. Abrams has persistently refused scores of offers to demonstrate his claims and his instruments before scientific bodies; to explain the new energy he declares he has discovered, or to make public experiments before impartial and competent men in all branches of scientific study. Meanwhile there is pouring into the coffers of this clever Jew the hard-earned money of his "patients," and of the physicians who are using his instruments, at the rate of more than $10,000 a month, according to the estimates of a score of leading physicians of San Francisco, who, aroused by the growth being made and the harm being done by the ERA cult, are now keeping close watch on the Heidelberg graduate at 2151 Sacramento street.

In spite of Abrams' attempts to bind the lessees of his machines to secrecy, and in the face of his repeated refusals to meet fair tests of the truth of his claims, the writer has obtained some of the instruments constructed and leased by Dr. Abrams. One of these, the "oscilloclast," by which Abrams and his physician-disciples pretend to be able to cure any and all diseases, has been described in these columns. Accurate tests, made with the latest and most delicate instruments, by the most competent electrical engineers of San Francisco, demonstrated conclusively that the "oscilloclast" delivers absolutely nothing to the patient who is given treatment with it. Not only is it a crude piece of work, seemingly built by a 10-year-old boy, who knows a little about electricity, to mystify an eight-year-old boy who knows nothing about it, but its total cost is not more than $30, yet Abrams leases this machine at $275 (lately raised from $200) cash payment, and $5 a month as long as the lessee retains it. That for the "oscilloclast."

But, to apply the oscilloclast, Abrams must first find the disease to which its cure-all "vibrations" are to be applied. The modern physician usually calls to the aid of his own diagnostic training the all-seeing eye of the X-Ray, the telltale thermometer, the stethoscope, which enables him to listen-in on the heart and lungs, and other instruments which time and use have proved reliable. Not so Dr. Abrams. Possibly the sales of the common medical instruments were all in the hands of other manufacturers and distributors; possibly they were not mysterious enough to conform to the Electronic Reactions of Abrams. In any event, he devised, invented, and now has "patent pending," a machine which, if his claims are to be believed, is capable of diagnosing disease "with only one per cent of error."

The patient may or may not be present when the "mechanical diagnosis" is made; in fact, it is not essential that the patient—currently called the "victim" in the offices of members of the ERA—be present at all. A drop of his or her blood is ample, and the drier the blood the better, just so it is on a piece of "clean white blotting paper." From that drop of blood, placed in the "dynamizer" of the Abrams Diagnostic Machine, the discoverer of Electronic Reactions tells you immediately just what is the matter with you—and in nine out of ten cases it is declared he will find syphilis, cancer or tuberculosis, favored in the order named. Autopsies on a number who have failed to recover, largely because their money gave out before the treatments were completed, have proved that they had no one of the three specialties of the ERA cult, but the operators of the diagnostic machine and the oscilloclast *had the money,* and, presumably, *the patient had the experience.*

Abrams Claims Discovery of New Form of Energy

IN ATTEMPTING to reply to the article descriptive of his "oscilloclast," published in a recent issue of THE DEARBORN INDEPENDENT, Dr. Albert Abrams announces that the "force" or "energy" produced by his instruments is "unappreciable, unidentifiable, and unmeasurable by any known form of scientific instrument."

Since the only claim made for his contraptions by Abrams is that they are *producers* of this "new form of energy," it is obvious that Abrams must have discovered, appreciated, identified and measured his "new force" by means of instruments already devised and in use by other scientists. If he did not so identify and measure it, *how does he know that he has found a new form of energy?*

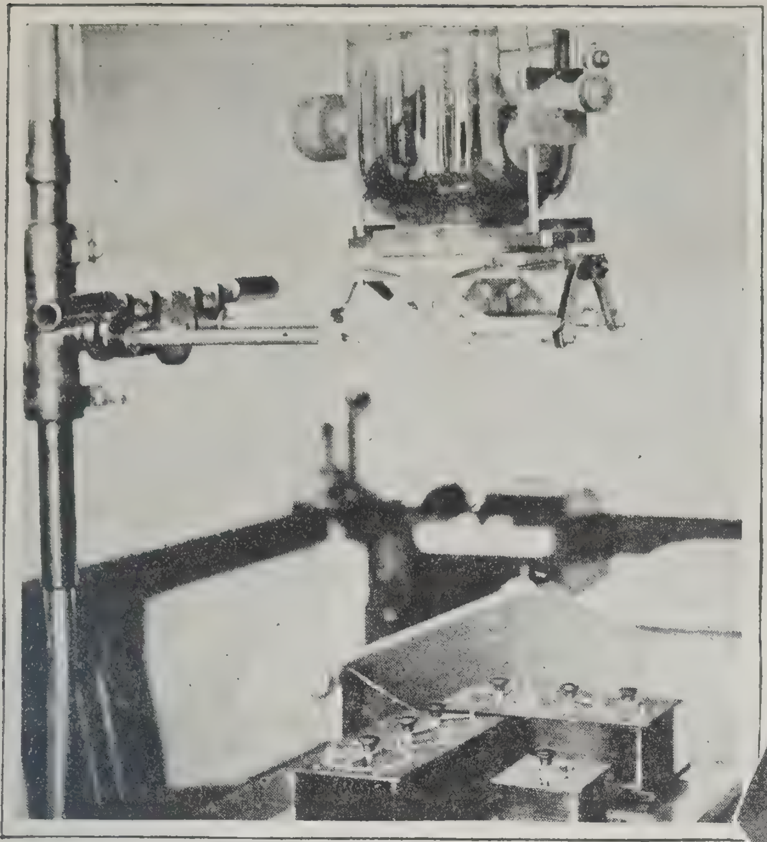
When Dr. Abrams answers this question in an intelligent manner, his claims will be subject to serious consideration by men of medicine, electrical engineers, and experts in physics and chemistry. Until he does give, demonstrate and prove his answer, his work must be regarded as that of the character described by this and a preceding article.

The writer, having tested and discussed the "oscilloclast," proposes, in the present article, to describe the tests made of the diagnostic machine, and the results obtained from these tests. There are, of course, two methods of approaching the Abrams problem—and, make no mistake about this, it is a very real and a very serious problem, because there is being placed in the hands of hundreds of ignorant or unscrupulous so-called "physicians," in this country, instruments whose very worthlessness is allowing death to overtake, or permanent illness to incapacitate, persons who, in the hands of skilled, honest physicians and surgeons, could be saved. *It is not too much to say that the ordinary electric vibrator, which can be purchased of any reputable electric or drug supply house for $5 to $10, is ten thousand times as effective in the treatment of any disease known to man, from a headache to a broken limb, as are any or all of the inventions of Abrams,* because the vibrator actually transmits to the skin and flesh a mechanical energy which stimulates the flow of blood, and aids the white corpuscles of the blood in reaching the point of damage in the body, while the Abrams instruments deliver absolutely nothing, not even electric current, to any part of the anatomy of the "victim."

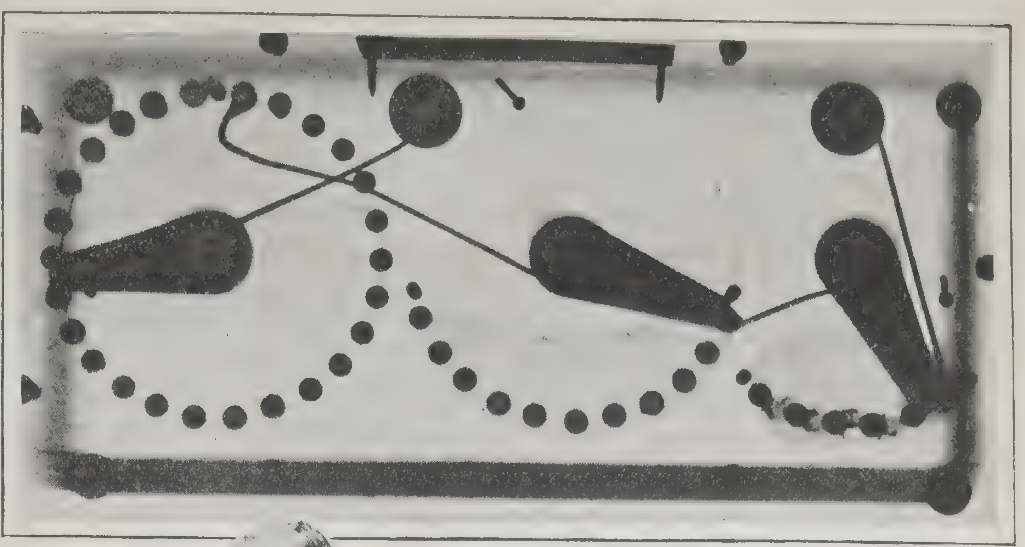
The two methods of approaching the Abrams problem, mentioned above, are mechanical and logical. The oscilloclast was discussed from the mechanical point of view; the present article will discuss the diagnostic machine from the same angle. Later, all the inventions of Abrams will be discussed from the point of view of the logic, science and practice of medicine, the discussion taking the form of statements by physicians and surgeons who have come into contact with the "inventions" of Abrams and with the "electronic reactions" which Abrams claims actuate his machines.

The diagnostic machine, invented by Abrams and leased by him at $150 cash payment and $5 a month as long as the lessee keeps it, costs approximately $20 to produce, complete, with all connections. It consists of six sections or units, any one of which is useless without all the others, according to Abrams' announcement, and, it may be added, all of which are equally useless, either with or without any unit. The first section consists of the "Dynamizer," a disk of vulcanite, or other hard composition, containing a circular depression in the center, into which are introduced two sliding rods of steel, each of these rods provided with sockets for wire connections at each outer end, and each flattened on the inner end, so that, when brought together inside, they form a small platform. The cover of this cavity is a disk, also of vulcanite, lined with a thin sheet of metal, presumably steel, and having one socket, for the reception of wire connection, rising from the center. Into this dynamizer, Abrams introduces a tiny piece of blotting paper, which must be white in color, containing a drop of blood from the patient to be diagnosed, laying the blotting paper on the small platform formed by the two steel rods.

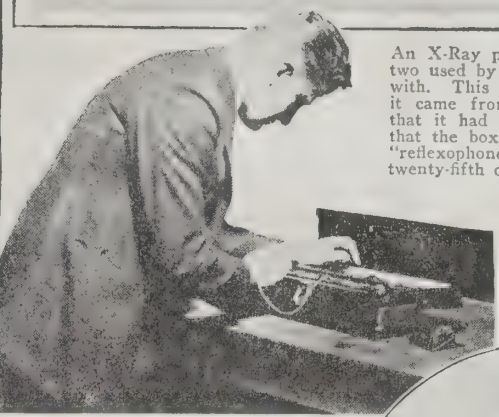
The second section consists of the "Amplifier," or "Stepper-up," by which Abrams claims to multiply the vibrations of the electrons in the drop of blood in the dynamizer "to 50,000 times the rate of radioactivity." This "Amplifier" consists of a wooden box, painted black, containing a three-point switch on the outside, and a coil of wire, covered with paraffin or other soft material, and then copiously shellacked or varnished, on the inside. This is claimed to be the master machine of the combination, the instrument which actually brings



Making the X-Ray photographs of the unopened instruments of the Abrams Diagnostic Machine.



An X-Ray photograph from the top of the "reflexophone," one of two used by Abrams in his "diagnostic" instrument, described herewith. This photograph, which was made of the instrument just as it came from Abrams' factory, so that there could be no claim that it had been taken apart, or otherwise tampered with, shows that the box is a set of three rheostats. Abrams claims, with the "reflexophone," to be able to measure accurately vibrations of one-twenty-fifth of an ohm resistance. Each point on each rheostat was tested several times carefully by an expert electrician, using the most delicate ohm-meter that can be obtained today. Not one of the numbers of ohms indicated on all these contacts was accurate. A grammar-school laboratory would throw such a rheostat out of the window and set one of its pupils to work building another.



Making the ohm-meter tests of the simple rheostats which compose the mysterious "reflexophones" of the Abrams Diagnostic Machine, in the laboratory of the Roentgen Appliance Corporation, San Francisco. These tests showed every point on each of the rheostats to be inaccurate.

within the range of human understanding, the vibrations constantly going on in the blood of every human being.

The third and fourth sections, or units, are identical. Each is named "reflexophone," by Abrams. Each consists of an oblong black box, made of wood, on the cover of which are three contact switches, and inside of which are two coils of wire, also covered with paraffin and shellac, as in the case of the "amplifier." One switch on each cover shows 0 to 50 by tens, each point being numbered; one on each shows 0 to 10, and one on each shows 0 to 25. By these instruments, Abrams claims to find the rate of vibration of the drop of blood in the dynamizer, after that rate has been "stepped up" in the amplifier, and, by this rate, so established, to ascertain the disease with which the patient is afflicted. Then, by setting the oscilloclast—which, bear in mind, is an altogether different and separate machine—at the same rate as that indicated by the diagnostic machine, he professes to cure the disease.

The fifth section of this astounding diagnostic machine, by which a man's religion may be "diagnosed" just as accurately as his illness, consists of four metal plates, presumably zinc, to be laid on the floor. These plates are connected by ordinary insulated telephone cord, with the two steel rods of the dynamizer above described. Two other wires lead from these metal plates to a water pipe, radiator, or any other convenient "ground." The wire which connects plates with the dynamizer also connects the plates with each other. Short similar wires, fitted with plugs at either end, also connect the dynamizer with the amplifier, the amplifier with one of the reflexophones, and that reflexophone with its mate. According to Abrams, the position of the reflexophones makes no difference; either can be used first or second in the series.

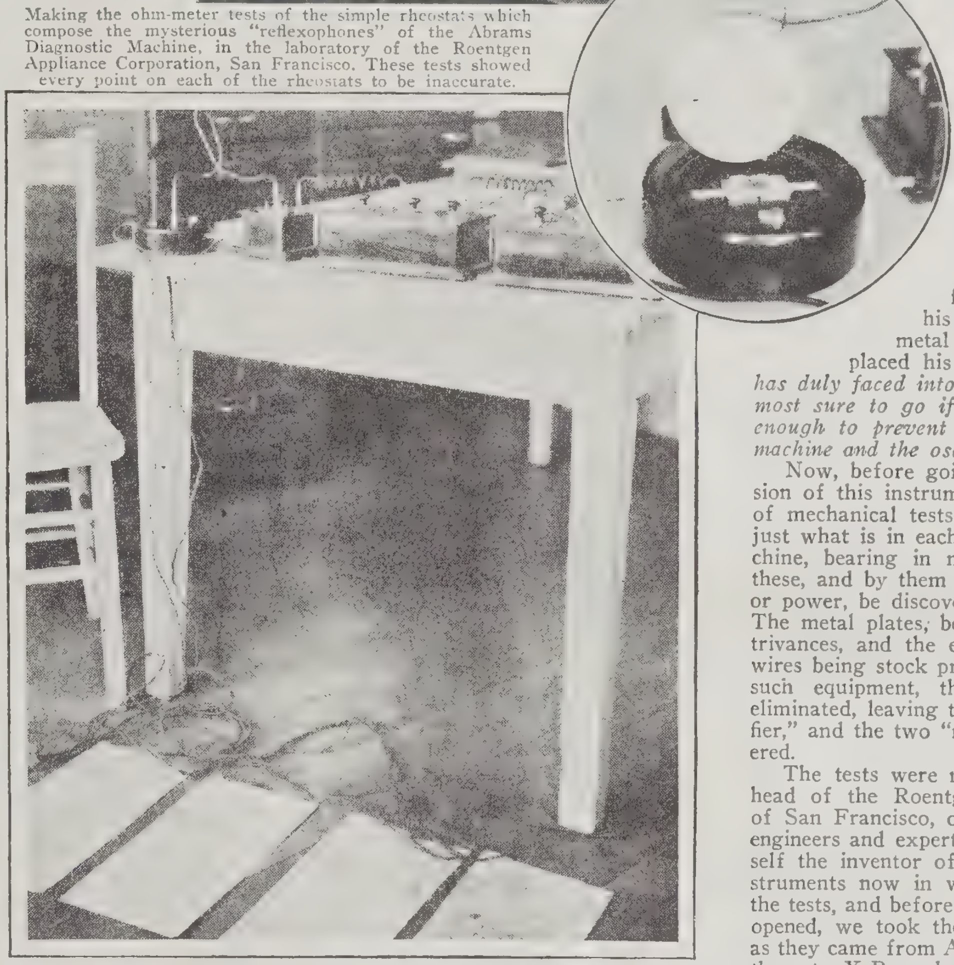
The sixth section of the machine is made up of a length of insulated telephone cord, with a plug at one end for insertion in a socket in the second or last reflexophone, and a plug at the other end for insertion in the handle of an electrode, provided with discs of varying size, which the patient applies to his body—preferably to the forehead—while the diagnosis is being made from the drop of blood in the dynamizer at the other end of the series.

This is the complete diagnostic machine of Abrams, but it should be added at this point that Abrams insists, and enforces the order upon physicians using this instrument, that the patient standing upon the metal plates must face west, "because the magnetic flux of the earth is from north to south, and the patient must be clear of this influence." He also demands that the light in the diagnostic room, while the diagnosis is going on, be "subdued and dim." The physician making the diagnosis sits in front of the patient, putting his feet on the remaining two metal plates, after the patient has placed his feet on two of them, *and has duly faced into the sunset, where he is almost sure to go if his money holds out long enough to prevent his escaping the diagnostic machine and the oscilloclast.*

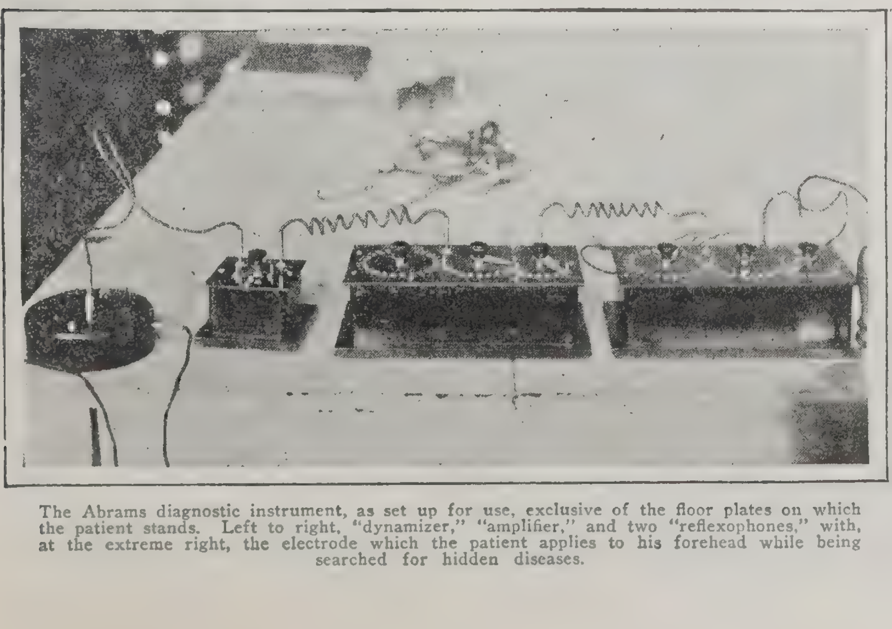
Now, before going into any further discussion of this instrument, let us see, in the light of mechanical tests and scientific investigation, just what is in each unit of the diagnostic machine, bearing in mind that by such tests as these, and by them only, can any force, energy or power, be discovered, recorded or measured. The metal plates, being simple mechanical contrivances, and the electrodes and the insulated wires being stock products of manufacturers of such equipment, these two sections can be eliminated, leaving the "dynamizer," the "amplifier," and the two "reflexophones" to be considered.

The tests were made by Mr. Frank Rieber, head of the Roentgen Appliance Corporation, of San Francisco, one of the leading electrical engineers and experts of the Pacific Coast, himself the inventor of a number of electrical instruments now in wide use. Before we made the tests, and before the four machines had been opened, we took the Abrams instruments, just as they came from Abrams' hands, and subjected them to X-Ray photography, the results being reproduced herewith. The findings of the X-Ray were confirmed when the instruments were tested on the ohm-meter and on the galvanometer, and were further confirmed when the Abrams instruments were taken to pieces and examined by electrical experts. It should be understood that no energy of any kind, electrical, mechanical or chemical, is applied to this diagnostic machine. It obtains its results, ac-

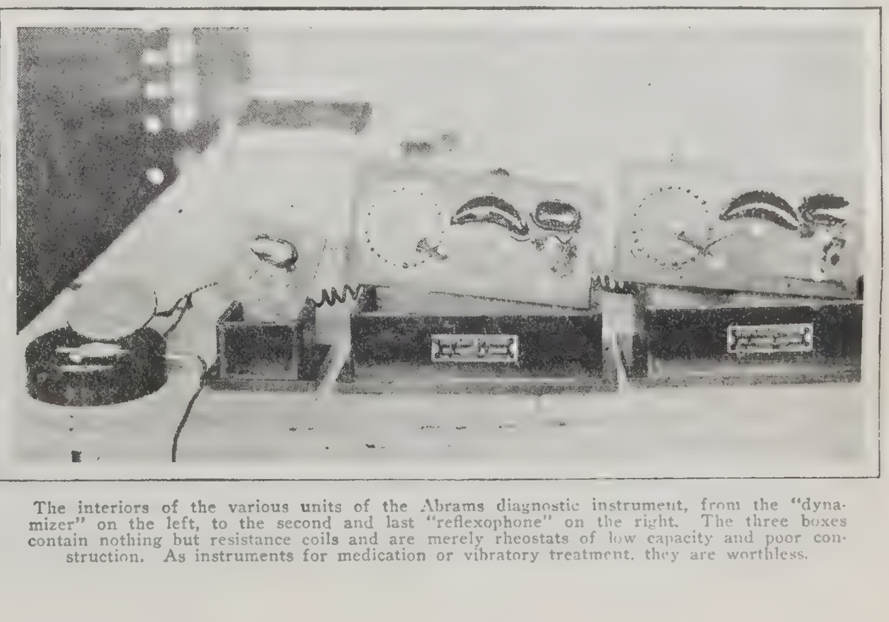
(*Concluded on page 13*)



The Abrams diagnostic instrument set up for use as Abrams uses it. The patient stands on two of the metal plates on the floor, and the person making the diagnosis sits or stands in front of the patient, with his feet on the other two plates. The patient "must face due west and be in a subdued light," according to Abrams' instructions. In circle—The "dynamizer" of the Abrams diagnostic outfit. The dark spot shown on the scrap of white blotting paper in the center is a drop of human blood. From this drop of blood Abrams pretends to diagnose disease, determine the vibrations necessary to cure that disease, announce in advance the sex of unborn children, disclose the religion of the patient, and perform other modern miracles.



The Abrams diagnostic instrument, as set up for use, exclusive of the floor plates on which the patient stands. Left to right, "dynamizer," "amplifier," and two "reflexophones," with, at the extreme right, the electrode which the patient applies to his forehead while being searched for hidden diseases.



The interiors of the various units of the Abrams diagnostic instrument, from the "dynamizer" on the left, to the second and last "reflexophone" on the right. The three boxes contain nothing but resistance coils and are merely rheostats of low capacity and poor construction. As instruments for medication or vibratory treatment, they are worthless.

What Ben Thought of Them

BENJAMIN FRANKLIN'S views upon the United States Senate, American state legislatures, the Versailles Peace Conference, the Lausanne Conference, the South American Conference and all the other assemblages of wise men held during these recent years, have just been received. They are contained in a letter written by Ben to his friend Benjamin Vaughan, Esq., in the year 1784.

"It is wonderful how preposterously the affairs of this world are managed.

"Naturally one would imagine that the interests of a few individuals should give way to general interest; but individuals manage their affairs with so much more application, industry, and address, than the public do theirs, that general interest most commonly gives way to particular.

"We assemble parliaments and councils to have the benefit of their collected wisdom; but we necessarily have, at the same time, the inconvenience of their collected passions, prejudices and private interests . . . .

"And if we may judge by the acts, arrets and edicts, all the world over, *for regulating commerce, an assembly of great men is the greatest fool upon earth.*"

If this was true in Franklin's time, when most of the great work was being done upon which the present generation is built, how much more true is it now that—

"An assembly of great men is the greatest fool upon earth."

Chicago Loses Pittsburgh Plus

CHICAGO is a fortunate city, at present, in that Pittsburgh Plus is suspended, and construction steel is now available there at prices which are considerably lower than those which prevail in other big cities. Thus, at least, runs the announcement of a special writer in *Construction News,* who claims the investigation into the United States Steel Corporation's business methods has caused a suspension of the plan in the Windy City. The general statement that increased building activity in Chicago is due to a settlement of labor disputes in the building trades, is not the only nor the chief reason for this happy state of affairs, according to Frank Emerich, writer of the article in question, who says:

> "Chicago buys its steel for considerably less than does New York, although under normal conditions steel prices in these two cities are precisely the same, because of the Pittsburgh Plus plan. That is, without regard to where the stock is produced, normal steel price is the price at a Pittsburgh mill, plus the amount of money required to haul the steel from Pittsburgh to the point where it is to be used."

The suspension of this rule in Chicago's case amounts to a saving of 20 per cent on New York prices.

The continuance of Pittsburgh Plus would in time mean the disappearance of Pittsburgh as the leader in the steel industry. As industry expands, as the needs of wider areas of states become more pressing, as the burden upon transportation increases, and as the well-known arrogance which preeminence occasions becomes more apparent in arbitrary manipulation of prices, it is only a matter of time before St. Paul or Minneapolis, with their near-by ore fields and their water power for electric foundry work—it is only a matter of time before other cities near undeveloped ore and fuel fields will begin to ask, Why Pittsburgh Plus? Why not Home City Plus?

The recent brisk rebellion against the plan indicates an awakening of American business brains. Too much in the past has business taken conditions as it found them and tried to make money in spite of them. But now business seems to be taking a statesmanly view of the whole situation, and that is a very promising and hopeful fact. American business has been too much money-grabbing and too little statesmanly organization of resources and production. It appears now to be waking up to the bright dawn of a new era.

Emerson Hough

THE untimely death of Emerson Hough closes the career of one of the truest of all American conservationists. It was through his efforts that the preservation of the wild life of our remote sections first received intelligent consideration. During the winter of 1895 he traveled over Yellowstone National Park on skis, and it was due to this trip that Congress passed the act protecting the buffalo of the park. Much of the material for his later books of adventure and early pioneer life was gathered by him during his earlier years while traveling in the out-of-the-way corners of America. It was largely through his efforts that Americans were led to appreciate the natural beauty of their own land. He preached in season and out of season that American beauty spots surpass in scenic magnificence anything that the Old World can offer. He contested unceasingly the efforts of certain individuals to exploit the forests and water power of our national parks and his incessant endeavor to preserve outdoor America brought results. He lived to see out-of-door America more intelligently loved and cherished than when his work began.

The Modern Atlas

INTERNATIONAL finance, by which term is meant the close-knit combination which aims at world domination and sometimes seems likely to acquire it, neglects no opportunity to repeat the performance of the mythical god, in holding up the world, although in its case the holdup is that of the footpad rather than of the sustaining shoulder.

Formerly, jealous of the encroaching power of the United States, South Americans sought capital in Europe. This source of supply was exhausted in the World War, but the appetite for borrowing grew, and the natural result is that public financing has come to American bankers.

The extent to which public loans have been made is partially shown by an almost complete list of operations, since 1921, as follows:

Guatemala	$ 15,000,000
Cuba (new loan)	50,000,000
Haiti	7,500,000
Colombia	4,000,000
Application for $80,000,000 pending	
Province of Antioquia (Colombia)	20,000,000
Ecuador seeks	33,000,000
Peru	50,000,000
Bolivia	33,000,000
Chile	44,000,000
$12,000,000 more asked for	
Brazil	50,000,000
Rio de Janeiro	12,000,000
Rio Grande de Sol	10,000,000
Ceara	2,000,000
Uruguay	13,000,000
Argentina	250,000,000
$110,000,000 more wanted.	

As security for these loans the countries generally pledge their customs receipts, the provinces their internal revenues, and the cities their receipts from all sources. Concessions of natural resources are also given, while in the case of Guatemala a national banking concession and the retirement of the state currency is provided for.

Most of these loans are of recent date. Naturally they have reduced the volume of money in this country to some extent, although not so greatly as many would imagine, as naturally a part would return in payment for American products. The presence of the entire world in our markets as borrowers, however, increases our interest rate level while shortening the money supply, making a combination not calculated to make the world happier, but putting Shylock on Easy Street for years to come

Now It Is the Pope!

IT IS now the Pope who is "anti-Semitic"! *The Canadian Jewish Chronicle* rises in wrathful denunciation against Pius XI because of the report that he wanted to appeal to the Jews of the world to use their influence with the Russian Soviet to cease their war against Catholic priests. The *Chronicle* can see no reason for the Pope having considered such an act unless it be—"Is he trying to provoke a holy war? To what other motive shall we attribute the insinuation that the Jews are the rulers of Russia . . . .?"

The Dearborn Independent, two years ago, was a voice in the wilderness warning the world that Bolshevism was not Russian nor revolutionary, that it was Jewish and represented the fight of that race for the riches of Russia. Our statements were denied by all the spokesmen of Jewry, especially those who live by Jewish advertisements. Even Mr. Brisbane, who was at first very skeptical, does now admit that the only brains left in Russia are Jewish—the others having been killed off. Newspapers are everywhere printing the truth about the character of Bolshevism. Government reports attest every fact that The Dearborn Independent set forth. As a new instance of the growing frankness and independence of the American newspaper with reference to this matter, the recent articles of Francis McCullaugh may be cited, who has told the truth fearlessly and without any other bias than decency usually has against indecency. The American editor has been educated and the case is established.

One editor has yet to learn, the editor of *Hearst's,* Norman Hapgood. He is now in Russia, at last accounts, "sitting in" at the unfrocking of ministers of the Christian religion and cabling to the American press defenses of the Soviet's attitude toward the church.

Some leading Jews have admitted that Bolshevism is Jewish and have asked the lenience of the Christian world for what is undoubtedly an aberration of traditional Jewish attitude. For this honesty they have been torn to pieces, figuratively speaking, by their racial fellows. But it is a confession which ought more widely to be made, that the fact may stand out clearly and that good Jews and good Christians may know what to do with regard to it. The tissue of falsehoods which comprise the denial that Russia is today ruled by Jews, is befogging an issue which ought to be joined on right terms and not on terms which will surely mean serious misunderstanding.

So that if it is true, as the *Chronicle* says, that the Pope contemplated appealing to the Jews, he was doing just what any informed authority would do. There is no one better informed on international matters than is the Pope, *and he knows who rules Russia.* More than that, *he knows who is behind the rulers of Russia.* His undoubted knowledge in this matter evidently renders him open to the charge of being "anti-Semitic," as it seems to have done for all the rest of us.

Stock Exchange Protects

THERE has been a crusade the country over against gambling on "the ponies" and many newspapers have featured the campaign as one to which every good citizen should subscribe. Makers of books in this particular field of sports have been pictured as harpies, fleecing the poor "boobs" who imagine they can guess which way the swindle, for most bettors lack confidence in the honesty of the game, will direct the winnings.

The chances of making a killing in a horse race are greater, often, than for a similar win in Wall Street, where the wool clip is measured in larger sums than on the turf. Yet the movement of trading in the New York Stock Exchange and on the curb is faithfully related for the benefit of an equally insane crowd who watch the ticker.

When the bookmaker of the turf loses beyond his ability to pay, or for some reason refuses to pay his losses, he is ostracized by the fraternity. No meaner name can be given him than to call him a "welsher."

The New York Stock Exchange member, however, is more fortunate, for when he is squeezed too hard the governors of the organization step in and dictate the time and terms of settlement. "Welshing" is not proscribed.

If a customer is caught "short," he must put up margins until his resources are exhausted. But if the customer gets the better of the crowd and catches them "short" of a stock in which he has control, he must settle on the terms the Exchange Board stipulates.

Gambling in stocks is not a whit more respectable than gambling on horse racing.

Mr. Ford's Page

TO TAKE up again the fact that the farm population of the country is decreasing, one is glad to recognize that at last a government official has made an effort to lift the public mind out of the rut of conventional thought on the subject. Until now it has been the custom to treat this fact with loud predictions of ruin. "The boys are leaving the farm; what shall we do for bread?"—that is the familiar form of the lament.

Well, for that matter, the boys are leaving the army, too; they are leaving off driving horses; they are leaving all the jobs and places where they feel they are not needed, where they feel there is not a future for them, and they are instinctively finding their way to those places where destiny intends them to be when this new era gets properly going.

People have no faith about these things. They have not perceived that law operates in the affairs of men as elsewhere. They seem not to know that as the birds fly south and then north, as the tree sends its sap down and then up, so do races and generations of men move hither and thither in response to a law which is the instrument of cosmic purpose. If people had faith about these things they would save themselves a great deal of trouble and they would be in a better position to enjoy the exquisite pleasure of "living in the minute."

How many alarms and laments we have heard! The sun is going out! The supply of coal will soon be exhausted! Wood will soon be a rarity! How familiar all these cries are. And yet people talk about faith! The sun will last as long as we need it. When coal is used up we shall have a better world. And as for wood, ours is the only country in the world which builds wooden cities (save the bamboo villages of the jungle) and it will be a deal better when we come to build stone cities and brick cities and cement cities—a deal better for men to buy houses that will not fall down before their lives are done. But we had to build wooden houses to learn what a house should be. The world has learned more about houses from the perishable American wooden house than from all the other houses ever built, and by the time wood is gone for this purpose we shall know enough about the perfect house to build it perfectly out of materials that will endure for centuries. Nothing is wrong about this great movement of racial experience, and nothing is going to be wrong—if people would only look at the facts with the faith which they reserve for everything but practical things.

WHEN birds fly north, and when people migrate from one continent to another, and when men leave one form of labor for another, look at the fact of it before you let anyone fill you with the fear of it. There is a great migratory movement from the farm to the city, but it does not mean what the alarmists say it does. It means that the farm "overhead" in men is decreasing. The Farm is the only institution that has fully supplied the world with its product. There is Food enough, but there are not manufactured articles nor Transportation enough. When Manufacture and Transport have supplied the world as well as Agriculture has, then we shall be on a civilized basis. What is occurring is this: The Farm is releasing men to help Manufacture and Transport catch up.

Well now, apply the same principle to the change that has come over farming. For that is the correct way to say it—some people think it is a change that has come over *farmers,* but this is not the case. It is just the same as the change that has come over spinning. Think of the hundreds of thousands, yes, the millions of people who would be spinning in this country today if a change had not come over spinning. One girl can spin today more than hundreds of women could spin a century ago. Suppose someone had cried, "Oh, all the women are leaving their spinning, what shall we do for cloth?" The answer is, You shall have more cloth.

Agriculture was the foundation industry of the country, but it no longer stands alone in that important honor. Agriculture, instead of being now only a source of supply, has become a source of demand, too, and it has separated from itself an increasing number of producers to meet its needs. The tools of agriculture are not made on the farm but at the center of agriculture by men who would still be on the farm, and who would have to be there, if there were no tools. Tool-Farming was the first great emancipation that came to the multitudes engaged in tilling the land, and upon the heels of Tool-Farming came Power-Farming which liberated thousands more but which will in the future liberate thousands where now it liberates one.

So that the movement from the farm does not mean what the city theorists have tried to tell us. It means that the need of man-power on the farm is decreasing. It means that no one must now stay on the farm for lack of other opportunity. It means that farm production can now be kept up with less drudgery and less man-power than ever before. It means, in brief, that old-time farming is on its way into the dim past and that the new era is opening on the wheat fields, too.

It means more than that—it means a shifting between city and farm of another class of people, of whom the alarmists have taken no note. People who note with fear the exodus from the farm to the city are peculiarly blind to the influx of city people into the country. It is one of the strangest and also one of the most pleasing observations to see how naturally the farmer's boy adapts himself to the requirements of industrial communities, and then again to see how naturally the city-raised man takes to farm work, especially where Power-Farming is the rule.

This interchange of experience and adaptability cannot fail to be of benefit to the nation. To have the rural population possess themselves of city experience and to have the city people gain the benefit of country experience cannot have any other effect than that of making a well-rounded community life and mind. This, with the automobile, is making our people masters of the three basic arts—Agriculture, Manufacture and Transportation.

The one commodity with which the world is well supplied, so far as quantity goes, is food. Agriculture has never fallen down on its job of supplying the world. Commerce has often fallen down in the work of distribution, and speculation has often neutralized the blessings of agricultural ability and honesty. However, through Agriculture the food supply of the world is secure; as long as Nature holds her accustomed course, no one need worry. More food can be produced at less cost and with fewer men than ever before in the history of the world, and it will not be long before food will be the least of our "cost-of-living" worries.

Now, this cannot be said of any other department of universal service. There is not another line whose output is sufficient and, being sufficient, will still be increased at less cost of labor. Take the other two arts—Manufacture and Transportation. Take them only with reference to the farm itself. Has the farm all the manufactured articles it needs? Has the farmer all the modern implements he needs, and tractors and machinery? Has the farm home all the modern conveniences it should have? Has the farm wife all the equipment she should have to lift drudgery off her shoulders? To every question like this which affects the art of Manufacture, the answer is, No. Well, this simply points the necessity of Manufacture doing as well for Agriculture as Agriculture has done for the world.

Take Transportation. Has the farm, the city, the country enough transportation? Have both Agriculture and Manufacture enough Transportation? Again the answer must be, No.

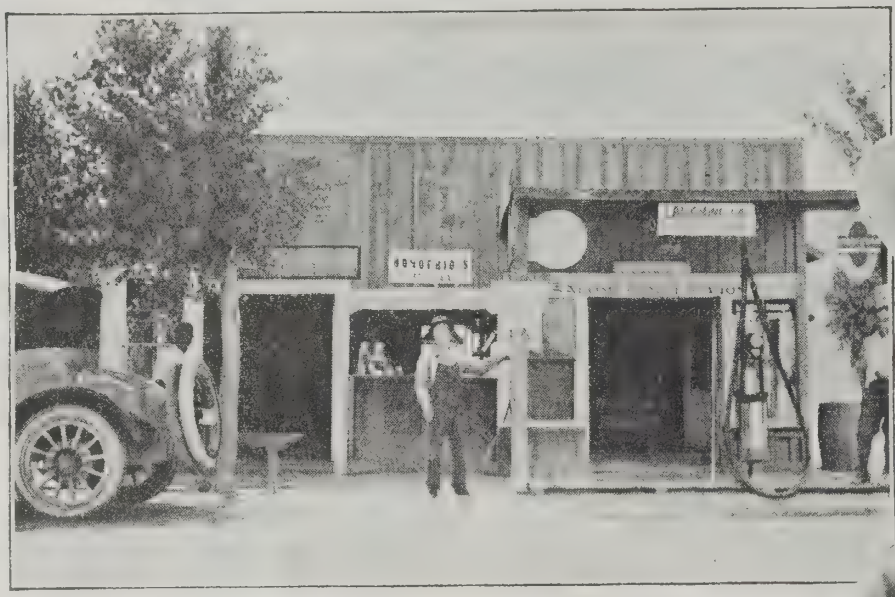
Why then should it be a mystery that men leave the farm when Agriculture has really achieved its task of production, and Manufacture and Transportation have yet to do so? Are the world's needs yet supplied? People who live on good streets seem to think so. Go back into the forgotten areas of your town and see how rare is the porcelain tub and all the indispensable utilities of a really human life. These things are yet to be made and supplied to these people so that the basic decencies of life shall be the same for rich and poor alike. We all have food—food is the business of Agriculture: but we have not all of us the manufactures and the transportation we need. It is a matter of man-power flowing where the need of the world calls it.

A volume of 346 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

The Arizona Man Who Made Salome Dance

How Dick Wick Hall Found and Paved "Yumaresque Highway"

By J. M. SEABRIGHT



Laughing Gas Station. "Chiquita Bill" is the man in the picture.

DICK WICK HALL, "Editor and Garage Owner," who has made millions laugh over his intimate pictures of Salome, Arizona, and her people.

THIS article, notwithstanding its title, has naught to do with the terpsichorean art of the daughter of Herodias, nor does it try to paint the life of Oscar Wilde.

It depicts something closer to home, something and somebody of the earth earthy; the story of a man who enlarged a speck on a map into the range of our vision by means of the magnifying glass of humor, and thereby brought himself into renown.

Salome, in this connection, connotes a town—a town destined until lately to pursue the even tenor of its way, or, changing the figure, to waste the sweet humor of its existence on the desert air.

Salome was on the map—the dry sizzling map of Arizona—long before it danced its way into the spotlight of our knowledge. But it was static. It lay lazily on its back, daydreaming, content to be classed with such phenomena as amoebae, small boys on their way to school in marble time, and father income-taxward.

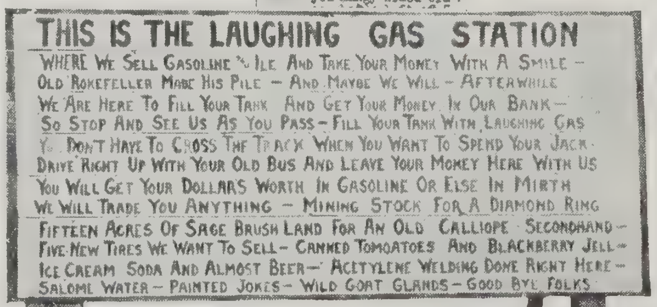
Water was scarce with Salome, and her tongue was parched and cracked. And in the course of time she came to thirst for more than the physical. She needed that inexpressible something which only a psychoanalyst can prescribe for the satisfaction of an impotent urge. She was a pancake on the griddle of surrounding desert, but —she was a pancake minus the yeast!

Salome's Coué, or her Mr. Fleischmann, depending on your choice of figure, proved to be one of her own inhabitants. His name is Dick Wick Hall. O. Henry could have immortalized him within the compass of a few words—and would have done so! For he combines within himself the practical and the stuff of dreams—an O. Henry-like combination reflected in Hall's self-bestowed title of "Editor and Garage Owner," an appellation conjuring up visions of an American caliph in an American Bagdad, drawn so vividly by the lamented Porter. But the phrase reminds you of only two of his many talents: it omits mention of him as miner, prospector, good-roads enthusiast, philosopher and humorist. Truly his career has been more than checkered; it has been kaleidoscopic.

The rise of Dick Wick Hall—his real name, by the way—sounds like fiction. Some students of his life assert that he has achieved success —his literary success, they mean—by accident. Even Hall himself, with characteristic modesty, admits it. But although the golden thread of good fortune runs through the warp and woof of his life, it catches your eye because it contrasts sharply with the rather somber background of effort.

You will find Dick Wick Hall a mining man primarily, his letterhead bearing the legend, "Investments—Mines—Lands," and showing in dim relief a view of part of his mining properties. His migration into Writing Valley came about unexpectedly. Several years ago, the mining business languishing in the doldrums of depression, Hall cast about for a way in which to make the trade winds blow again. Realizing that scores of tourists motored daily through Salome en route to and from California, he opened a service station from which he supplied them "laughing gas" and from the tank of which he piped into their tires "that soft Salome air—it rides easier."

Hall's aggressiveness led him to seek more business, which demanded more tourists, who, in turn, demanded better roads. Roads—the basic reason for the decreasing or increasing of his volume of trade! The county board of supervisors controlled the condition of the highways which, he tells us, resembled the rabbit tracks that crossed them. He would galvanize those supervisors into action or know the reason why!

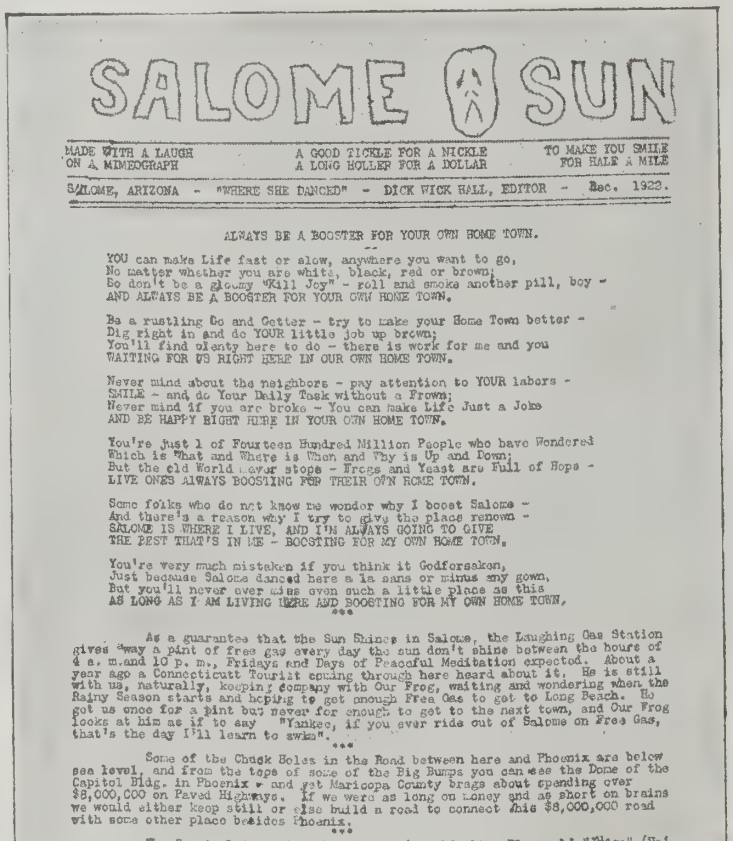


THIS IS THE LAUGHING GAS STATION

WHERE WE SELL GASOLINE 'N ILE AND TAKE YOUR MONEY WITH A SMILE —
OLD ROKEFELLER MADE HIS PILE — AND MAYBE WE WILL — AFTERWHILE
WE ARE HERE TO FILL YOUR TANK AND GET YOUR MONEY IN OUR BANK —
SO STOP AND SEE US AS YOU PASS — FILL YOUR TANK WITH LAUGHING GAS
Y. DON'T HAVE TO CROSS THE TRACK WHEN YOU WANT TO SPEND YOUR JACK
DRIVE RIGHT UP WITH YOUR OLD BUS AND LEAVE YOUR MONEY HERE WITH US
YOU WILL GET YOUR DOLLARS WORTH IN GASOLINE OR ELSE IN MIRTH
WE WILL TRADE YOU ANYTHING — MINING STOCK FOR A DIAMOND RING
FIFTEEN ACRES OF SAGE BRUSH LAND FOR AN OLD CALLIOPE SECONDHAND —
FIVE NEW TIRES WE WANT TO SELL — CANNED TOMOATOES AND BLACKBERRY JELL —
ICE CREAM SODA AND ALMOST BEER — ACETYLENE WELDING DONE RIGHT HERE —
SALOME WATER — PAINTED JOKES — WILD GOAT GLANDS — GOOD BYE FOLKS

A message advertising Salome's center of interest. Not an electric sign, nevertheless it scintillates.

Thus he resorted to his mimeograph and got out the first issue of a miniature newspaper, which he called the Salome *Sun*. His main idea was to poke fun at the supervisors; before he had finished he was shooting them with shafts of wit dipped in the acid of satire.



SALOME SUN

MADE WITH A LAUGH ON A MIMEOGRAPH — A GOOD TICKLE FOR A NICKLE A LONG HOLLER FOR A DOLLAR — TO MAKE YOU SMILE FOR HALF A MILE

SALOME, ARIZONA - "WHERE SHE DANCED" - DICK WICK HALL, EDITOR - Dec. 1922.

ALWAYS BE A BOOSTER FOR YOUR OWN HOME TOWN.

YOU can make Life fast or slow, anywhere you want to go,
No matter whether you are white, black, red or brown;
So don't be a gloomy "Kill Joy" - roll and smoke another pill, boy -
AND ALWAYS BE A BOOSTER FOR YOUR OWN HOME TOWN.

Be a rustling Go and Getter - try to make your Home Town better -
Dig right in and do YOUR little job up brown;
You'll find plenty here to do - there is work for me and you
WAITING FOR US RIGHT HERE IN OUR OWN HOME TOWN.

Never mind about the neighbors - pay attention to YOUR labors -
SMILE - and do Your Daily Task without a Frown;
Never mind if you are broke - You can make Life Just a Joke
AND BE HAPPY RIGHT HERE IN YOUR OWN HOME TOWN.

You're just 1 of Fourteen Hundred Million People who have Wondered
Which is What and Where is When and Why is Up and Down;
But the old World never stops - Frogs and Yeast are Full of Hops -
LIVE ONES ALWAYS BOOSTING FOR THEIR OWN HOME TOWN.

Some folks who do not know me wonder why I boost Salome -
And there's a reason why I try to give the place renown -
SALOME IS WHERE I LIVE, AND I'M ALWAYS GOING TO GIVE
THE BEST THAT'S IN ME - BOOSTING FOR MY OWN HOME TOWN.

You're very much mistaken if you think it Godforsaken,
Just because Salome danced here a 'la sans or minus any gown,
But you'll never ever miss even such a little place as this
AS LONG AS I AM LIVING HERE AND BOOSTING FOR MY OWN HOME TOWN.

***

As a guarantee that the Sun Shines in Salome, the Laughing Gas Station gives away a pint of free gas every day the sun don't shine between the hours of 4 a. m. and 10 p. m., Fridays and Days of Peaceful Meditation expected. About a year ago a Connecticutt Tourist coming through here heard about it. He is still with us, naturally, keeping company with Our Frog, waiting and wondering when the Rainy Season starts and hoping to get enough Free Gas to get to Long Beach. He got us once for a pint but never for enough to get to the next town, and Our Frog looks at him as if to say "Yankee, if you ever ride out of Salome on Free Gas, that's the day I'll learn to swim".

***

Some of the Chuck Holes in the Road between here and Phoenix are below sea level, and from the tops of some of the Big Bumps you can see the Dome of the Capitol Bldg. in Phoenix - and yet Maricopa County brags about spending over $8,000,000 on Paved Highways. If we were as long on money and as short on brains we would either keep still or else build a road to connect this $8,000,000 road with some other place besides Phoenix.

***

The Sun is late again - but it wasn't my fault. Blame old "J"dgo" (Ha! Ha!) Sealy Jigson, the muck faced old wart hog who was appointed Justice of the Peace for this District. He didn't like it because what the Sun said abo
made him sweat a little, so he come down to the Garage and tried to f

Salome's new newspaper, "made with a laugh on a mimeograph," met instant success. Small of body, it nevertheless emitted a loud bark. The supervisors even imagined they detected the bared teeth of a snarl. And they surmised correctly!

Hall gave copies of the *Sun* to his neighbors, mailed some to the supervisors, and passed others to tourists at the service station. This sheet, mixture of sense and nonsense, of fun and raillery, of wit and barbed sarcasm, of laughter and propaganda, appealed to everyone—except the objects of Hall's darts. Encouraged by its initial success the editor and garage owner turned again to his mimeograph and ground out additional issues at intervals of a week or so until a dozen had appeared.

Meanwhile tourists had carried the *Sun* to the four corners of the country. A copy fell into the hands of Don Marquis, famed "colyumist" then on the New York *Sun*, who printed excerpts—several of them—in his column, "The Sun Dial." Thereafter the paper whose mission is "to make you smile for half a mile" came under the eye of Thomas L. Masson, then about to leave the editorial chair of *Life* to conduct "Short Turns and Encores," the new department of humor soon thereafter to be established in the *Saturday Evening Post.* Mr. Masson, being an expert humor-sleuth, procured from Hall a complete file of the *Sun* and offered him a munificent sum per word for what he could use. He used virtually all of their contents and begged for more. That was last July. Since then *Post* readers have chuckled almost weekly over the intimate pictures of Salome with its handful of people, the so-called county road—the "Yumaresque Highway"—its eternal sunshine, and its seven-year-old frog that, because of the drought, has never yet learned to swim.

Glancing over a typical issue of the *Sun* we read the following extract with its curious capitals: "Salome is famous not only as the place 'Where She Danced'—the Home of my Seven Year Old Frog That Can't Swim Yet—the Only Known Place in all Arizona where Wm. Jennings Bryan ever took a Bath—and some Other Things I can't mention—but it is the Widest Spot on the Main Travelled Road between Phoenix & Los Angeles. (I don't mean that Wm. Jennings Bryan took anything else here besides a Bath; I mean there are other things here.) The Buckeye-Quartzite-Blythe Route is the Best & Shortest to Los Angeles and the Coast—the Only Natural Highway in all western Arizona—just as Natural as it was born because the Super Visors realize that they are incompetent to improve any on Nature, so they don't try to. Our—I should say Their—County Seat, Yumaresque, is over 100 miles from here, the way a Crow would fly if he had the nerve to go there—and the County Officials are so Short-sighted they can't see this far—except at election time when they are after Our Votes—and then the way they beat it out of there in droves and come up here would make you think there was a smallpox epidemic at Yuma."

"Sand Patter," Dick Wick Hall's 7-year-old frog, that can't swim yet, looking for a cloud in the sky.

And the next paragraph runs along in the same genial way: "This is supposed to be a County Highway—a 'Yumaresque Highway'—that you are trying to follow, but Tourists sometimes get lost on account of the jackrabbit tracks crossing the road and confusing them, as it is hard to tell which is rabbit tracks and which is the County Road. We are trying to get a Bill passed at the next Legislature to make the rabbits all follow one trail and go in the same direction. If we can do this and get the rabbits trained to obey the law, we will soon have a much better road than any of the Supervisors ever built up this way. It will be easier to train the rabbits than it will the Supervisors. They won't improve Our Best & Shortest Route by way of Buckeye-Salome-Blythe just because they want to make all the Tourists come around through the sandhills by way of Yuma. If Yuma belonged to us we wouldn't want anyone to see it until it either grew up or got some good clothes on. Yuma always looked to us like Some Thing the River left there during the flood. I think it is a good place to keep away from—for me, anyway."

Concerning Salome's salubrious climate he has this to say: "Salome—'Where She Danced'—is the healthiest and fastest growing place in the United States. Eighteen years ago there was no one here but me and Tom Finnegan and some jack-rabbits and jackasses—and now there's 19 people, not counting some I don't like—an average gain of over 100% a year, pretty good

Cleveland Jews Fight the Interest Sharks

Free Loan Fund Enables Poor to Escape Robbery of Usury

By ALBERT SIDNEY GREGG

FOR an hour one evening I sat in the basement of a Jewish school building on East Fifty-fifth street in Cleveland and watched the Cleveland Hebrew Free Loan Association in action.

The room was very plainly furnished, with a few chairs, and a long table at one side. Behind the table sat Mr. H. E. Eisler, a young attorney, who is secretary of the association. An open record book lay on the table in front of him. At his left was a safe with its doors swung back, and on a chair at his right rested a money drawer containing bills and coin in various denominations.

Marcus Feder, chairman of finance, occupied a chair on the outside at the head of the table, where he leaned back and cheerily greeted the callers.

Men, women, young people and children came and went in a steady stream, making payments or applying for loans. Mr. Eisler conversed with them in English, German or Yiddish, as the occasion required. For the most part the visitors were the poorest kind of Jews, with here and there a Gentile.

Visualize the pushcart man you sometimes see on the street, or think of the junk and paper dealer who does business with a horse and wagon in your neighborhood, and you will have an idea of the type I have in mind. This bit of realism is put in at this point to enable you to make a picture in your mind. If you can recreate the scenes of the evening as I saw them, and sense their deep significance, maybe you will be able to catch the vision that lies beyond.

It is the vision that I want you to see.

A boy in knee pants stepped up to the table. He was poorly dressed, but clean. He held a yellow envelope and a $5 bill in his extended right hand. Mr. Eisler took the envelope, quickly pulled out a yellow card, paused a moment as he held up the bill and asked:

"How much?"

"Three dollars."

Mr. Eisler dropped the $5 bill into his cash box, and handed the boy $2 in change. Then he made an entry in his book, and on the card, and returned the card to the boy, who slipped it into its envelope, placed the envelope carefully in his inside pocket and headed for the door.

Loans Versus Charity

NEXT came a woman who paid $5. She was followed by a fairly well-dressed man who made a payment of $10, and went on without a word.

A medium-sized man, with a full beard and who spoke Yiddish, was next in line. He wanted to borrow $100 for a horse and wagon. He explained that he had saved $50, and that he knew where he could get a good outfit for $150.

Mr. Eisler picked up a blue card.

Rapidly asking questions the secretary wrote down the name and address of the applicant, and the names and addresses of the endorsers. It was all done quickly, and in a very matter-of-fact manner.

"All right," remarked Mr. Eisler, with a friendly nod, as he laid the application on a pile near Mr. Feder. "Come back Thursday night."

Another applicant wanted to borrow $150, but Mr. Feder cut him down to a hundred.

A young matron with a happy light in her eyes gave Mr. Eisler her card with three dollars. Mr. Eisler made the entry, nodded, reached into the safe and brought out an envelope containing a watch and some other jewelry, which the woman had pledged as security for a loan. I saw her make the final payment and get her valuables back again.

An older woman next in line asked for a loan of $100 on a diamond ring. Her application was filled out in the usual way, but without endorsers.

Marcus Feder saw me studying this transaction closely, and hastened to explain:

"Yes, that is part of our plan. We loan on watches and diamond rings to accommodate those who do not wish to ask their friends to endorse their notes. They can borrow $50 or $100 in that way, and refund it in weekly installments. After they get paid up they can make another loan if they want to, and go right on paying it back. The woman who asked for a loan on her ring will probably obtain her money next Thursday night."

Just then two fine-looking, well-dressed young women came along and spoke to Mr. Feder in German.

They talked for a few minutes, made a payment and stepped back from the table.

Leaning over and speaking to me in an undertone, Mr. Feder said:

"Did you notice those two ladies? Well, they are just over from the old country. Their husbands run a grocery, and we loaned them money to pay for passage to America. Now they are paying it back. They work right along with their husbands, and are getting ahead. Sometimes they borrow to discount their bills or buy goods for cash where they have an opportunity to get something at bargain prices.

Finally two or three fellows came along who were unmistakably Gentiles. I am sure one of them was Irish. They made payments and passed out.

"Do you make loans to Gentiles?" I asked Mr. Eisler.

"Oh, yes. There is nothing in our constitution that limits our loans to the people of any one race, nationality or religion, so we lend to anybody who can furnish the required security and complies with our rules."

A young man entered and went directly to Mr. Feder with a questioning look in his eyes.

"Oh, yes," exclaimed the chairman, as he picked up some papers, and ran through them quickly. "Here it is," he added in a moment, as he handed the young man a check for $100.

I was introduced to the young man, and we chatted for a few moments.

"And what are you going to do with the money?" I ventured to ask.

"Pay my tuition at college," he replied with a glow of pride in his eyes and on his face. "I had $50, but I needed $100 more, so I came here."

A youth who was all dressed up and evidently looking for some place to go asked Mr. Eisler:

"Can't I fix it some way so I can mail you a check each week for my payments?"

"No, we can't do that," replied the secretary, shaking his head. "The trouble about paying by check is that your letter is liable to be mislaid, and that would cause a mix-up in our records. You will have to come in and make your payments on Wednesday nights just like the rest."

Then Mr. Feder handed me the applications for loans that had been piling up. They ranged from $15 "for a suit of clothes" up to $150 to "send to Europe." One borrower had paid in full, and then applied for a new loan. Another wanted $100 "to clean up some small debts."

It is a condition of all loans that the purpose for which the money is wanted must be stated. That is to prevent the money being used for luxury or speculation.

As I studied the faces of the people who passed before me that evening I was impressed with their general bearing. They were not asking for or receiving "charity." They were borrowing money in a businesslike way to help get a start toward independence, or to tide them over an emergency. I could not find anything anywhere in the free loan system that would tend to make paupers, but I did see much that would make the Associated Charities unnecessary.

Later during an interview Mr. Feder told me more about the Free Loan Association.

"It was originally started 20 years ago," he said, "to help Jews who came from Russia, many of them poor and destitute, and strangers in a strange land. We had to do something to enable them to get a start. We did not like the idea of charity, so we decided to establish a loan fund. We got together a few thousand dollars which we lent on personal security, *without interest or any cost whatever* to the borrower, and we have kept right on in that way ever since."

"But how do you take care of your expenses and losses?" I asked, very much surprised. "You must make a profit somewhere or you could not keep on doing business."

"In place of making the borrower stand for the expenses and the losses," replied Mr. Feder, "a membership of several hundred persons has been built up, and each member pays in $3 a year. The membership dues create a fund out of which all expenses are paid, and which leaves something to add to the capital. Really that is the way we got the original fund at the outset. In addition to the dues we receive donations and bequests. Some of the very persons we helped, five or ten and even twenty years ago, are paying in $3 a year to keep the fund growing.

"During the 20 years that the free loan fund has been in operation we have made loans amounting to a half million dollars, and in that period our expenses and losses have been *less than one-half of one per cent.* This money has helped thousands to get a start and saved them from asking for charity.

Debt a Sacred Obligation

"MOST loans are for small amounts. The borrowers are self-respecting, industrious people who could not borrow elsewhere except from the loan sharks at ruinous interest. Of 542 loans in one year, 181 were for $25, 138 for $50, 64 for $100, 10 for $200. We used to lend as high as $500 to one person, but we don't do that any more. Our limit now is $300. In place of making a single loan for $500 we encourage the borrower to ask for a smaller amount, pay it in full, and then borrow again. The loan must be repaid in four months in weekly payments, and on the average our capital turns three times a year. A borrower could spread a loan of $900 out over a year by borrowing $300 at a time, paying back, and borrowing until it is not necessary for him to borrow any more. That system keeps the money moving, and is better all around. Any person can borrow as often as he likes, as long as he furnishes reliable endorsers, and pays promptly. Our general policy is to require the signature of one property owner as an endorser for each $25 borrowed, so in case the borrower is unable to pay, the endorsers will be obligated for only $25 each. Of course that custom is not always observed, but we keep to it pretty close."

"Do you have many instances where the endorsers have to make good the loan?"

"Very few, indeed," replied Mr. Feder. "There are cases where we have to extend loans because of sickness or misfortune, but the loans were eventually paid by the borrower.

"Our borrowers regard the repayment of a loan as a sacred obligation. They will all pay if they can possibly keep on their feet and work. If necessary, they will stint themselves in food and clothing to keep up their weekly payments. This idea of regarding a debt as a sacred obligation results from the religious traditions and training of our people. It is inherited, and is still strong in spite of the commercialism which rules the world today.

"My father was a rabbi in the old country, and in the back of his synagogue there was a room containing a box in which the well-to-do placed money for the poor. Each giver went in alone. Any person who needed money could go into that money chamber all by himself and take out whatever he needed, without signing a note, leaving his name, or giving any security. That chest was never empty, because the borrowers always returned the money they took.

They were all controlled by a high sense of sacred obligation. To have kept any of that money would have been like stealing from Jehovah. So it is with those who borrow from our free loan fund today. While we observe the customs of the times in which we live, and require endorsers on the notes of the borrowers, our greatest security is the sense of sacred obligation which our borrowers feel."

At length I induced Mr. Feder to talk about himself. I was interested in this unusual man because he is a thinker, a philosopher, a man of affairs, and very practical in his ideas about the methods that should be used to help people who are in need. He is broad-minded and has a great vision.

Marcus Feder came to America when he was 18 years old, from a town in East Prussia, a region which is now a part of Poland. At first he worked in a grocery store, and then he went into the tobacco business, first as a traveling salesman running out of New York, and later as a jobber and a manufacturer in Cleveland. He had built up a business of $1,000,000 a year, when the Tobacco Trust made overtures to absorb his concern. But Feder fought to retain his independence. The business battle that ensued would make a book full of dark pages filled with incidents of cut-throat commercialism, and the perfidy of false friends who sold Feder into the hands of the enemy. He was outnumbered and surrounded, and his business destroyed by his competitors.

"In the end I got a judgment and they got the money," he added a little grimly. "I lost everything but my manhood and my friends. Because of my extensive acquaintance I decided to go into the insurance business, and with the help of my friends I am building up a good business in fire and life insurance. During my business troubles I had some experience with money sharks, and I know how they can make their victims suffer. I expect to spend the rest of my days fighting private loan concerns that are engaged in robbing the poor under sanction of the law."

The Vicious Circle in Finance

FEDER did not speak bitterly, but he was very decisive. He was not "sour" about it. He did not complain. In the language of the sporting fraternity he is a "good loser."

When he told me of his determination to fight the money sharks, I asked him:

"What is your method? How are you going to get at the offenders?"

"By exposing them, and by promoting *a free loan fund* for all the people, regardless of religion or race. There is a good deal about the idea of a community fund that the people do not understand. Why do so many people need charity in the first place? Why is it necessary to raise $4,500,000 in Cleveland alone for that purpose, and millions more in other cities? It is because of a vicious circle in finance in which the very men who are active in promoting charity reap a big harvest in interest on money loaned to the small contractors who build homes for the poor on borrowed money. Thousands of working men pay more than half their wages for rent and fuel. Why? Because they are taxed the excessive interest charges which they pay in higher rentals for the house in which they live. It is fine business for a man engaged in lending money to extort $10,000 interest in the form of high rent and give $1,000 to the community fund. However, this is only one item on which the money shark makes $9,000. Persons see the $1,000 gift but do not know about the extortion, so they praise the giver for his generosity. Years ago when I was president of the Jewish Relief Society, we paid $5 a month rent for three rooms that now rent for $25. When a poor man living in such quarters is unable to pay his rent because of sickness or misfortune, and applies to the Associated Charities for relief, his rent may be paid for a month or two by the very money contributed by the money sharks. It is cheaper for the money shark to give a little money for charity, than it is for him to relax his stranglehold on the people by which he forces them to ask for charity. This whole subject is a little complicated.

"Most houses erected for working people are put up by small contractors who are obliged to pay a high rate of interest to finance their undertakings. When the builder goes to the banker for a loan at the usual rates, he is told that money is tight, and that he cannot be accommodated. Then the banker gives the contractor the name of a man who, he says, may be able to help him. Off he goes and he gets the money all right, but before he is through he has paid 20 per cent for it. Why? Because the man named by the banker is a 'bonus man' working secretly in collusion with the banker. The 'bonus man' runs the expense up by charging for his services and for fees of various kinds, in addition to the legal interest. Does the banker know? Of course, he does. He is the instigator of the whole system, and shares in the extra profits made by beating the law in that way. *There are hundreds of bonus men operating in all the big cities.* You can find them in any business block. Don't blame the bonus man altogether. The money shark back of him is the fellow who deserves to be hit. Now, what happens? The poor contractor must charge more for the building, the landlord adds it to the rent, and in the end the tenant pays tribute to the money shark when he pays his rent.

"Let me tell you a little story," continued Feder. "One day a woman rushed into the office of the Hebrew Free Loan Society, flung down some jewelry, and begged us to let her have $100. We lent her the money,

(Concluded on page 13)

Causes and Cure of Business Depressions

Taxation of Production and Consumption and Non-taxation of Values Created by the Community the Principal Causes—the Road to Industrial Freedom

By HERBERT J. BROWNE

THERE are as definite causes of business depressions as there are of business booms. But they are not, as economists generally claim, swings of the pendulum. If they were the pendulum would swing equally in both directions. Business should always boom, for business is the supplying of human needs, and human needs are always outrunning the capacity of business to supply. Therefore business depression is unnatural and business activity the natural expression of human needs.

Has anyone ever seen a time when everyone had all the shoes he needed, all the clothes, all the food? When everyone was well housed, and the houses were all well furnished? No. No one has ever seen that wonderful day. Yet all have seen shoe factories close down because the demand for shoes had fallen off so much that accumulated stocks would supply the demand for a long time. Everyone has seen cloth mills and tailors idle from slackening of the demand for clothes; and lumber mills and brick yards and the whole range of the building industries dislocated from lack in the demand for houses and other buildings.

Catch up with human needs? Why, here are just two items in the long list of human needs in the United States alone: The railroads need the expenditure of ten billion dollars in electrification, in new equipment, in double tracking, in improvement of terminals, and in fitting the railroad systems to complement the vast new development of automobiles and auto trucking. There are one hundred thousand miles of highways the development of which into wide automobile roads is needed right now. Economically, farm produce is dragged uphill to the city consumer, and city production is dragged uphill to the country consumer. The economic hills need leveling.

Human needs satisfied? No, human needs are not and never will be fully satisfied. When material wants are met, and we can all—all—travel, see the world, the great natural wonders, and find time—time, not leisure—for broad education, then and not till then will man be able to grow into the image of his Maker.

What Causes Business Depressions?

BUT business depressions continue to come. In this country they used to be about 20 years apart; then 15, then 10, then seven. The country had one in 1907, another in 1914; it struck again in 1920-21. When will the next one come? Are the causes understood, not the *symptoms*, but the *causes?* If they are then the next depression may be forecasted. If the causes are removable, in time the world will become wise enough and unselfish enough to remove the causes, and then the natural law of steady and unbroken human activity will work to supply the constantly increasing requirements of human desires.

Now this is observable: *Certain interests, certain elements of the social organization escape the consequences of business depressions; there are some which even profit by them.*

The panic of 1857 was largely a bankers' panic due to the over-extension of credit in western land speculations, and an unsound system of state bank note issues. That of 1861 was due to the outbreak of the Civil War. The culmination of speculative railroad building and Wall Street finance brought on the panic of 1873. The depression of 1878 followed the contraction of the specie resumption period. In 1893 the country had a bankers' panic, largely artificial, involved in efforts to repeal the Sherman Act providing for the purchase and coinage of silver. The upheaval of 1907 was started by the gigantic struggle between Hill and Harriman for control of the Northern Pacific. The outbreak of the World War precipitated the depression of 1914, though the country had been moving into a business slough for several years. The industrial breakdown of 1921 will be discussed in detail further on.

The following tabulations are given to illustrate certain analyses, and attention is particularly directed to the fact that the national banks have in recent years largely escaped the effects of the depressions, especially since the passage of the Federal Reserve Banking Act:

TOTAL BUSINESS FAILURES—DOLLARS IN THOUSANDS

Year	Number	Liabilities	All Banks	Liabilities	National Banks	Liabilities
1857	4,932	$291,750				
1859	3,913	64,394				
1861	6,993	207,210				
1863	495	7,895				
1873	5,183	228,495				
1878	10,478	234,383				
1880	4,735	65 572				
1884	10,968	226,343				
1886	9,834	114,614				
1890	10,907	189,856				
1891	12,273	189,868				
1892	10,344	114,044				
1893	15,242	346,778	642	$210,998	161	$67,672
1899	9,337	90,879	55	26,116	10	17,706
1907	11,725	197,385	132	233,325	12	12,533
1908	15,690	222,315	180	123,126	31	48,388
1909	12,924	154,603	80	24,677	11	4,109
1913	15,632	250,802	120	31,546	7	5,197
1914	18,280	357,908	212	56,005	19	9,606
1915	22,156	302,286	133	37,223	18	13,649
1919	6,451	113,291	42	9,611	1	496
1921	19,652	627,401	330	96,124	28	17,301
1922	23,925	598,262	364	95,933	33	20,287

Intervening years of low figure failures are given to emphasize the extent of the business depressions in the bad years. In recent years it is plain that the national banks under the strict scrutiny of the Federal Reserve Board and the Controller of the Currency have become extremely conservative and reduced their failures to a minimum, though they handle an overwhelming proportion of the commercial paper of the country. *But that is also translatable into the discovery that in protecting themselves they have thrown into bankruptcy an increasing number of their depositor-borrowers.* The fundamental difficulty, then, lies deeper, and must be sought. Business failures in the United States far outnumber those in Great Britain, where more conservative methods are followed, and where the "shoestring" business gambling which has sprung up in the United States in the last 25 years is not tolerated.

Business failures as reported are confined to banks, commercial houses, wholesale, jobbing and retail, and to manufacturers. Mining companies in actual operation may get into the reports, though there is no uniform rule. Railroad receiverships, even though they may involve properties running into large millions and result in the wiping out of all the junior securities, are not included.

Still more striking, *no agency, not even the Federal Government in its painstaking census search for trivialties, has ever ventured to tabulate the foreclosures of mortgages on farms, homes and other forms of real estate.* Yet here are figures which in times of depression dwarf all other forms of business failures in numbers and volume many fold. Were recorded chattel mortgages included in the discovery of foreclosures, the totals would give the public a cross-section of economic conditions which the ruling powers are most anxious shall be kept under cover. (In one county in Colorado 6,000 foreclosure sales were advertised in March.)

One other important factor is also outside the knowledge of the people. The Federal Government has spent millions of dollars, years of time, with the services of hundreds, yes, thousands of the best experts and scientists available, to investigate and report on hundreds of subjects. It would take huge buildings to hold the libraries of printed matter which have resulted. Yet there is one subject that the government has never investigated, and every time the matter is brought to the attention of Treasury Department, Department of Commerce, any of the numerous bureaus of statistics, or to the attention of Congress itself, the body which lays all taxes and determines all appropriations, every one hunts for cover, the matter is hushed up, and nothing is ever done about it. This dangerous subject is *The Incidence of Taxation. Who pays the taxes?* Is it the individual who hands in the money, or is he merely a middleman with unlimited power to pass the tax on to someone else with a heavy commission for his part as intermediary? What is the effect of any particular tax? Does it stop with its payment, or does it keep on rolling up a snowball of hidden effects until it has affected many other articles than the one on which it was originally imposed and many other persons than the one who paid in the first instance?

Key Found in Correction of Tax Evils

INASMUCH as the people now pay more than four billion dollars a year to the Federal Government and about a billion more to the state, county and local governments, the questions here put, and correct answers to them, will have a definite value; for a clear understanding of the effect of taxes as now imposed or withheld will explain fully the causes of business depressions, foreclosures, failures and economic troubles generally.

If taxes returned to the public in productive benefits, the situation would simplify to some extent, but they seldom do. Let us examine in the light of reason and common sense a few taxes, and trace their effects. Every statement here made may be challenged, and yet the principal causes of economic depressions are involved, and the possibility of their removal lies in the correction of the evils of the present systems of taxation.

1. A tax on a bond, stock certificate, note, bank deposit, or mortgage is a tax on the mere paper evidence of title, the actual property being elsewhere and already taxed. So this class of taxes makes double taxation. The mortgagor pays the tax on the mortgage, for such tax is added to his rate of interest. This class of taxes is as unsound as would be the taxing of a deed to a house and then taxing the house.

2. A tax which rests on an individual directly, whether called a poll tax or by some other name cannot be shifted. The person has it to pay. Since the ability of individuals to pay varies with their income or their property, such a tax imposed equally on all persons is unjust to the poor and discriminates in favor of the well-to-do.

3. For the same reason taxes on food products weigh too heavily on the poor, who eat practically as much as the wealthy, and are thus disproportionately high. A poor man uses as much sugar as a rich man, yet the rich man may be worth thousands of times as much as the poor man. Therefore the tariff tax on sugar is an unjust tax. The same argument applies to all taxes on production which ends in articles of general consumption.

The tariff tax on sugar is paid by the importer. He adds it to the price of the sugar, and since it involved his advancing the money he adds a charge for that service. The refiner, wholesaler, jobber and retailer in turn pass that tax along, each adding a little to the original tax until the consumer finds that what was originally a tax of 1.83 cents basis of refined sugar from Cuban raw at 1.76 has become a tax of not less than 3.60 to 4 cents. So to get a revenue of perhaps $100,000,000 a year the government puts a charge of about $200,000,000 a year principally on the pockets of those least able to pay. The same principle applies to all taxes, whether tariff, internal revenue, or state and local, on all articles of food, wearing apparel, furniture, and so on.

4. Let us examine the whole line of general property taxes as applied to anything and everything which are products of human effort, whether that effort is direct and visible labor, directive labor, or that accumulated labor called capital. There is a tax on a sawmill; that is added into the cost and price of the lumber. The machinery in the sawmill was made in a machine shop which had been also taxed, and behind that still more machine shops with taxed implements, all rolling into the snowball of prices to be added to the cost of that lumber. The lumber finally arrives at the site of a new house, in company with bricks, lime, plaster, nails, plumbing, glass, and the whole range of fittings and material which enter into the making of a house. Now the house is built, and all those piled-up elements of previous taxation on the materials of the house and on the various processes of producing that material are added into the cost and therefore into the price of the house. They have all been transferred, "shifted" is the usual term, to the owner of the house or to the tenant who is to occupy it. But we have only begun. All these taxes which have been paid by the workmen who made that lumber and other material, on their food, clothing, the houses they live in, similarly rolled up, have formed an important element in their cost of living and forced them to seek increased wages, and, as has been amply evidenced the past few years, to secure them. Now the house is finished, and along comes the assessor and tax collector, and imposes a tax on that house with all its costs increased by this endless tangle of multiple taxation, which final tax includes in its valuation the increased price due to all the previous taxes. Yet the builder of the house has performed a public service. He has not only furnished a shelter to a family, but he has employed labor and sent the ramifications of activity and employment clear back to the remotest element of capital, labor and production which entered into the material of the house. For which beneficent act his house through its user is to be fined annually as long as it stands.

Why Low Taxes on Mineral Properties?

IT IS estimated that the "snowball" elements of multiple taxation, as here in part illustrated, add 25 per cent to the cost of living. They never stop. They recur endlessly. Anyone can spend an instructive day in taking up any single line of production and trying to follow the tax clew back through all its ramifications.

5. Now, take another class of property, the anthracite coal fields of Pennsylvania. They underlie some 360,000 acres of surface, are less than one-tenth developed, the rest in the condition in which the Almighty laid them down a million or more years ago. They are taxed at the rate of wild land usually, and are worth from $20,000 to $150,000 an acre. Four railroad corporations and a few private concerns and estates, all closely affiliated, own this entire deposit. During the World War while the Federal Government was taking pennies from children for soda water, the anthracite coal fields of Pennsylvania doubled in value from six billions to twelve billions of dollars, and that vast increment of wealth contributed not one cent to the nation in its hour of need.

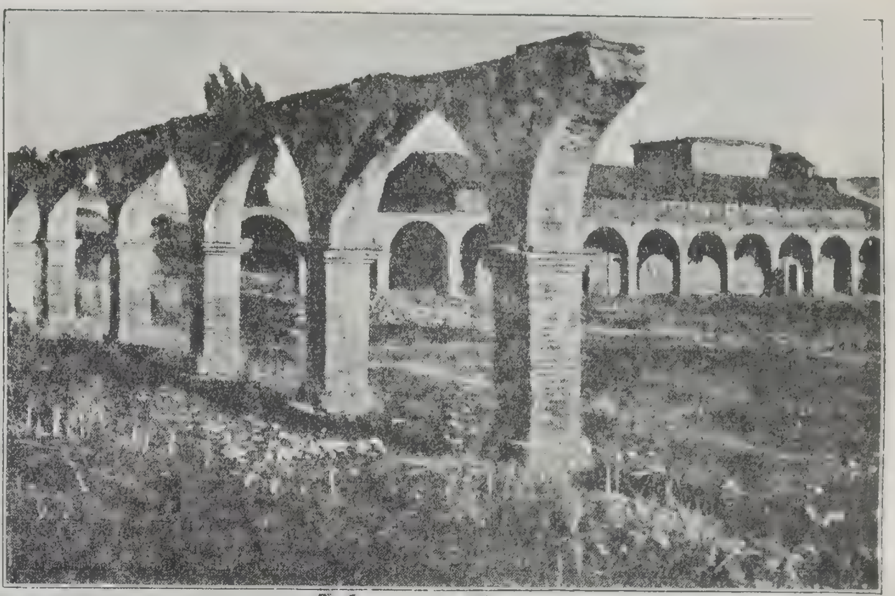
The Constitution restricts the power of the Federal Government in imposing direct taxation to those made proportionate to the populations of the several states, but the war powers of the executive under the Constitution have never been fully defined by the Supreme Court. They might prove wide enough to cover a tax on the anthracite coal fields. The writer has put a good quality of anthracite coal in his cellar in Washington, D. C., for $4.25 a ton. The present retail price is around $16 a ton. It is obvious that the increased value of the anthracite coal fields is due to the ability of the owners thereof to make the public pay increased prices. Now were the Federal Government to do what the Mexican Government has done, and *extend its sovereignty and power of taxation over all mineral properties,* a tax of a dollar on the hundred of the value of the anthracite coal fields, which is far less than the average farm and home owner pays on his property, would produce a revenue of $120,000,000 a year, and would so stimulate the owners of that area that they would produce more coal and thus bring down the price. If the dollar rate did not do it, a $2 one might be tried. Let it be remembered that the anthracite field owners have not given the American people any increase in coal shipments in 10 years, although the urban population, which is the principal

(Concluded on page 14)

Indians Restore Missions Forefathers Built

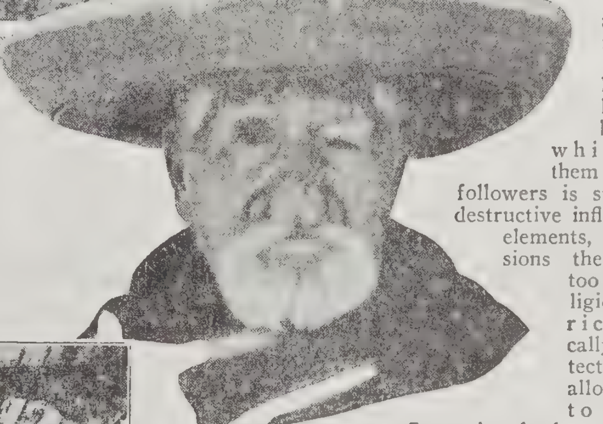
California Missions in Stone, Clay and Plaster, Serve as Signposts of Early Progress of Civilization

By HARRRY H. DUNN



One of the ruined arcades of the Mission San Juan Capistrano, now being restored. In the background, the long-roofed building is the famous church of Father Serra, founder of the Missions, who built it in 1776.

Above—Mission San Juan Capistrano, with the priests' garden in the foreground. This is the first of the chain of 22 Missions in California to be restored to its original appearance by the work of the descendants of the Indians who built the original edifices. Here Padre Junipero Serra planned all the rest of the Missions and laid out El Camino Real—"The King's Highway"—connecting them.



Right—Acu, hereditary bell-ringer of the Mission San Juan Capistrano, the only Acagcheme Indian remaining at the Mission, who is directing the Indians of other tribes in the methods of construction of the Mission buildings. He was once captain of the sheep-shearers, and played the flute in the Indian choir more than 70 years ago. His Spanish name is Jose de Gracia Cruz.

AFTER modern man, organized in clubs and associations and even in state and city governments, has tried in vain to accomplish the restoration and preservation of a chain of more than a score of the most important historical monuments in the New World, brown-skinned Indians, descendants of those other primitive people who erected these landmarks, are putting the structures back in the same condition in which they were more than 150 years ago, and giving to the United States probably the most valuable set of stone and clay and plaster records in the Americas.

The buildings are the California Missions, 22 in number, ranging along El Camino Real—"The King's Highway"—from the southwestern corner of that state to a point nearly 100 miles north of San Francisco Bay. Every effort has been made by those interested in their preservation, including the church, the state, a number of cities, the Landmarks Club and several other organizations, to have these buildings restored, and to have them kept as signposts of the early progress of civilization. All failed, and the Missions, since their secularization, in 1833, by the government of Mexico, have been crumbling except in one or two instances, such as the Santa Barbara Mission and the one at Los Angeles, which have attracted so much attention from tourists that the priests in charge have been able, from donations, to keep their beloved buildings in fair repair.

Now, however, comes Father St. John O'Sullivan, a young and enthusiastic successor to the padres who tramped the bare brown hills of California more than a century ago, with a plan which is resulting in the rapid restoration of the Mission San Juan Capistrano—"the Gem of the Missions"—of which he is in charge, and which will be extended to the other Missions until all have been reconstructed to the same size and condition they possessed when they were first completed and dedicated to the service of God on the Pacific shores. Father O'Sullivan has simply gathered together all the Indians who still live within the scope of influence of his Mission, and talked to them until they have seen, as he sees, the necessity of restoring and preserving the buildings in which their forefathers were given their first glimpse of a Christian world. Then, with the plans drawn by Padre Junipero Serra, founder of the Missions, before him, and with these Indians as his workmen, Father O'Sullivan has proceeded to rebuild the Mission, exactly as it was first built, not as modern architects would build it.

The walls rise again from adobe bricks, of the same size and color and manner of making as those from which the Indians of 1776 built the Mission. Binding the walls is cement, made by hand from lime hauled from the surrounding hills. Supporting the roofs are huge hand-hewn timbers, cut with ax and adze slowly and carefully and to the exact size, just as they were cut under Father Serra's direction. The roofs are laid of handmade tile, the clay colored a brilliant red before it is molded into the half-tubes which resemble so closely those of 150 years ago that, except for the moss on the latter, one could not distinguish them. Over the walls is laid a homemade plaster, put on, not with trowel or mortar board, but with that odd, flat, triangular stone, which the Indians called "takkish."

It is the idea of Father O'Sullivan that the Missions should be "restored," not "reconstructed"; that they should stand once more exactly as they stood when built, of exactly the same materials, on the same plans, to the same size, and of the same architecture. In his own Mission, he is even restoring an altar, brought from Spain in 1806 or 1807, and then nearly 200 years old, which he found in a warehouse, where it had lain for nearly a century. At this altar, when the Mission San Juan Capistrano once more appears as it did in 1876, this enthusiastic priest will call his congregation together and hold his services, on the identical spot, and before the same altar at which Junipero Serra worshiped and said mass.

Rear, or choir, end of Father Serra's church, before the work of restoration began. The altar, parts of which are shown at the left, is about 300 years old, and was shipped from Spain in 1806 or 1807 to the Mission San Juan Capistrano, where it is to be used again, when restoration of the Mission has been completed.

The other day I had the pleasure of walking with Father O'Sullivan, beneath the leaning arches of San Juan Capistrano. We watched the Indians, led by old Acu, last of the Acagchemes, and now hereditary bell-ringer of the Mission, working on the adobe bricks, or molding the rounded red tile, and the young Irishman, retreading the paths of the Spanish Franciscans who preceded him by a century and a half, told me something of his ideals and his plans:

"The Missions are in ruins; the Indians are no more; the pious padres have gone to their rewards. The world which loves the flesh and the pride of life says that the work of the Fathers was a failure. But in a sense which the world does not and cannot understand, the things they wrought will one day rise like a glorious sun over the ocean of eternity, while the work of the worldling, which is now so proudly held up for the admiration of his fellow men, will sink and disappear, like the sorry wreck of a ship, pounded to pieces on the treacherous rocks of time.

"Though the work of these padres in the hearts and minds of men is permanent, the labor of their hands in the buildings which housed them and their followers is subject to the destructive influences of the elements, yet the Missions themselves are too valuable religiously, historically, artistically and architecturally, to be allowed to sink to dissolution. So, going back to the methods by which the Acagcheme Indians, who lived in the rancherias surrounding this Mission, worked under direction of Father Junipero Serra, from 1760 to 1800, I am restoring this Mission, and am taking up with the priests in charge of the other Missions, the restoration of each of them by similar methods."

The cost of restoring a Mission depends largely on the amount of damage done to it by the Mexican authorities when they took the Missions away from the church back in 1833. At Capistrano the cost is $8,500.

The walls are being rebuilt four feet in thickness, that is to say, four adobe bricks wide, just as the remaining standing walls of the Mission, and of the other 21 Missions, are built. When this church has been completely restored and the present north wall across the church, placed there since 1867, shall have been removed, Mission services will be held there once more, just as they were held long ago.

Many interesting discoveries have been made by Father O'Sullivan since he commenced this labor of love in restoring "the Gem of the Missions." Here are preserved the records of San Juan Capistrano, as well as the dates of the founding and completion of the other Missions. Among other things shown by these records are that three padres had been buried under the sanctuary of Father Serra's church. The records are not clear as to the exact location of the tombs of Fathers Varona and Fuster, and, to be historically correct, establish burial and locate the graves before restoration work hid them, Father O'Sullivan, wielding the spade in his own hands, started exploratory excavations which carried him virtually throughout the entire ground area of the church. Work, however, is only one of the things of which Father O'Sullivan is not afraid, and he found all three graves, and identified each. Beyond the Mission itself he went exploring, and, stored in an old warehouse, he found one of the finest altars, probably the finest, in the New World, brought to this Mission in 1806 or 1807 and used until the secularization order when it was hidden away, in 1833, by some faithful son of the Mission. The altar is of mahogany and rosewood, carved in Mexico, shipped to Spain and there inlaid with gold and silver leaf and further ornamented, and then returned to the Mission San Juan Capistrano. This is the altar which is to be used again for services.

Market Prices by Radio Aid Farmers, Inquiry Shows

Hundreds of Letters Demand Continuance of United States Service

J. C. GILBERT, in charge of Radio Market News Service of the Bureau of Agricultural Economics, United States Department of Agriculture, sending crop and market reports from his office to Arlington, by ordinary telephone, where N A A transmits these reports both by radio telephone and telegraph.

By S. R. WINTERS

"WE 'HILL-BILLIES' out in the 'sticks' look upon radio as a blessing direct from God. We farmers are 'going broke' anyway, but we would like to have our radio to 'sorter' ease the pain."

A tiller of the soil—C. C. Windsor, by name—in a hand-written letter, rich in homely expressions, savoring of the sod, thus picturesquely suggests the benefits of the radio telephone to the countryside. He lives on a farm 100 miles northwest of St. Louis, Missouri, and 15 miles removed from any railway station. "Six months out of 12," he writes, "we consider a trip to the railroad station a 16-hour job—get up at 4 a. m. and get home around 8 p. m.—ourselves and teams worn to a frazed-edge."

If any one doubts the isolation of rural life, and the possibilities of radio telephony, with its entertaining, educational, and religious services, to bring the farm nearer the bustling city, the letter of this Missouri farmer should dispel such a misconception. And, although somebody has said that the highway that courses by your door is the road that leads to the end of the world, the dirt forming the pathway that links the home of this rural dweller in Missouri is frequently a barrier to the outside world. "We have not had a service in our church since August, 1921," he writes. "Our four boys and two girls have to walk to school through mud and rain, and probably 'coon' a log to get across the creek when it is full." C. C. Windsor, of Mineola, in the 'Show-Me' State, who penned the foregoing expressive sentences, owns a crystal-detector radio-receiving set, and isolation, impassable roads, a church without services, freshets, and even floods, are not conditions barring his contact with civilization beyond his own doorsteps.

This letter, as well as 596 others from farmers, grain dealers, operators of mills and elevators, and country bankers, was prompted by a "feeler" sent broadcast by the Radio Market News Service of the Bureau of Agricultural Economics, United States Department of Agriculture. J. C. Gilbert, specialist in market extension, requested the 86 wireless stations that are disseminating crop and market reports to include in their broadcasting programs for a period of one week the following paragraph:

"If you are interested in these market reports Uncle Sam wants to know about it. Write direct to the Radio News Service, Bureau of Agricultural Economics, United States Department of Agriculture, Washington, D. C., and tell them the use you make of the reports. Also make suggestions regarding the Market News Service if you have any—write today. The future of market reports by radio depends upon your interest in them."

The replies, nearly 600, all told, strange to say, largely had their sources in four states—Illinois, Missouri, Iowa and Nebraska. Forty per cent of the answers originated with farmers, and from 20 to 25 per cent of the replies to this formal inquiry were received from grain dealers, mills and elevators. Banks, co-operative organizations, radio companies, farm bureaus, high schools, farm granges, dairy companies, telephone companies, miscellaneous shippers, doctors and preachers, were among the enterprises scatteringly represented in this symposium of information and comment on the value of disseminating reports of market conditions by radio telegraphy and telephony. Since these four states in the Middle West are the seed-beds of grains and the feeding and tramping grounds of live stock, quite naturally, the major portion of the replies specifically mentioned grain and live stock as the two commodities in which continued "rapid-fire" information was desired by means of radio.

It is disappointing from the standpoint of this, the first nation-wide survey of making inquiry into the extent and practical uses of agricultural information (primarily market reports, borne on the medium of electromagnetic waves) that the expressed interests should be concentrated in four states. Yet, it may be said that these are located in a region where progressive tendencies are usually first intrenched. Was it not the Corn Belt section or the middle western states that first adopted modern agricultural machinery? Similarly, is it not to be expected that the radio telephone, a new invention as its services apply to rural life, should originally establish itself in an agricultural region where other far-reaching modern farm conveniences were early implanted? Or, possibly crop and market reports, at this time, are of more tangible value to grain and live stock producers in the Middle West than a similar service elsewhere; in the South, for instance, where cotton is the major crop.

Irrelevant these speculations doubtless may be, compared to the significance attached to the analysis made possible by the replies prompted by the inquiry that would determine the extent and use to which market reports by radio are being applied. It is the first survey of its kind, and the data thus realized may be appraised as faithfully reflecting the uses and benefits of the radio telephone in mills, grain elevators, banks, and on farms. Much generalization with respect to the magic of radio in dissipating the isolation of the countryside has been indulged, but the inquiry of Mr. Gilbert has unfolded numerous specific instances where the radio telephone is serving the needs of a country-minded citizenry. An examination of these letters, on file in Washington, affords a "close-up" view of farmers, grain dealers and country merchants "listening-in" upon their wireless receiving sets for the offerings of the ether. For that reason, this writer perused nearly 600 letters, many of them extremely brief, to be sure, that the readers of this magazine might have an insight into the symposium of views and comments of rural folk with their head-telephones clamped on their eardrums. The variety of comments alone challenges interest:

"The above service (referring to the Radio Market News Service) is of more value to farmers than newspapers, telegraph or telephone. In fact, it is one of the very few things the government has done that is of benefit to the farmer," is the interesting, though extravagant, claim of William L. Ewing, who lives on a rural free delivery out from Vincennes, Indiana.

"Now for the love of Mike don't stop it," thus speaks William H. Bohanan, of Benton County, Indiana. He, of course, is not referring to his favorite country newspaper, but market reports that come to him by means of a wireless receiving outfit.

R. L. Eyman, county agricultural agent at Jerseyville, Illinois, indicates that 500 farmers make direct use of radio facilities at this point. He is of the opinion that farmers in general in Jersey County are being benefited by this service.

The Mount Vernon High School, located at Mount Vernon, Indiana, is receiving agricultural information by wireless telephone and utilizing it in its vocational agricultural class. Graphs, indicating the trends of conditions in big markets, are posted and pupils are thus better enabled to learn farm economics.

"It seems to me that there should be no doubt about such useful service being continued, especially when some stations seem to be in the air at their pleasure with chimes, concerts, 'jazz,' music and chiropractic lectures—of so little importance to the public, compared to many other things." Thus writes J. R. Witzigman, cashier of the Miles Savings Bank, of Miles, Iowa, who obviously stresses the utility value of the radio telephone in preference to its entertaining possibilities.

M. H. Calderwood, another banking official in Iowa, located at Eddridge, in praiseworthy terms, says: "This is probably the greatest thing for the farmers that has been thought of in many years." The Farmers' Bank, of Stephens, Missouri, has installed a wireless receiving set "for the purpose of receiving the live stock market reports and weather forecast daily and posting them in our bank lobby for the benefit of the public." Another bit of testimony indicative of the tendency of a coalition between the country bank and the radio telephone is afforded by the example of the Caldwell County Trust Company, of Kingston, Missouri, to wit: "It is a great service and the best that we have had of getting prices, especially on the live stock market and grain market."

Eggs and poultry may be exchanged in the market-places on the strength of information "picked" out of the ether. Lefmann and Sons, of Washington, Missouri, indicated that market reports of this character are of particular interest to them. A similar but more elaborate expression comes from A. C. Holfner, of New Melle, in the "Show-Me" State: "By waiting for the daily paper to bring us the market quotations, we are exactly 25 hours behind, as the market is set in St. Louis at 11:30 a. m., printed in the evening paper, which, in turn, reaches us by mail at 1 p. m. the following day; whereas we get the radio market from the *Post-Dispatch* at St. Louis at 12:40 or one hour and 20 minutes after the market is set for the next 24 hours." This egg and poultry dealer resides in an inland town, eight miles from the nearest railroad.

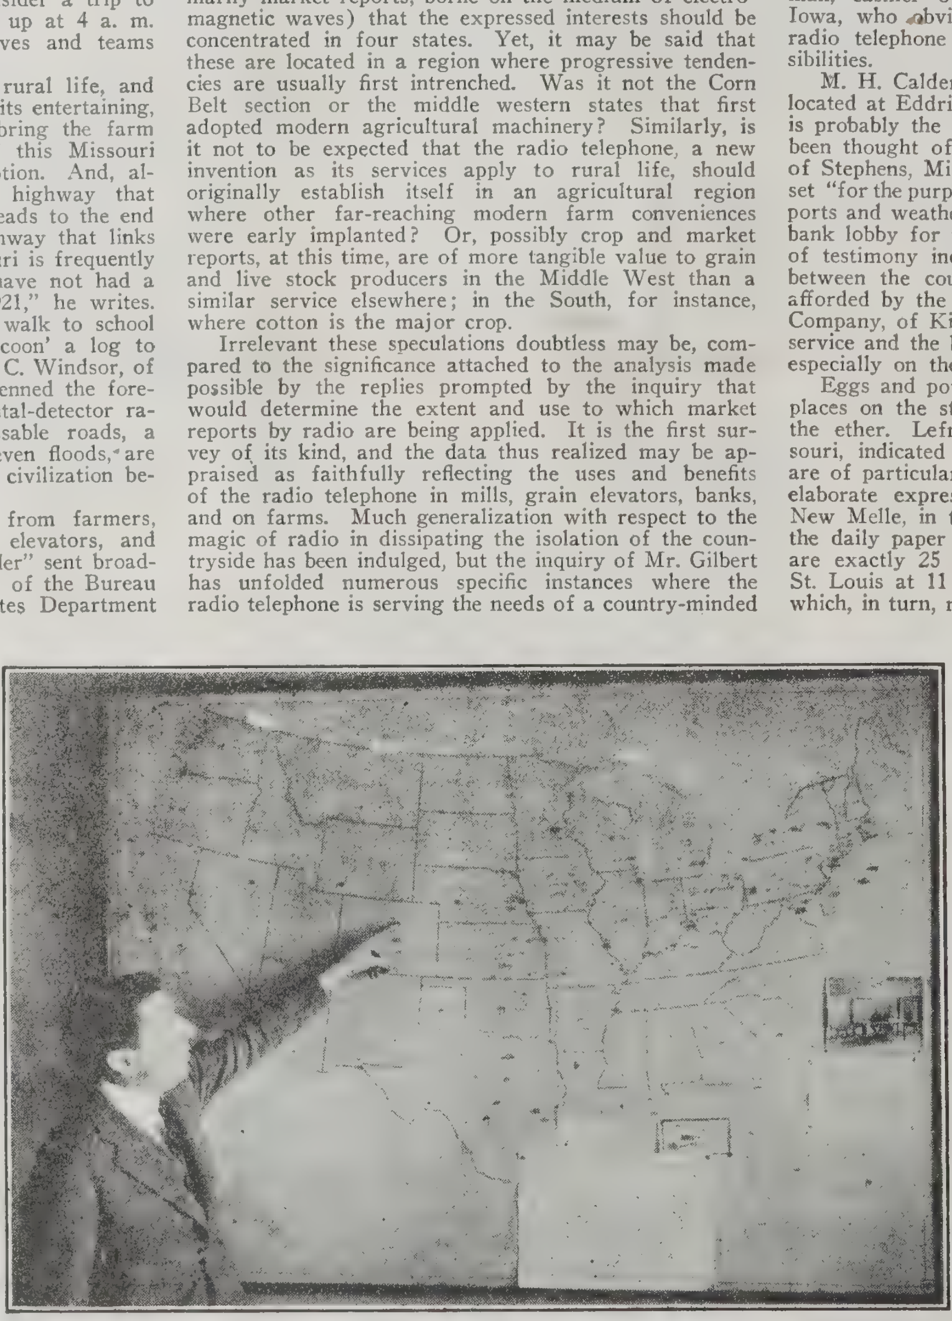
The butcher, the baker and the candlestick-maker may be interested in wireless telephony, as witnessed by a band agency located in the village of a middle western state, which has installed a wireless receiving set for the purpose of distributing market reports to butchers and merchants. This information is posted on a spacious blackboard located in a bank.

How one radio-receiving outfit can benefit hundreds of farmers, congregating around the crossroads' store or other assembling points, is suggested by the following letter from Coulon and Mayor, Labarpe, Illinois: "We get our markets exclusively through the radio service now, and every week sees hundreds of farmers getting the same benefits through us; and, also, some of them through their own machines which are becoming quite numerous."

All told, 133 mills, elevators and grain dealers, responding to the government inquiry, expressed interest in and indicated the value of the radio telephone.

"Our buying and selling are governed largely, if not wholly, by these reports," asserts E. L. Moore, a grain and feed buyer of La Cygne, Kansas. C. L.

(Concluded on page 14)



Mr. Gilbert indicating by a pin-perforated map that crop and market reports by radio cover every state east of the Rocky Mountains and the Pacific Coast states.

How Should Newspapers Treat 'Crime News'?

A Law Professor Handles the Question Fearlessly: News of Penalty Is News Also; He Cites Cases

By MRS. L. M. CRAMER

ONE of the most frequent criticisms made of the newspaper is that it devotes too much space to reports of crimes committed, and that in so doing it but serves as a textbook in crime for the potential criminal.

Professor John B. Waite, professor of law in the law school of the University of Michigan, an acknowledged authority on criminal law, has but little patience with such criticism. He contends that in the long run the public does not suffer through knowledge of the truth—provided it gets all the truth. He would not curtail the publication of crimes in the public press. Instead he would increase the amount of space devoted to crimes—increase it to include a full and comprehensive report of the punishment meted out to those who had committed the crimes.

"News of the crime itself is usually front-page stuff, but news of the punishment imposed for conviction of the criminal is just as usually back-page stuff, tucked away in a few lines in some remote corner of the paper where, if it is seen at all, it is by the merest chance," Professor Waite pointed out, in discussing the question of a newspaper's responsibility in printing crime. "Punishment for crime is utterly and absolutely useless unless such punishment gets publicity, and only the press can give it publicity. To the extent that the press fails in that obligation, to that extent the press is responsible for the contempt of law and the crime for which this country is notorious among nations."

The More News the Better—If Complete

FRANKLY admitting that he has no particular interest in the complaint that newspapers serve as textbooks for potential criminals, Professor Waite said that perhaps, through the publication of crime details, and the frequent exposure of faults of procedure, certain instruction in ways and means are given to impressionable minds, "but that is inevitable so long as crime and its methods exist as facts," he declared, and then he added: "To my mind newspapers publish not too much fact, but too little. In the long run the public cannot suffer through knowledge of the truth, if they get the whole truth and nothing else. To deny the value to the people of facts and all the facts, is to slander the whole idea of Democracy. It is never knowledge, but ignorance, that leads to blundering public action, and perpetuates the evils of popular government and misguided personal action.

"They who urge censorship of the news on the ground of political expediency suggest incapacity on the part of the people. In wanting to feed the public only such facts as censors in an assumption of self-superiority may think the public fit to receive, they appear to me to be the transmigrated priesthood who maliciously, or in misguided good faith, kept the truths of life from the people in the interest of their own bigotry or gain.

"Possibly I am myself a fanatic in the enthusiasm of my belief that we Americans, as a people, are capable of guiding our actions better and more wisely than any intellectual oligarchy can indirectly guide them for us, and so I suggest that not less news of crimes be printed but more. To print the results, to the criminal, of the crimes he has been convicted of committing, to let the public know what the punishment has been for these misdeeds, is backing up the efforts of administering justice."

Is Public Penalty a Deterrent?

PROFESSOR WAITE called attention to the fact that originally punishment grew out of the desire for vengeance by the person injured. It was imposed by the state mainly out of desire to keep the peace by regulating it and limiting its scope. Punishment cannot be abolished, he pointed out, without leading to an outbreak of illegitimate vengeance. He called attention to the Russian Czars Vlodimer I and II, who tried to abolish the death penalty, with the result, in each instance, of a widespread development of private feud and reprisal murders. "Even today any general failure in administering criminal justice would inevitably produce Lynch law or 'vigilante' action," he said, and recalled that only a few months ago a judge upon the bench referred to punishment for crime as the "righting of a past wrong; the avenging of the oppressed."

"But granting this as its origin, modern ideas of public good have invested punishment with a different, an additional and more important purpose; namely that of deterrence," said Professor Waite. "To some extent it has in view deterrence of the individual punished, himself. This is a social spanking of a naughty child. The earlier English punishment, when actually inflicted, was very efficacious in this respect. The punishment, even for first offenders in more than 150 crimes, was death. In the main, however, the purpose is deterrence of others. The idea is so to spank Tom for his misdeeds that Dick and Harry will stay on their good behavior to avoid a similar spanking.

"It is sometimes asserted that the whole theory of deterring one by the punishment of another is fallacious; that it does not in fact deter. I have heard of an early English statute, though I have been unable to locate it, occasionally cited in proof of its futility. That act declared, in effect, that pickpockets caught plying their nefarious trade among the people assembled to witness the hanging of a pickpocket, should not only be hanged but should be additionally punished. On its face such a statute exposes its own futility. It condemns, apparently, even hanging as a deterrent, hanging not merely heard of in ribald gossip, but hanging actually witnessed. Gallows meat seems to have fattened under the shadow of the gallows itself as unconcernedly as do cattle in the stockyard pens.

JOHN B. WAITE,

Professor of Law at the University of Michigan, and an authority on criminal law.

"But potential criminals don't always ignore possible punishment, they merely count on the improbability of receiving any. English executions failed because only a small number of actual criminals were caught and few of those caught were executed. The fear of punishment was, and is, divided by the chances of escaping it, and the quotient resulting is distinctly small as a deterrent."

Where Newspapers Mislead People

PROFESSOR WAITE called attention to a punishment that will in fact deter, as illustrated by an authentic experience of South Carolina before whipping was abolished. Bands of thieves that operated widely from New Orleans to Baltimore, left South Carolina undisturbed. He recalled that the explanation given by the thieves themselves, when they were subsequently caught, was, "They whip men for stealing in South Carolina and that is something no gentlemen will submit to." And once he quoted from Solomon, "Because sentence against an evil work is not executed speedily, therefore the heart of the sons of men is fully set in them to do evil."

"You may well be asking in what way newspapers are to blame for this failure of criminal justice wherefore men count on escape rather than on punishment," said Professor Waite. "As a matter of fact I am not crediting the failure to newspapers. It is due to the defects in the human element and to the ignorance or the incapacity or the unscrupulousness or the self-seeking of some of the men who sit on our judicial benches and serve on our juries. In a sense the newspapers are to blame. According to the report of the Cleveland *Survey*, the judge who works long hours studying his cases and who renders prompt, intelligent judgments never gets his name before the public in the daily news. *But the mutton-head or the clever politician is advertised by the papers because it is considered news that he eats candy during a trial and says it strengthens his nerves.*

"Judge Stevens' spectacular punishments of bootleggers were printed in capitals, but his later quiet remission of these punishments was ignored by the papers. In this way the papers do help to perpetuate the defective element in the administration of criminal justice.

"Where the press more directly fails to back up the efforts of justice is a simpler matter. Not all crime goes unpunished. A surprisingly large proportion of criminals are caught. Although there is delay and inefficiency in the trial of them, a much larger proportion of them are ultimately punished than the layman is wont to believe. When one divides the punishment by the chance of escape he usually gets his supposed knowledge of the chances of escape from the newspapers, and when he gets so small a per cent of danger to the criminal it is because his figures for the chance of escape are inaccurate and usually much too large.

Take the Toledo Robbery for Example

"THE press does, as far as I am aware, give publicity to every crime committed. But it does not—of that I am sure—it does not give publicity to every punishment imposed for conviction of crime. And, more particularly, news of the crime is usually front-page stuff, while news of the punishment, when it is reported at all, is back-corner stuff and is related in an infinitely lower tone.

"For instance, the post office robbery at Toledo a year or so ago was a spectacular affair which drew scareheads from all the near-by papers. A number of men and women were concerned in it and securities of immense value were taken. The papers went at length into all details, the planning which had preceded it and the methods by which it was carried out. I, like the rest of the world, should be disappointed if papers ceased to give such facts.

"But I wonder how many people, who read all about the robbery, now know that the government has recovered most of the loot and that, caught and tried singly and in groups, most of the actors in the crime are lock-stepping the cold corridors of Leavenworth penitentiary? You and I may know it because we happen to be interested in Toledo and its affairs and from back page and middle page we have picked up and remembered the casual announcement that one after another had been caught and, later, had been convicted. Knowing vaguely from the papers that several had been caught I recently looked up the records. I was astonished to find that 25 men and women had been not only arrested, but tried. Of these 25, there were 21 found guilty and sentenced. Two were given life sentences and three others terms that were practically for life. Exclusive of the life-termers, the total of sentences was more than 184 years.

Some Figures on Space Given to Crime

"THAT, I think, was a crime that most distinctly did not pay anybody.

"But I wonder how many casual readers of the papers have any idea of these facts. Most readers without doubt believe that there at least, in view of the huge sum stolen, was a profitable transaction; a successful crime that netted enough to put every actor in it on "Easy street" for the rest of his life. Inquiry among my acquaintances who read of the crime shows that none knows that it put the actors in the penitentiary.

"Cannot the final slam of the prison door and the dreary prison years be invested with the morbid news interest, if properly written up, that a now commonplace holdup possesses? The pallid convict would have a greater novelty in news than the highwayman, I think.

"We know for a fact that newspapers can and do give special publicity to certain subjects when they choose to do so. For example, during the first half of January, 1919, the Cleveland papers gave about 900 inches of space to crime. During the last half of that month they gave 6,600 inches to crime. Crime itself, however, had only increased from 345 to 362.

"The whole matter, then, resolves itself into this: Punishment for crime is utterly and absolutely useless unless such punishment gets publicity. And only the press can give it publicity. To the extent that the press fails in that obligation, to that extent the press is responsible for the contempt of law and the crime for which this country is notorious among nations.

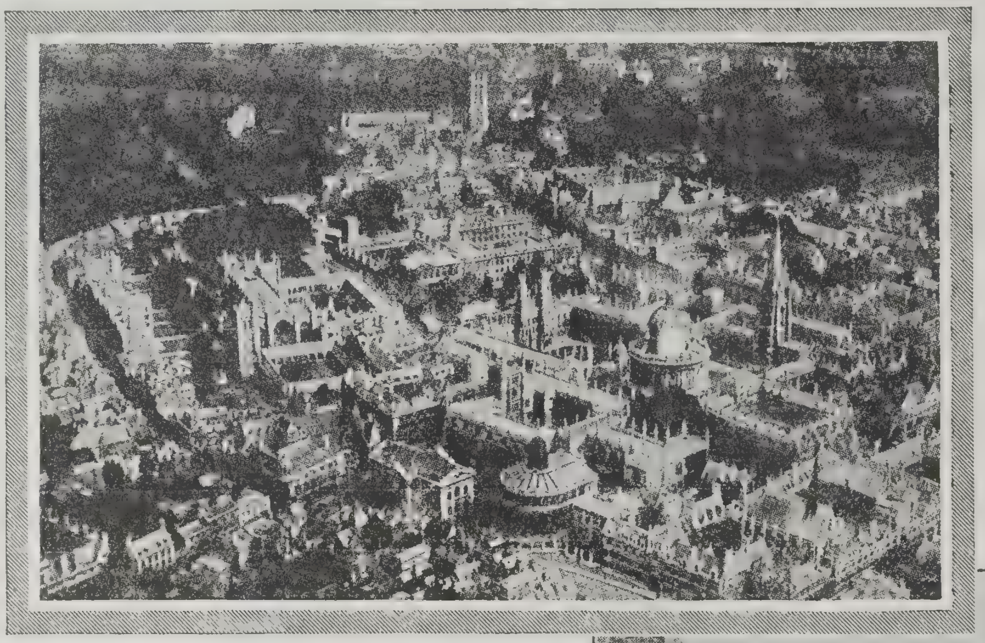
"But to the extent that the press will feature punishment as well as crime, to that extent the press will give force to deterrence and will create a new respect for law and a surprising decrease in crime."

Social Life Oxford's Most Important Factor

Tutorial System of English University Life Does Away With Formality Which Often Frightens

By CHARLES R. BAGLEY

OF ALL the factors that contribute to a student's education in Oxford, the social life is undoubtedly the most important as well as the most attractive. The entire university system is based on the principle that contact with intelligent men brings both knowledge and inspiration, and the method adopted is that of wide inter-associations of students and professors. Oxford seeks to educate rather than instruct; that is, the student is encouraged to develop slowly and carefully his own personality rather than forced to accept predigested materials and readymade opinions from books and instructors. An old don (professor) once explained the system very well in the following statement: "We bring them here, put them in contact with good books, intelligent companions, and established traditions; and then let them educate themselves." This explains why the social side of the university life is so highly developed. It appears in the method of instruction, in the club meetings, and in the sports, as well as in the social life proper.



Oxford, from the air.

Such a statement without explanation might lead one to believe that Oxford is merely a winter resort, where the students go to spend the session amid pleasant social surroundings. My friends have often inquired: "But please tell me when do you work! Every time I hear from you, you are either having one continuous round of engagements at Oxford or else running around the Continent with a party of friends." Naturally, it is perplexing to an outsider. How is one going to reconcile the conflicting idea of work as reflected in the Oxford standard with the idea of recreation as seen in the extensive social life of the university? In reality, the answer is as simple for one who has experienced the life as it is difficult for those unfamiliar with English ideas of education. Here it is in a word. The social life at Oxford, as evidenced by the fact that it runs over into all phases of university activities, is primarily an attitude, a means to an end. The few students who fail to understand this early in their course become painfully aware of the fact on the day of final reckoning. Most of one's actual book work is done during the vacations, which last for six weeks at Christmas, six weeks at Easter, and for sixteen weeks during the summer. Even those events which might be classed as purely social are not designed merely for the purpose of just having a good time but also for the purpose of making new acquaintances and friends and of nourishing those friendships already formed. If I were to explain it in terms of the don's definition quoted above, I should say that the students find that the best way to educate themselves is to keep in close touch with the professors and with the other students of the university, not by a mere official relationship but by an informal friendliness which leads to friendly discussions, an exchange of opinions, and often to a mutual inspiration.

Stephen Leacock, in "My Discovery of England," humorously describes the Oxford tutorial system as being nothing more than a pastime in which the tutor invites the pupil to his rooms after dinner and "smokes at him" for an hour or so once a week. As a matter of fact, the tutor does "smoke at" his students during the tutorial hour. Naturally he does other things besides smoke at them, but we are not primarily interested just here in the instruction itself. I have often had my tutor drink at me as well when I was taking lunch or dinner in his home. Some of my tutors have had me drink at them, too, when they came to my rooms for tea. Several times during the year, particularly on Guy Fawkes night, students and tutors both smoke and drink at each other.

This attitude of the tutor toward pupil during lectures and tutorials and his decidedly friendly attitude outside of the classroom does away with the formality which often frightens the pupil into a fruitless silence, where he accepts submissively whatever is handed out, not daring to ask why or how it came to be so. The tutor and pupil get together. In my own case, I remember distinctly that by the end of the second week my tutor had informally and quietly, but nevertheless thoroughly, taken a complete inventory of my vacant mind. All restraint was broken down by his apparent interest and by the way he met me on terms of equality. We talked together and discussed our problems as man to man, problems which came up in the essay or problems which arose from university conditions or from the day's news. In this way a skillful tutor can draw out of a student all that the latter is capable of doing. Good students flourish under this system; poor ones get what they are capable of assimilating; while lazy students die off from want of attention. As soon as I found out that my tutor had sounded the depths of my ignorance and that there was no further use of my denying the fact I started in to do some real work. Far be it from me to defend the Oxford system of social education on the grounds that it made a student out of me. That could be proved only with great difficulty. Still I shudder to think of how much further I might have fallen short had it not been for the three years I spent there.

Corpus Christi College and Merton tower.

The River during Eights' Week.

The freedom of relations between tutor and pupil is well exemplified by what happened at my own college one night during a celebration. One particular tutor was having such a gay time with one of his pupils that he forgot about the passing time. About 1 a. m. he suddenly realized that he had kept the pupil overtime and that the latter, returning to college after midnight, would be reported by the gatekeeper and heavily fined if not expelled. Despite the pupil's protests that he didn't want to go back to college, the don took him there and pushed him inside through a private entrance, for which he had a key. As a result, the poor student, who really lived out in town, was forced to climb back over the high wall and managed finally to reach his own rooms about 3 a. m.

It is in the clubs that social life reaches its highest point. On entering Oxford I was appalled at the number of clubs meeting each week; there must be at least 25 important clubs and societies which hold weekly meetings. There are clubs for every race, idea and creed; language clubs, literary clubs, musical societies, art societies, political clubs, labor clubs, cosmopolitan clubs, debating clubs, dramatic clubs, Indian clubs, and socialist circles. Most of the larger clubs have rooms of their own where meetings are held on a certain night of each week and where members and friends may gather informally at any time to discuss affairs of every sort. Some of the clubs serve meals; practically all of them have reading and writing rooms stocked with magazines and daily papers, where one can attend to one's correspondence or meet friends for tea or coffee. The programs in the majority of the clubs alternate between debates among members and addresses by noted visitors. Heckling is carried on good-naturedly but very consistently, regardless of persons or circumstances; so that a student who has served any big club efficiently as president for a term may rightfully claim some ability as a governor of restless subjects. Dr. George Vincent, after listening to the minutes of the previous meeting at the American Club, laughingly and wittily accused us of inviting speakers there, not for the pleasure of listening to their talks, but to have some object for criticism in the minutes of the following week. All debates are thrown open to the house, and at the close the entire assembly votes on the question. No one cares a snap about oratory, and every member votes according to his own personal opinion about the question at issue.

The club life, like everything else at Oxford, is too extensive for one man to follow it all. Each student is forced to choose from the number a few clubs which are especially interesting for him and concentrate on them. The Union is by far the largest and best-known society in the university; but I, being an American, studying French on British soil, devoted all my attention to the American Club, the French Club, and the British-American Club. My associations in these three clubs brought me in personal touch with four American students from every state in the United States and with many eminent American, British and French visitors. Perhaps the most wholesome benefit which the student derives from these wide, informal associations with scholars, statesmen, authors, and with his own club mates, is the power of quick, clear, versatile expression, and, above all, the ability to orient himself under varying conditions. For instance, when ministers or members of Parliament come up to debate at the Union, undergraduate members of the club debate alongside of them. In the same way, an ambassador or poet on a visit to some club is usually entertained to dinner by the executive committee and later presented to the club by the student president.

My happiest memories of Oxford are those of associations on and off the athletic field. In America, we often miss this delightful side of college games; we are content for the most part to meet the visiting team as an enemy on the field and are duly happy if we can turn them back with the small end of the score. There, the home team entertains the visitors to luncheon or tea in the college club house, where a special table is set apart for that purpose. In the winter when the afternoons are extremely short, the visiting players have to be content with a drink of beer or shandy at the close of the contest; but when spring comes around with its long, sunshiny afternoons, the tennis and cricket players halt their matches for a full hour at

(Concluded on page 15)

Abrams' Machine a Trap for the Unwary

Concluded from page 3

cording to Abrams, from the vibrations inherent in the drop of blood placed in the dynamizer.

The exhaustive tests carried on by Mr. Rieber, his staff and myself gave the following results:

1. The "dynamizer," as described above, consists merely of a hollow disc of some sort of composition, pierced by the two steel rods, each flattened at the inner end, and bored for the reception of a wire at the outer ends. An electrical current will pass through these rods if applied to them. An electrical current, if applied to them, will not pass out of the wire coming from the steel disc at the top of the dynamizer. No energy appreciable to the most delicate galvanometer, or measurable by the finest ohm-meter, is given off by the dynamizer when the drop of human blood is placed in it, and when it is operated exactly according to Abrams' instructions. The dynamizer, in the words of fact, does nothing, and can do nothing, but serve as a receptacle for the drop of blood.

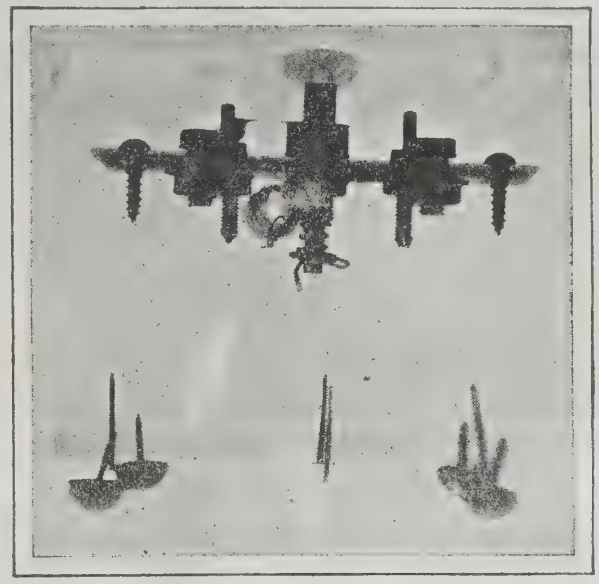
2. The "amplifier" consists of a three-point rheostat, and nothing more. Tested, its three points showed resistance of 0 ohms, 0.34 ohms, and 1.03 ohms. The second contact showed a short circuit, a not uncommon failing of all of Abrams' machines, which are declared to be so delicate that they measure an energy not appreciable by any other instruments yet devised by man. This "amplifier" was tested for inductance, but there was none. The instrument merely registers, in a crude and inaccurate manner, ohmic resistance, and, far from increasing the vibratory rate of any current, would, if the current were actually applied to it, reduce that current. Yet Abrams claims that this contraption "multiplies the rate of vibration of a drop of blood to 50,000 times that of radioactivity."

3. The two "reflexophones" by which Abrams claims to measure this new energy he has discovered, and to measure it in minute fractions of an ohm, are merely rheostats, that is to say, instruments for the measurement of ohmic resistance, similar to but larger than the "amplifier." They are so crudely made that they cannot even measure accurately entire ohms, far from being capable of measuring fractions of an ohm. Repeated checkings of these instruments, using an ohm-meter measuring down to 1/1000th of an ohm, showed a variation in the actual resistance of the points on these rheostats from the amount numbered on the points of as much as 96/100ths, or almost a whole ohm. Construction is so poor that it was necessary to make in many instances as many as ten tests before the actual ohmic resistance of each point could be established. That is to say, these "reflexophones" are merely crude rheostats, capable of measuring small amounts of ohmic resistance, but inaccurate in every one of their measurements. They would be thrown out of any high school laboratory, and one of the pupils put at work building a more accurate instrument. Better rheostats than these can be bought for $1 each in any store selling electrical toys. They mean nothing, do nothing, measure nothing accurately, either medically, electrically or mechanically. Like the sandwich in the snake story, they are "put there just to make it harder."

There are three rheostats to each "reflexophone." One of these rheostats registers from 0 to 10; a second from 0 to 50 by tens, and a third from 0 to 25. The first measures a total of ten ohms, or is supposed so to measure; the second measures 0, 10, 20, 30, 40 and 50 ohms, or is so indicated; while the third measures one ohm divided into twenty-fifths. As has been said, both "reflexophones" are exactly alike. Each, therefore, has a total resistance of 61 ohms, 10 on one switch, 50 on another, and one on the third. Bear in mind that this is the ohmic resistance indicated; it is by no means the actual resistance, as will be shown in a moment. It should be remembered also that a resistance of 61 ohms, electrically speaking, would measure almost nothing in the way of vibrations, certainly it could not hope to measure a vibration "50,000 times as fast as radioactivity." It may be said in passing that the resistance of the ordinary electric light is about 500 ohms. The Abrams "reflexophone" could not measure much more than one-tenth of it, and both combined only about one-fourth of it.

When the "amplifier" is connected with the two "reflexophones," by manipulating the contact arms, the experimenter found that he could throw in a maximum total resistance of 123.37 ohms—122 from the two "reflexophones," and 1.37 ohms from the amplifier. That is all that amplifier and reflexophones do, or can be made to do.

4. When the entire instrument was connected correctly, as instructed by Abrams, with the drop of blood in the "dynamizer," the patient standing on the metal plates and holding the electrode to his forehead, at the same time facing west, as per instructions, not one iota of energy of any kind came from the diagnostic machine. Neither mechanical nor electrical energy could be found proceeding from the ultimate "reflexophone," as claimed by Abrams. That all directions should be followed to the letter, a physician who has taken the full course of instruction from Abrams was present and directed the experiments insofar as the setting up and operation of the diagnostic machine was concerned. He took great care to "demagnetize" the drop of blood from the patient, by passing over it an ordinary steel magnet, from east to west, as instructed by Abrams, prior to making the experiments. In other words, the Abrams Diagnostic Machine delivers nothing in the way of indications of any rate of vibration, or alteration in rate of vibration due to disease, to either the patient undergoing, or the physician making, the diagnosis.



X-Ray photograph of instrument Abrams calls "amplifier." or "stepper-up," and which he claims amplifies the vibrations of a drop of blood to such an extent that they can be measured by the "reflexophones" to which the "amplifier" is connected. As a matter of fact, this "amplifier" is merely a resistance coil with a three-point switch, touching 0 ohms, 0.34 ohms, and 1.03 ohms. It cannot amplify or intensify anything, and if any current or vibration were introduced into it, would reduce, or "step *down*" that current or vibration, instead of increasing it, or "stepping-*up*" as Abrams claims.

Any school boy of average constructive ability can make the entire Abrams Diagnostic Machine without purchasing any equipment except the insulated wire cord, and the result, in all probability, will be a collection of more accurate instruments than those leased by Abrams for $150 down and $5 a month for a lifetime. The writer will undertake to duplicate the entire machine for a maximum cost of $20, and to duplicate them in quantity for less than this.

To ascertain exactly the accuracy with which the contacts on the reflexophones of Abrams are numbered to deal with a vibratory rate of approximately 100,000,000,000 per second, which the Heidelberg graduate declares them capable of measuring, a very delicate ohm-meter was called into service. This instrument—which Abrams declares cannot measure the resistance of the "new force" which he has discovered—indicates accurately ohmic resistance down to 1/1000th part of an ohm. It is to be presumed that this instrument has no prejudice against Dr. Abrams, and that it is not interested in "persecuting" him, the cry which the ERA cult has raised against those who are endeavoring to investigate Abrams and his followers. These ohm-meter tests showed that not a single contact point on any of the six rheostats in the two "reflexophones" register accurately. Following is the record:

0 to 50 Rheostats
(10 ohms between contacts)

Contact as labeled by Abrams	Ohm-meter record on Reflexophone No. 1	Ohm-meter record on Reflexophone No.2
10 ohms	10.8 ohms	10.8 ohms
20 "	21.2 "	21.6 "
30 "	32.0 "	32.0 "
40 "	42.1 "	42.5 "
50 "	54.0 "	53.0 "

0 to 10 Rheostats
(one ohm between contacts)

1 ohm	1.6 ohms	2.0 ohms
2 "	2.4 "	3.0 "
3 "	3.5 "	4.1 "
4 "	4.6 "	5.2 "
5 "	5.7 "	6.4 "
6 "	6.8 "	7.5 "
7 "	8.0 "	8.5 "
8 "	9.1 "	9.7 "
9 "	10.4 "	11.0 "
10 "	11.5 "	11.9 "

0 to 25 Rheostats
(one twenty-fifth ohm between contacts)

	Decimal to compare with meter		
1	.04 ohm	.12 ohm	.26 ohm
2	.08 "	.17 "	.29 "
3	.12 "	.18 "	.31 "
4	.16 "	.24 "	.35 "

15	.60 "	.63 "	.87 "
16	.64 "	.67 "	.94 "
17	.68 "	.71 "	.96 "
18	.72 "	.73 "	.97 "
19	.76 "	.78 "	1.05 "
20	.80 "	.80 "	1.10 "
21	.84 "	.86 "	1.25 "
22	.88 "	.89 "	1.27 "
23	.92 "	.91 "	1.30 "
24	.96 "	.95 "	1.33 "
25	1.00 "	.98 "	1.40 "

These figures are of tremendous importance when it is remembered that Abrams claims to be able, with these crude rheostats, masquerading as "amplifier" and "reflexophones," not only to measure vibrations at a rate exceeding one hundred billion per second, but also to differentiate vibratory rates either above or below this heretofore unmeasurable rate. Even if all the other contentions made by this astounding "healer" were correct—were it true that he has discovered a new force, were it a fact that he has measured the vibrations of the electrons in a drop of blood, were it proved that his "amplifier" operates as he claims it does—were all these claims supported and proved, yet, with the equipment provided in these "reflexophones," he could not even measure the resistance of the current necessary to light an ordinary electric lamp, nor the vibrations of a high-pitched tuning fork. Beyond this, were he able to measure them, even in a crude way, with these "reflexophones," the indicators on all the rheostats in the "reflexophones" are incorrect, making it impossible for him to differentiate between any two vibratory speeds with even a remotely approximate degree of accuracy.

When Abrams talks of measuring vibrations of millions per second, with an instrument which can do only one thing, that one thing being the measurement of low resistances of electric currents, he exposes his ignorance of the elementary laws of electricity, as well as of those of rates of vibration, and he becomes a subject either for pity or for laughter. When Abrams leads a pack of either ignorant or dishonest physicians in the destruction of the health of thousands of men and women, his actions and those of the ERA cult, which he has organized and sponsored, cease to be either pitiful or laughable.

In the preceding article, and in this one, it has been shown that it is mechanically impossible for Dr. Abrams to accomplish the cures he claims with his "oscilloclast," or the diagnoses he pretends to obtain with his "diagnostic machine." In a succeeding article, it will be demonstrated that Abrams' theory of diagnosis and cure is fundamentally wrong, according to what is now actually known and successfully used by physicians of standing, reliability and accomplishment in the fields of medicine and surgery. It will be further shown that, so far as any human being knows today, the Abrams' principle of vibration, on which his so-called "discoveries" are based, is without foundation in fact, and that his "discovery" of "electronic reactions," is a *figment of that same imagination which interfered with the accuracy of certain blood tests when Abrams was connected with the department of pathology in Cooper Medical Institute in San Francisco.*

Cleveland Jews Fight the Interest Sharks

Concluded from page 7

and I followed her out to ask her some questions in private. She told me her story. It seems that she had bought a property and in the transaction gave a second mortgage for $1,800. This she had reduced to $1,100, and was feeling easy that she was getting along so nicely. Then the original holder of this mortgage sold it to another man who proved to be a money shark. The second mortgage came due and the new owner demanded payment in full. He refused to extend the time, but said he would take notes at $40 each and interest on the balance, payable monthly, if she would agree to make the total amount $1,500—$400 more than she really owed. She protested, but there was nothing else for her to do, as she could not borrow the money. So she gave him the notes of $40 each. She had fallen behind two months, and the owner of the second mortgage had notified her that she must pay up or he would take the property. Then she came to us for $100 so she could meet his demands. It was a bitter experience for us to hand over free loan money for such a purpose—to pay interest to a money shark. But what else could we do? There are hundreds of such cases where the money sharks get people in a corner and take their money just like a highwayman does when he puts a gun to your head and demands your wallet.

"My first move in fighting the money sharks would be to establish a huge free loan fund, like our Hebrew Loan Fund, and lend money *without interest* to self-respecting people in need instead of sending them to the Associated Charities. Such a plan would do much to make charity unnecessary. It has done so on a small scale, and why not on a larger scale?

"The Community Fund management could do a great thing in stemming the growth of poverty, by setting aside a million dollars for such a loan fund, to be lent by a board composed of representatives of the various religious organizations of the city. Every borrower should be a member of some church, and the officers of his church should pass on and indorse his application for a loan. Those in charge should be willing to make investigations and render other services in connection with the handling of the money without charge. Once started this fund could be kept going and increasing by memberships and donations. Thousands of people who are on the verge of poverty, could be put on a self-supporting basis by such a free loan fund."

"Have you ever presented this idea to the officials of the Community Fund?" was my next question.

"Yes," replied Mr. Feder a little scornfully, "and I was turned down. Why? Ask the money sharks who are so active in raising money for charitable purposes. They fear a free loan fund. It would injure their business. **Free loans would solve the problem of poverty.**"

The Man Who Made Salome Dance

Concluded from page 6

considering the dry weather, don't you think? Old Larry Ryan cut his 3rd set of Teeth and got his eyesight and hearing back before he went to Prescott and died and Joe Bingham is just cutting his No. 3 Set now —and prouder than a new baby. I think Joe must have found some of these wild Mountain Goat Glands, the way he acts, and I would not be a bit surprised next year to see him quit work, get some short pants and start to school again—if they get a good looking teacher up at Buzzard's Roost."

The prose of the *Sun's* pages is relieved by an occasional bit of verse à la Walt Mason, and, more rarely, by verse in its orthodox form. Of the former I pick this fragment of nonsense as representative: "Tell me, some of you hard-boiled kids, what's the matter with the katydids? What makes them holler all night and squeal like some old wagon with an ungreased wheel? Think it over and when you get through, explain to me why the cats all mew and the dogs all bark and the roosters crow when hens lay eggs—and do you know why fish can't talk and burros can bray and lions roar what they have to say? Did you ever wonder and stop to think how a sponge must feel when it takes a drink and what a thrill there certainly is when a scorpion stings with that tail of his? Do you think that the bud of a blood-red rose blushes at thoughts of what it knows? *Quién sabe?"*

Dick Wick Hall greeted this world he has helped to brighten on March 20, 1877, at Creston, Iowa. His boyhood he spent on a truck-and-fruit farm, where, between school semesters, he learned the ways of birds, bees, snakes and frogs. At the age of 18 we find him attending the University of Nebraska, at Lincoln. Before its faculty could tag him with a degree the wanderlust bacillus got into his blood and multiplied like Ellis Parker Butler's guinea pigs. Urged on to other fields, Hall migrated to Florida to collect snakes and insects for museums. As he told me this his eye took on a dreamy expression and a smile played about his mouth: he was doubtless thinking of the connection between that experience and his well-known pet, "Sand Patter," the desiccated frog.

"Upon my return a little later," he said, "I got a job as fireman on the C., B. & Q. Railroad and in 1898 I came to Arizona. Here I've spent my best years. I clerked in the territorial legislature, held a similar position in the office of the Secretary of State, and, in association with Secretary of State Charles Akers and Paul Hull, a Chicago newspaper man, founded the Arizona *Graphic*, an illustrated weekly descriptive of Arizona. After sticking it out for 28 weeks the paper died of tuberculosis—of consumption complicated by a case of faulty circulation, a symptom manifested soon after birth."

"Then," Hall went on, "I spent two summers among the Moki Indian snake dancers and in the Tonto Basin on a ranch, the old Tewksbery Ranch, which was the scene of the Tewksbery-Graham sheep-and-cattle war described in Zane Grey's 'To the Last Man,' located near the famous Roosevelt Dam.

"And in 1901 I went to Wickenburg, the scene of the Oro Grande gold-mining boom. With my brother Ernest I founded the *News-Herald* and ran it for about a year. During this time I learned something of the printing trade and spent my spare time mining and prospecting. In 1904 I came out of the wilderness ahead of the railroad—the Los Angeles-Phoenix branch of the Santa Fe—and laid out the town site of Salome. Western Arizona was then an isolated country, 15,000 square miles being practically uninhabited, and water holes as scarce as a diabetic bee."

"What is the exact population of Salome today?" I inquired.

"Twenty-three humans and my frog." (Somehow I gathered that the frog is a staunch friend of his.) "Of course," he hastened to explain, "these are what we call the bona fide residents. Besides them there is a lady from Chicago, six or seven Mexicans working on railroad section work, and a young girl from Louisiana who has taken up a homestead down the track. Uncle Sam bet her 320 acres of land that she couldn't live on it five years. And—I think Sam will lose the land!"

"Have you ever been sued for libel?" I ventured, as I recalled his experiences fighting for good roads.

"Not yet," he returned. "Grafters are afraid of too much publicity. I have found that when a politician or anyone else is crooked they don't want too much publicity or any investigation."

Dick Wick Hall is a humorist. For that reason some may find it hard to take him seriously. And yet if you could see his eyes flash lightning and his fist clench when he gets on the subject of roads and road-grafters, you would conclude, then and there, that he is in deadly earnest.

From the topic of roads I led him to that phase of his life which has brought him into the public gaze—his writing. "I have always done more or less writing—ever since I was old enough to have daydreams—generally for my own amusement. I have never tried to make money at it. Since I first broke into the *Post* my work has appeared in *Motor Life* and *Cosmopolitan Motor Sales Service*, and I've had dozens of inquiries for stories and other stuff along the line of the Salome *Sun*. But I've got too much work to do already and haven't had time to accept any of the offers I've had. Some of them are ridiculously extravagant—so much so that I sometimes think the offerers are crazy, or else I am—maybe both. Those folks don't seem to understand that I write for fun and not for money. If I had to sit down and grind it out under contract, *that would be work* and would spoil it all. As it is I get a lot of fun out of writing because I do it whenever I want to, just for my own amusement and the amusement of others who like it."

"How long, on the average, does it take you to get out the copy for one issue of the *Sun?"* was the way I interrupted him.

"Half an hour," he replied, "when I take the notion to do it; sometimes in 15 or 20 minutes. I'm lazy, I suppose—and my many other interests keep me busy 14 to 18 hours a day."

After a pause, his brown eyes twinkling, Hall added: "Remember that I get out the *Sun* to forget my troubles." Troubles which seemed to rest lightly on the capable shoulders of this giant of the desert, as he led the way to a bathtub in which I found "Sand Patter" going through the futile, feeble, unco-ordinated movements characteristic of a tyro among swimmers. The frog was moving on the tub's dry enameled surface.

Market Prices by Radio Aid Farmers, Inquiry Shows

Concluded from page 10

Lonsdale, of Kansas City, Missouri, is equally as enthusiastic about the value of the Radio Market News Service to the grain producer and dealer. He says: "There never has been a time in my experience when the farmer, country grain dealer, and everybody interested in the grain markets in the country, have had as much information and as quickly as they have had since the radio market service was inaugurated."

How quickly the radio telephone has intrenched itself in the affairs of certain rural communities as an indispensable utility is attested by several testimonials, as follows:

"The American farmer is depending on this Radio News Service, and without a doubt he is reaching the place where he cannot do without it any more than his telephone," is the comment of W. P. Humston, of Bosworth, Missouri.

Instead of the "corn-husking bee" or "barn-raising frolic," where the farmers of a particular neighborhood pool their labor and husk their corn or build a new barn, the radio-telephone receiving set is likely to bring together neighboring farmers in the future. "We 'listen-in' to reports before we start to market with our stock and quite often neighbors gather here to hear the markets," notes Lawrence Oberly, of Humboldt, Nebraska. The country bank, too, is becoming a meeting place for farmers who read the bulletin board showing the latest agricultural news via radio. The Farmers' State Bank, of Steel City, Nebraska, writes: "We feel that this service to the farmer is of a very high order and under no circumstances should it be discontinued." This bank purchased and installed a $125 wireless receiving outfit for the exclusive purpose of obtaining live stock and grain reports.

George J. Hunt, of Council Bluffs, Iowa, writes interestingly as follows: "The market reports do not really benefit me for I am not a farmer or grain gambler; nevertheless, I wish to register a protest against their discontinuance. In the past, before the inauguration of broadcast reports when the farmer came to the crossroad trading with butter and eggs, the storekeeper could and did pay any price that suited his fancy, but now he must pay the market price or lose the trade, for the majority of farmers are equipped with up-to-date apparatus and know before they crank up the old car just how much they will receive for their produce."

The First State Bank, of Junction, Illinois, suggests that during the months of January, February, March and April weather reports include the stages and degree of rainfall at Cincinnati, Louisville, Evansville and Mt. Carmel, Illinois. Such information would afford farmers the opportunity to safeguard live stock and grain during high waters.

The rural minister, a bulwark of power in his community, is impressed with the value of the speedy dissemination of market reports by radio telephone. The Rev. Mr. R. H Mormin, rector of St. Peter's Rectory, Alvada, Ohio, says: "I think these reports are the best thing Uncle Sam has done for the farmers, stockmen and bankers in many a day."

The Clintondale Fruit Growers' Co-operative Association, of Clintondale, New York, operates a cold storage plant, and information broadcast by wireless facilities with respect to the prices of apples, pears and grapes, is advantageously utilized. Clarence N. Gilmour of Naperville, Illinois, thinks, "The age of guesswork on the farm is over and marketing is just as important as production," and that the radio telephone is an instrument helpful in achieving this end. Andrew Baur, of St. Louis, Missouri, draws a comparison between an art museum, costing one-fourth of a million dollars annually to maintain, and radio, adding that the latter "gives more enjoyment to the masses for less money."

The replies to this searching questionnaire of the United States Department of Agriculture indicated that 224 radio-telephone receiving sets were then being employed to copy market reports disseminated through the air.

Of the total number of responses, approximately one-sixth received the agricultural information for their own use. Others, recognized by this survey, maintained bulletin boards or otherwise displayed the data for the benefits of neighboring farmers. The Wisconsin farmers, according to knowledge disclosed by these responses, are using wireless receiving outfits ranging in cost from $25 to $400. The common price range, however, varies from $75 to $100.

The United States Department of Agriculture has no ownership in radio telegraph or telephone broadcasting stations nor property rights in any wireless transmitting apparatus. Despite this fact, however, probably agricultural information is more universally borne on electromagnetic waves than any other data having utility value, ranking next to music or other forms of entertainment in the scope of its reach. Ten government owned and operated wireless telegraph and telephone stations and 76 privately owned transmitting stations are, at present, broadcasting crop and market reports. These "electric reservoirs" are located in 65 towns and cities, embracing 33 states. It is, therefore, reasonable to assume that the market quotations on cabbage, cattle, grain, potatoes, apples, and countless other commodities of farm and orchard are distributed by radio telegraph and telephone to that vast area of our country east of the Rocky Mountains and over the Pacific Coast states.

Marketing agencies in three states maintain and operate their own wireless transmitting apparatus, namely, Missouri, Wisconsin and Nebraska. Six other state marketing agencies utilize existing university or college radio facilities for transmitting agricultural knowledge, specifically market reports, these commonwealths being North Carolina, Massachusetts, Ohio, Texas, Iowa and Indiana. The three original radio-telephone broadcasting stations, the first ones to disseminate crop and market reports, are the University of Minnesota, the St. Louis University, located in Missouri, and the Westinghouse Electric and Manufacturing Company, of East Pittsburgh, Pennsylvania.

Causes and Cures of Business Depressions

Concluded from page 8

user of anthracite, has increased 28 per cent in that time. The owners have preferred to pay wages sufficient to cover a full year's earnings for not more than three-fourths of full time, rather than reduce their prices to pre-war figures, increase their output, and reduce their reserves.

Here then are the two elements which in their final analyses are responsible for the high cost of production and the high price of consumption, the producer unable to find a free market because the consumer's ability to purchase is limited by the artificial increase of prices and the monopoly charges covered in house and store rents. So the evil circuit is completed. High taxes on production put the load on the mule's legs; taxes on consumption hang on the mule's neck; and he travels in a bog of high ground rents in the great centers of commerce, production and exchange, and of high monopoly charges for such essentials of life as anthracite coal It is no wonder that the mule "bogs down." So long as the taxes are thus unscientifically and unjustly imposed, so long as the values which are publicly created are privately absorbed, so long will commercial depressions recur. Charges due to excessive rents and bad taxes absorb half the income of wage earners, farmers and salaried classes.

There is to be no reduction in taxes and public charges. Every state, county and municipality is looking for new methods of taxation. Billions of dollars are being raised by states and subordinate taxing powers, and each issue adds to the tax burden for interest. House and apartment rents are up an average of 60 per cent over 1914. In the larger cities the average increase will be nearer 100 per cent, while store and office rents have advanced to 300 per cent of the pre-war figures. These find reflection in all municipal retail prices and therefore affect unfavorably the living expenses of 55 per cent of the population directly, and indirectly the cost of living of all the rest.

The writer gave forecasts of the depression of 1920-21 to his associates in September, 1919. All but one followed his advice to reduce inventories to the lowest limits, to scrutinize credits and to curtail accounts and bills payable rigorously. All but one followed this advice and weathered the storm. The one who failed to do so went under for several million dollars.

Twenty-four thousand failures in 1922, in the face of great industrial activity, with nine-tenths of the farming community complaining that they alone have come down to pre-war prices for their products! To the elements here set forth let one more be added and the next depression can be given a date not far distant. That element can be so imminent a matter as the spread of the unfavorable outlook in the southwestern winter wheat area to include the whole winter wheat belt; or a more serious explosion in the European powder magazine. It might do good for the optimists who read the daily papers with their pages of boom advertisements and propaganda forecasts to turn back to the files of the same papers for December, 1919, and January, 1920. The same optimistic raucous shouting of prosperity to go on for years without a break. There were just two voices of prominent men raised in prophecy of impending calamity, those of Speaker Gillette, of the House of Representatives, and that of the sagacious head of one of the great banks of New York City. Today there are about five forecasters of prominence who are timidly venturing to suggest that the year may not sustain its present activity. Yet the handwriting is already on the wall

The Bird Monument at Salt Lake City

Marble Shaft Commemorates Timely Arrival of Sea Gulls That Saved Mormon Pioneers From Starvation and Ruin

By FRED L. W. BENNETT

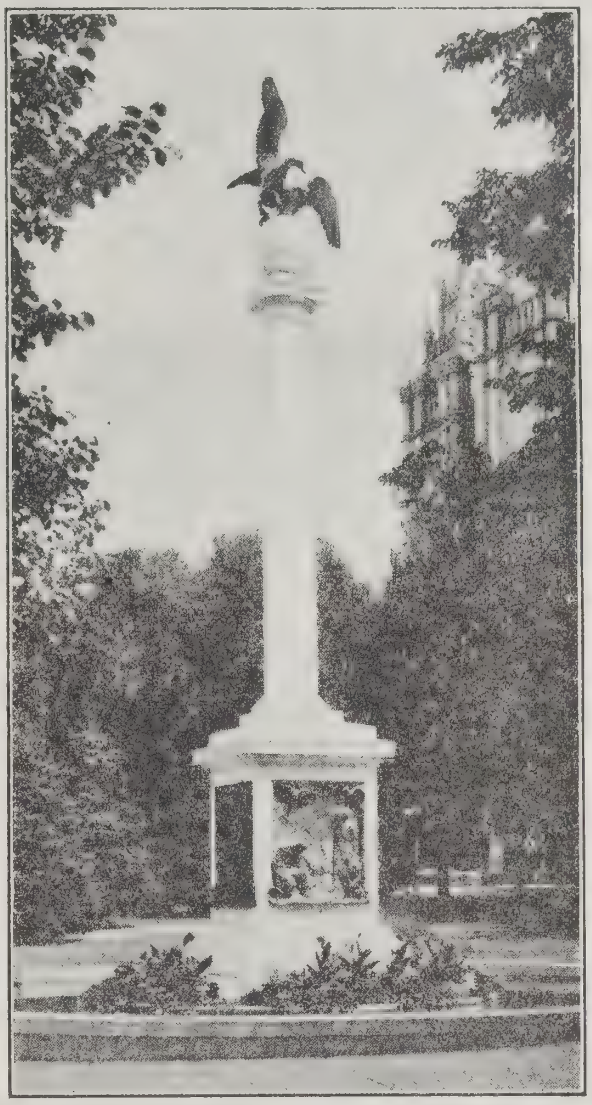
HAD it not been for the timely and vigorous intervention of birds in behalf of the pioneers, it is probable that that great stretch of country comprising the Rocky Mountain States, often referred to as the New West, would not have been known to the present generation as a prosperous section of the United States. The incident resulted in this continent having one of the only two bird monuments to be found in the world, the other, it is said, being in Italy.

The first white settlers in this region were Mormons, who arrived in Great Salt Lake Valley, included in what is now known as the State of Utah, on July 24, 1847. Some plowing and planting was done that year, but owing to the lateness of the season nothing was gathered but a few small potatoes, which were preserved for seed. It was, therefore, with eager anticipation that the people, about 1,800 in number, watched their crops in the spring of the following year. The supplies which they had brought from Illinois were rapidly disappearing and at an early date the colony would be increased by the arrival of 2,500 emigrants.

All went well until the latter part of May, when crickets and grasshoppers began to appear from the mountains and surrounding sagebrush and attack the growing crops. Their numbers increased so rapidly that in a short time there were myriads of them. Thoroughly alarmed, the colonists made hasty preparations for defense and every man, woman and child was called on to help. But all to no purpose. For every insect vanquished there were a thousand to take its place. An elderly woman, now nearly 100 years of age, in discussing the incident with the writer some time ago said: "They came on like a flood. Everything was devoured. Even the small bushes and trees that had been planted were eaten. The fields over which the insects passed resembled ground that has been scorched by fire."

At this time Salt Lake City was 1,000 miles from the nearest point of civilization, with slowly moving ox teams as the only means of travel, or even communication. To obtain assistance would take several months. But who would assist? Had they not been driven into the wilderness by their fellow men in the hope that they would die? The strongest and most hopeful among them discarded their weapons in despair.

Then prayer, the last resort of man, was offered up by the whole colony, but the insects seemed to increase in numbers and destructiveness, if anything. Suddenly the air was filled with plaintive cries and the flapping of wings and the people looked up to behold countless sea gulls which seemed to come from nowhere. The birds immediately settled on the nearly ruined fields and at first it was thought they had come to complete their destruction. But they had come to save. All that day they gorged themselves on the insects, disgorged and feasted again, and it was not until the "enemy" had been annihilated that they took to their wings and disappeared into space.



Sea Gull Monument, Temple Block, Salt Lake City, Utah.

The monument commemorating this event was unveiled on October 1, 1913, and is the work of Mahonri M. Young, well-known American sculptor and a grandson of Brigham Young, the Mormon leader. It stands on Temple Square, in the shadow of the great temple and a moat about eight feet across in circle form adds to its great beauty and charm. The granite base, weighing 20 tons, rests on a concrete foundation. From this base rises a column of granite 15 feet high, surmounted by a granite globe. Two sea gulls of bronze rest on the granite ball. These birds weigh about 500 pounds and the stretch of their wings from tip to tip is eight feet. There are four tablatures and an interpretation of them by a high Mormon official at the time of the unveiling will be of interest:

"The graceful Doric column of the monument surmounting the base is 15 feet high and is topped by a granite sphere, on which two sea gulls are seen in the act of lighting upon it—a most graceful thing in itself.

"On three sides of the high base, in relief sculpture, the sea gull story is told: The tablature on the east tells of the arrival and early movements of the pioneers. In the left foreground of the rugged Wasatch Mountains there is the man afield with ox team, plowing the stubborn soil, aided by the boy driver, followed by the sower. In the right foreground is the wagon home, women preparing the humble meal, while an Indian sits in idle but graceful pose looking on all this strange activity that is to redeem his land from savagery and give it back to civilization.

"The second tablature—on the south—tells the story of the threatened devastation from the crickets' invasion.

"A point of mountain and a glimpse of the placid, distant lake are seen. The farmer's fight with the invading host is ended—he has exhausted all his ingenuity and his strength in the fight. He is beaten—you can see that in the hopeless sinking of his figure to the earth, his bowed head and listless down-hanging hands from which the spade has fallen.

"Despair claims him and laughs. With the woman of this tablature it is different. She is holding a child by the hand—through it she feels throbbing the call of the future—the life of a generation of men and women yet to be.

"Strange that to women—man's complement—is given such superior strength in hours of severest trial . . . .

"But to return to this woman of the second tablature—she, too, is toil-worn, and there is something truly pathetic in her body weariness, but her head is raised—raised to what until now has seemed the pitiless skies; but now they are filled with the oncoming flocks of sea gulls. Does she watch their coming with merely idle curiosity or vague wonderment? Or does her soul in the strange gull cry hear God's answer to her call for help? . . . .

"The third tablature commemorates the pioneers' first harvest—worthily, too. In the background rises Ensign Peak. In the middle background the log home stands finished; in the foreground, harvesting the golden grain is in progress, both men and women take joyous part. To the right, a mother half kneeling holds to her full breast a babe, who 'on the heart and from the heart' receives its nourishment, and about her knees another child plays in happy, childish oblivion of toil and care. O, happy scene of life and joy, 'where plenty leaps to laughing life with her redundant horn.'

"On the fourth tablature is the title of the monument. Fortunately it is simple, and not explanatory—the work of the sculptor tells the story—tells it well and eloquently. Too much narration would have marred it—this is the inscription:

'Sea Gull Monument, Erected in Grateful Remembrance of the Mercy of God to the Mormon Pioneers.'"

Social Life Oxford's Most Important Factor

Concluded from page 12

tea time and either repair to the club house or loll around on the soft turf with their tea and buttered bread. This takes away all the bitterness of defeat without detracting in any way from the keenness of the sport. The boat races in May of each year are the occasion for the sportiest week of the season. Old men return to cheer on their college crews, and both graduates and undergraduates swarm in and out of the college barges lined for half a mile along the north bank of the Isis.

Inter-collegiate sports offer the best opportunity for widening one's circle of acquaintances. An American student, of course, has no difficulty in becoming acquainted with fellow Americans and with men from the British Dominions, but the English are exasperatingly slow to get acquainted, even among themselves, quite as slow as they are popularly represented to be. But an Englishman's sporting side is his best. By the time you have played a game with him, have glared at him over a cup of tea, and then have smoked a pipe of his tobacco—all this without speaking an unnecessary word—he will probably warm up enough to say, "Jolly fine game, eh!" You are now in a fair way to becoming acquainted! Thus in a single afternoon one achieves results which might have required six weeks or more in the dining hall or classroom. Friendships which are so slow to form and so deliberate in their choice are for that same reason all the more satisfactory and the more lasting. Oxford's greatest gift to her students, in my opinion, is a wide circle of understanding friends, and most of these friendships have their beginning on the athletic field.

It would be hard to convince a visitor or a new student that Oxford in winter has any social life at all. The whole university apparently is asleep, and the "gray spires against the pearl gray sky" seem sad and cold. This is only the exterior. While the real spirit of gayety comes with spring, winter also has its happy associations. On the inside, the grate fires burn cheerfully, and little groups of students assemble for afternoon tea, after-dinner coffee, breakfast parties, luncheons, dinners, bridge, and so on.

The different colleges, especially the four colleges for women, enliven the daily routine with an occasional dance or mixed debate; certain clubs manage to give at least one dance a term; other clubs entertain outside friends to informal suppers; and there are a great many dinners at different times in honor of various visitors. On the whole, there are comparatively few big parties as we know them in American universities, where all the students join in the rush. Such affairs are confined almost wholly to the week of races in May and to Commemoration Week in June, when everyone goes in for the celebration, and the college dances run from nine o'clock in the evening to six-thirty the next morning. During the rest of the year the afternoon tea provides an excuse for daily associations between friends and acquaintances. Whether in the students' rooms or at some club, as is the case in winter, or whether they take place on the athletic field or on the river in springtime, these little parties are a constant source of pleasure and profit.

Unless extremely busy, one never has tea alone. It just isn't done! If you want to see a friend about something, you write a note inviting him to tea on a certain day. If you are so unfortunate as to be the chairman of some committee, you put the other members in a good humor by serving them tea before the meeting. Above all, if you want to ask a favor of some friend, you first have him in to tea and catch him there while he has no chance of escape. If you want to meet a certain person—say, a nice looking girl—you can have some friend of yours invite you both in to tea on the same afternoon. Tea is really a great institution! The English have never understood how we Americans manage to get along without it. With them the habit is so firmly established that they have difficulty in conceiving of an afternoon without a cup of tea. One of them once said to me in reply to my statement that I had never been accustomed to drinking tea in the afternoon: "But I say, old thing, what do you do at the 'tea hour'?"

The greatest delight of an Oxford tea is its absolute lack of formality. Professors and students sit on the same level around the tea table. A student reports for tea in a friend's rooms without having to worry about how he shall dress or how long he is going to stay. It is my opinion that the social nature of Oxford life is due most of all to this custom, and I believe also that the custom of tea has been closely related to the college games.

When the change of season, together with the daylight savings hour, brings back the long summer evenings, boating on the river (punting) becomes a dangerous rival for first honors as a social pastime. Supper on the Cherwell, as one sits with charming companions, lazily propped up in cushions, and listens to music from other boats, and hears the careless laughter of friends across the water, and sees the faint lights from the pipes of other epicures—supper under such conditions has something oriental about it.

It will be seen from this short description that associations form the tone of all Oxford life, but these associations take time and depend largely on the individual. The visitor misses all of this inside life. So does the student who tries to live to himself. They both go away without ever having seen the real Oxford, without ever having felt the charm of that fine city whose greatness lies not in the beauty of its spires.

BRIEFLY TOLD

Two great highways in the Province of Quebec are to be brilliantly lighted. One road runs from Montreal to Quebec and the other from Montreal to the United States boundary.

Smyrna is to be rebuilt by an Ottoman company which will work together with the Banque Nationale de Credit and the Banque Perrier, of France. The company contemplates reconstructing houses and other buildings in Turkish style.

One-third of the earnings of the German husband must be given to the wife to maintain the family table. That is the German law. This one-third income is not to meet wages of servants or rent but merely to cover the expense of keeping up the table.

Nearly 20,000 quarts of skimmed milk a day are used in France for making substitutes for horn, ivory and amber. The casein in the milk is mixed with formaline producing "petrified" milk, a hard, elastic, involuble substance that is easily worked.

Mosul, the center of the rich Mesopotamian oil fields, is 70 miles from a railroad.

The Indian Archipelago consists of thousands of green islands and islets scattered over the Austral-Asiatic Mediterranean Sea, separating the Pacific from the Indian Ocean. It took an aviator four days to cross the archipelago by airplane on his way from Singapore to Australia, flying every day as long as the sun shone. The population of the archipelago numbers approximately 48,000,000, of which 34,000,000 live in Java.

Paris has 265,000 vehicles of all kinds.

More than 350 children are living on canal boats in the United States. This interferes with the children's schooling as the boating season on the canals ranges from seven to nine months in length.

We have reached the stage in our agricultural development where there is practically no more potential agricultural land left unutilized that does not involve unprofitable expense for reclamation or clearing, according to an agricultural economist connected with the Department of Agriculture. However, much of our agricultural land can be cultivated more intensively, when higher prices for produce justify the increased costs of production.

Nova Scotia has adopted the "drive-to-the-right" rule of the road.

The body of Edith Cavell's dog, which died in Brussels, is to be placed in the zoological department of the British Museum. On the day before her execution by the Germans, Miss Cavell gave the dog to a friend who cared for the animal until it died.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

A United States marshal was taken ill with appendicitis while taking an Indian accused of murder from Fort Gibbon to Fairbanks, Alaska. The Indian prisoner placed the officer on the sled and mushed more than 100 miles with him to a hospital, where an operation was performed.

The British Museum is being flooded with Egyptian antiquities from private collectors who fear to retain them, as they believe that Lord Carnarvon was killed by Tutankhamen's KA—his soul's double.

A two-gun, hammer-fanning Indian fighter and frontier scout, who had in his lifetime killed eight white bandits and 20 Indians, was crushed to death in an elevator shaft at the Omaha *World Herald* plant, where he was employed as night watchman. In 1892, in the battle of Wounded Knee, South Dakota, he killed 11 Indians with 12 shots, using both guns, hammer-fanning. He was chief scoutmaster for General Phil Sheridan for six years and was never beaten on the draw.

The Eiffel Tower of Paris may soon be demolished and the material of which it is constructed used for reconstruction work in the devastated regions. The wireless station at Saint Assase, near Melun, possesses superior facilities for receiving and transmission compared to the Eiffel Tower.

New York has passed a law prohibiting the scaling of skyscraper walls by so-called "human flies."

President Harding has purchased his birthplace—a farm in Morrow County, Ohio—where he passed his boyhood. A modern bungalow and golf course will be built, it is said. The President plans to retire to the farm after leaving the White House.

Travelers report that in the Herzegovina, Southern Slavia, there are so-called women-villages, where the wives, whose husbands have emigrated to America, live with their children. It seems the men cannot earn enough to have their families follow them to the new country.

Austria has put out a series of seven postage stamps. Each issue bears the portrait of a famous musician.

A traveling court, consisting of 25 sheriffs, a prosecuting attorney and a justice of the peace, has set a new precedent in law enforcement by setting up a court at the scene of arrest, in Clay County, Missouri. They travel into the hills where the judge sentences the bootleggers and owners of stills.

No longer will it be legal for hunters to have their guides do their shooting for them in New York State. Under the present law guides are prohibited from carrying guns while practicing their calling. The hunter who wants to make his own kills will be pleased with the new law.

Belgium is supporting 17,016 war orphans, of whom only 9,700 are the children of soldiers killed at the front, while 8,900 are the offspring of fathers who as civilians were shot by the Germans.

A bronze marker was put up on the side of a building on Second street in Sacramento, California, recently, carrying this legend: "Site of Terminal of Pony Express, 1860-1861. Marked by Daughters of the American Revolution, Sacramento and San Francisco Bay Chapters, 1923."

All ex-service pigeons which were several times under fire during the war while carrying important messages for the British Army and Navy have been pensioned off for life by the British War Department, in the care of a special keeper.

Convicted on a charge of cruelty to animals, a contractor of Little Rock, Arkansas, was sentenced in municipal court to read Anna M. Sewell's book, "Black Beauty." The court gave him 30 days in which to read the book and at the end of that period an oral examination on the book will be held. Protests have been lodged with Arkansas state officials against the alleged brutal treatment received by horses, mules and oxen in Eldorado and Smackover oil fields.

CHRONICLER OF THE NEGLECTED TRUTH

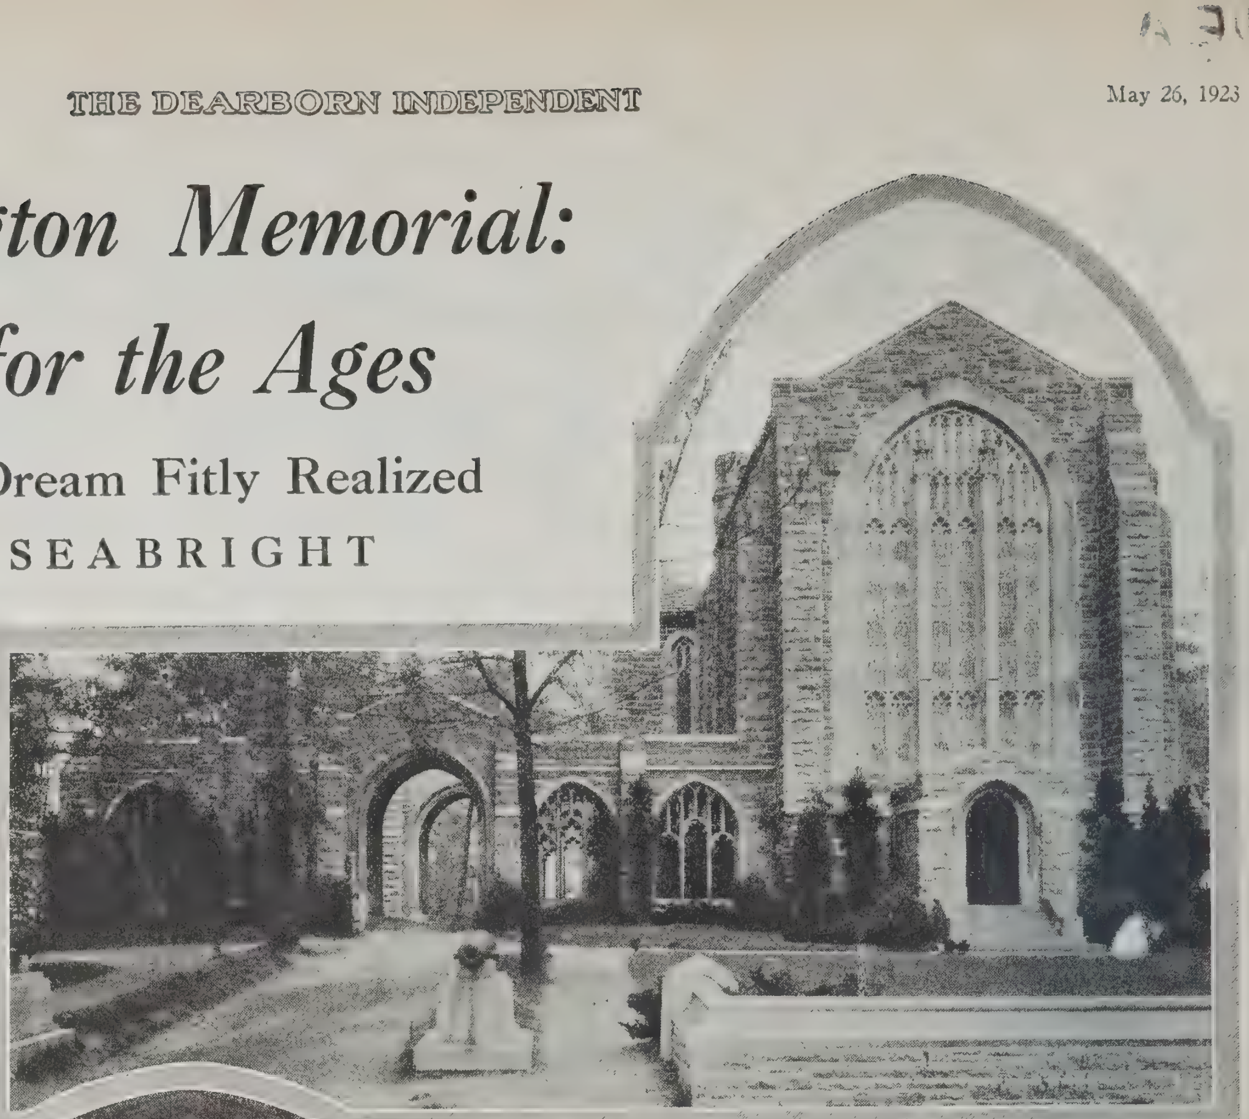
The Washington Memorial: a Shrine for the Ages

Story of a Noble Dream Fitly Realized

By J. M. SEABRIGHT

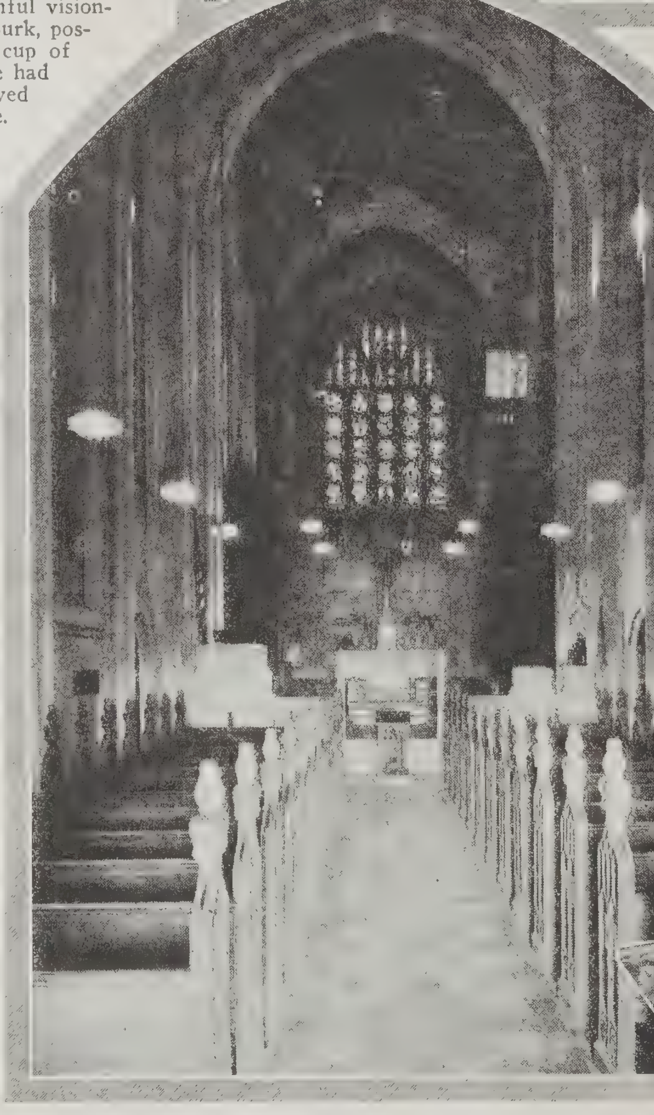
ON WASHINGTON'S BIRTHDAY 20 years ago, a young Episcopal clergyman, the rector of a small church in Norristown, Pennsylvania, preached a sermon on "Washington the Churchman," in the course of which, dwelling particularly on Washington's worship at Valley Forge, just across the Schuylkill River, he said, "Would that there we might rear a wayside chapel, fit memorial of the church's most honored son, to be the nation's Bethel for all days to come, where the American patriot might kneel in quest of that courage and that strength to make all honorable his citizenship here below, and prove his claim to that above!" The sermon was printed in a Norristown newspaper, and the suggestion approved by the American press.



The Washington Memorial Chapel and the Cloister of the Colonies.

To translate that wish into material form required not merely vision, not merely a high and patriotic purpose; it demanded years of patience, of zeal, of indomitable courage, of herculean effort. And the youthful visionary, the Reverend W. Herbert Burk, possessed all these qualities. The cup of bitterness he was to quaff, but he had dreamed a dream, and he resolved to make that dream come true.

A far cry it is, ofttimes, from a mental resolution to a tangible reality, from a figment of the mind to a creation palpable and enduring. And such was the experience of Dr. Burk. All whom he approached, including the bishop of the diocese, turned a dull, cold ear to his enthusiasm. That is, at first. But, later, men and women were moved by the young man's fluent speech, his Niagara-like energy, his flaming zeal. He began aright by obtaining the services of one of America's greatest architects, then a man unknown to fame, Mr. Milton B. Medary, Jr. Dr. Burk drew up the plan for an architectural competition, with King's College Chapel for his ideal. He had abandoned the Colonial, as it was Georgian, and, as he said, "We were fighting George then, and we do not want Georgian architecture at Valley Forge." He dreamed of San Chapelle, too, but that was French, and at Valley Forge were Englishmen fighting for English rights and liberties. That is why America has this splendid example of Perpendicular Gothic, rivalling the greatest creations of the Old World. He appealed to Dr. Charles Custis Harrison, provost of the University of Pennsylvania, to have the department of architecture conduct the competition and select the architect.



The interior of the Washington Memorial Chapel.

In this way the services of Professor Warren P. Laird, the present dean of the school of fine arts of that university, were secured, and his trained judgment led him to select the plans of Mr. Medary. Professor Laird thus speaks of the successful design: "Its ensemble expresses truthfully the theme of the competition; a memorial chapel with auxiliary structures. The chapel dominates the group while not overpowering it, and the tower, higher than the chapel and sufficient for its purpose as an observatory, is placed at the right point to complete the balance of the group. This is as simple in plan as it is effective in mass. The chapel, while pure in historic character and fine in proportion, has an expression of dignity, repose, and strength, which it would be difficult to carry further toward harmony with the sentiment of Valley Forge. In its wall and window treatment there is presented, as nearly as possible in a place intended for worship rather than defense, the medieval approach of the church to fortress building. The other portions of the group are true in character and in proportion with the chapel. The plan arrangement of this group combines more of simplicity, compactness, and economy, both of construction and administration, than any other in the competition. In architectural quality it is scholarly and tasteful to an unusual degree and possesses real charm and distinction. To this may be added the thought that if it be true that architecture is frozen music the chapel is a congealed symphony of Beethoven.

The work was retarded because of insufficient funds, but, through the unswerving efforts of a large and influential committee, the chapel rose, little by little, until, in 1905, it was so far completed that on Washington's Birthday of that year the first service was held therein.

But still the work lagged. Dr. Burk's slogan being "Prayer and Advertising," the latter took the form of appeals to such patriotic societies as the Daughters of the American Revolution, the Sons of the American Revolution, and the Colonial Dames, as well as to the 13 original states. The appeals were not in vain, and, as a result, it is now practically complete.

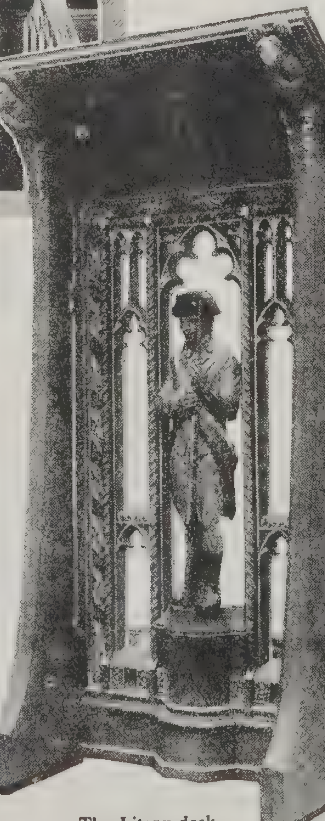
As you enter the Washington Memorial Chapel you are thrilled with pride. An Old World charm permeates the place; the glare of day surrenders to the subdued red and blue colors filtered through the glorious stained-glass windows. These last are of such entrancing beauty that, according to A. Edward Newton, E. V. Lucas, on seeing them, exclaimed: "They are as lovely as the windows of Sainte Chapelle."

A closer inspection of the chapel reveals the surprising fact that no pains have been spared in attention to its details. Everything about this cathedral in miniature means something, has some historic significance.

To the right of the doorway stands the Washington-Sullivan font, of Indiana limestone, on the faces of which are carved the Washington arms. The wall back of the font bears the quaint and interesting record of Washington's birth and baptism as it is found in his mother's Bible:

"George Washington was made a Member of Christ, the Child of God, and an Inheritor of the Kingdom of Heaven, in the Sacrament of Holy Baptism Ministered according to the Use of The Church of England, whereof this Font is a Memorial, and this the Record: George Washington, Son of Augustine & Mary, his Wife, was Born ye 11th day of February, *173½ about 10 in the Morning & was Baptized on the 3th of April following, Mr. Beverly Whiting & Cap't Christopher Brooks, Godfathers, and Mrs. Mildred Gregory, Godmother."

Near the font you will see the strong box used by Robert Morris during the Revolution. This valuable relic, a fine specimen of early craftsmanship, lent by his great-granddaughter, Mrs. Charles Custis Harrison, still serves a utilitarian purpose—being the receptacle for the voluntary contributions of visitors for the chapel's maintenance. The pews, known as the Pews of the Patriots, are worthy memorials to those brave men who made possible the "sunrise of national glory." On the base of each pew is carved either the family arms, the insignia of a patriotic society, or the colonial seal or state arms. The President's Pew, bearing the arms of the United States and the seal of the President, was given in memory of Washington and Monroe, who were at Valley Forge, and commemorates the address, in 1904, of President Roosevelt, the first President to visit this sacred ground.



The Litany desk.

Lack of space prevents detailed mention of the elaborately carved pew screens, the Litany desk, and the memorial tablets. Suffice it to record, however, in these days when ease is often dominant, this excerpt from Washington's diary of June 1, 1774, cut in the brass insert of the Litany desk:

"Went to Church & Fasted All Day."

The several doors next catch our attention—the Door of the Allies, bearing the arms of Rochambeau and other friends of the new Nation; the Inauguration Door, displaying the arms of the 13 states; and the Choir Door of oak, richly carved.

At the entrance to the choir

(Concluded on page 6)

The Billboard—Through Nature's Looking-Glass

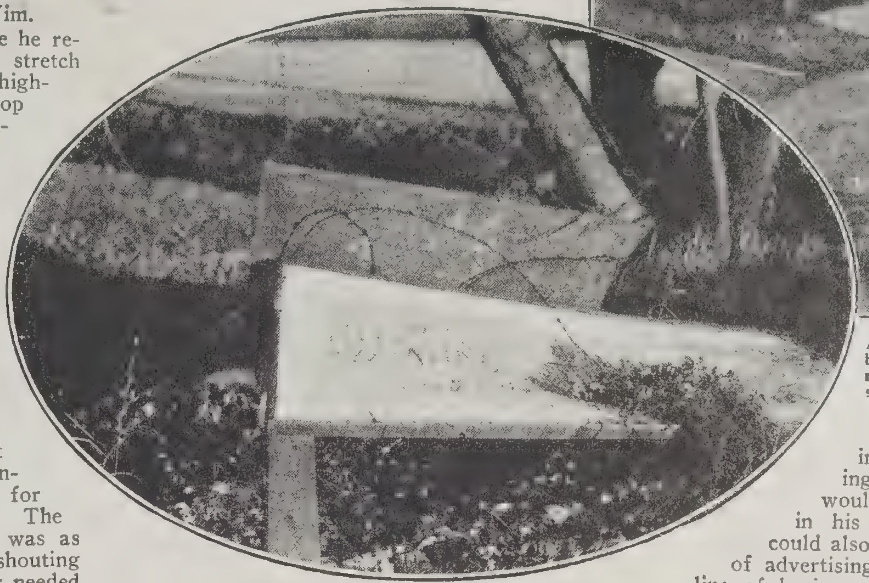
Once Denounced, Now Artists and Architects Unite to Make the Signboard a Thing of Beauty and a Part of the Road's Romance

By FRANZ A. AUST,

Associate Professor of Landscape Design, University of Wisconsin.

NAKOMA
TRADING POST

Artistic in its setting of natural boulder and shrub, this signboard resembles some of overhanging designs which were to be seen in Revolutionary Days.



Faded and forlorn, these billboards rest where they fell—by the side of the road.

"JUST fifty-one!"

"Fifty-one what?" questioned Jim.

Hank stepped on the gas before he replied. "Why, didn't you see? In this stretch along here I had to slow up to find the highway signs, and I counted 'em—repair shop signs, and yeast, and the 'Best-Hotel-in-the-City' (five different times), and seven garages, and cough drops, and—well, it's like looking for the bean in the restaurant soup to find the board that tells you the direction to go."

It was true. Loudly calling their wares in an area of 150 feet were 51 wooden criers, round and square and oblong; little and big and middle-sized; red and yellow and green and blue and mixed. The great signs which took up so much space and overshadowed the rest had been placed there by an association of distributors; the small ones, most of them, were the result of the efforts of individuals who had considered this location particularly good for sticking in a sign along with the others. The confusion in the mind of the passer-by was as great as though each had been verbally shouting his wares. The highway markers, greatly needed at this point, were the silent members. And the effect of the whole was far from pleasing to look on.

Lack of beauty is one of the greatest reasons why the women's clubs of America are crying out for a removal of all the advertising on all the roads which lead into their particular cities and towns. "Billboards are so hideous," they object. "Let's do away with them from all places, especially where they hide the beautiful views." For years the women have been valiantly trying to bring this about, but only through educating the public to a higher standard of outdoor beauty will they be able to accomplish anything.

Law can interfere only when signboards become a real danger to travelers along the way. And this is where the tourist gets in his word. "Take 'em all away except the highway markers," says he. But bills are slow to make an entering wedge into legislatures; lawmakers are sometimes slow to act; advertising signs are still with us in large numbers. Illinois, to be sure, has regulated the height of the bottom of all her billboards so that fleeing thief or slayer can have no opportunity to take on new breathing power behind their friendly shelter. Wisconsin's law allows no advertising markers within a radius of 400 feet where road meets road. Other states are considering the passing of bills of a similar nature. Precautions are these which make for public safety.

Signboard Cannot Be Abolished

BUT to end the career of the signboard along the roads and railroads would indeed be a mistake. For with our present system of buying and selling both national and local concerns demand it. Go back a few years to the days when business men's clubs must have had enthusiastic members in such cities as those which basked in the shade of old Vesuvius. Since the earth has been shoveled out of Pompeii and Herculaneum's main streets, there have come to light walls gay with lettering done in red and black. It's the outdoor advertising which even 2,000 years ago they had discovered they couldn't do without. Every city of Europe and of the British Isles sooner or later found it a convenience for bringing better business, and the colonists inherited the idea along with the warming pan and the old candle sticks. In fact, some of the beauty wrought into the overhanging signs of the old taverns of Revolutionary Days is still considered worthy of highest art merit.

And now when rightly planned and properly placed, nothing affords the business man so effective a means of catching the big American eye. Outdoor advertising is not so expensive as the pages of magazines and newspapers, many of which employ the best artists the country can produce to make them attractive. Outdoor advertising is less expensive, but, on the other hand, skill and good taste and foresight can make it, too, a real work of art—a compliment to American thoughtfulness and to the nation's outdoor beauty.

Art and Architecture Find a Field

ON THE approach to one of Minnesota's large cities along the Yellowstone Trail is a unique idea which can be carried out by any city and town in the country. A large billboard, 14 feet high by 150 feet long, has been artistically designed by an architect. To give the most pleasing effect, shrubs and vines have been grouped about it by a landscape gardener. In front of the board is a strip of grassy lawn, well cared for and calling attention to the neatness of the whole. Electric lights shine on it by night. And instead of being placed where it will cut off a charming view of lake or stream or hill or wood, it acts as a screen for a swamp and an ugly tin can dump.

To take the place of Hank's 51 signs of assorted sizes, there appears on the face of the large billboard in clear, readable letters the name of one firm in each of many special types of business. "Wheeler's Filling Station" takes up the space in one of the upper corners. Below that, "Niplock's Barber Shop, Shaves and Bobs" glows forth in the light of the sun or electric bulb. "Pincher's Boot Shop" has an attractive square, and then follow successively a clothing shop, a dry goods store, a hotel, a grocery, and so on until the board is filled.

For a stretch of two miles out of the city, this idea is repeated at intervals. Each billboard tells the story of a different set of business men, and only one business in each particular line is set forth. Thus is the value of the advertising for each increased.

The Chamber of Commerce in any one of America's cities can do much toward bringing about appropriate settings for advertisers to use. Rotary or Kiwanis or Lions' clubs, for instance, of which nearly every city of size has organizations, could be made responsible for the signboards on certain approaches to the city. They would see that signs were placed only in the locations suitable for their use. These groups would have the responsibility of the care of the signs, too, and would see that they were kept up and were not molested. There would be a personal interest because the advertising of each member's business would undoubtedly be included in his group section. This plan could also be made to insure a display of advertising for only one firm in each line of business wherever signs were to be grouped.

When individuals advertise separately in outdoor signs, what protection does his billboard or poster or marker possess? Mischievous boys on Hallowe'en pull up every sign they can find and tear off every poster along the way. Business men cannot demand that the damage be repaired because they no more asked permission to place the signs than did the youngsters to tear them down. But where business men of a community co-operate, a sign which needs repair or replacing receives it because every man contributes to a fund set aside for that purpose.

No longer will weather-beaten, tumble-down signs implying "even so is the business" be seen in the land, when communities work together with a definite system in mind. No longer will brilliant metal squares be tacked on trees and hung on fence wires, respectively, to desecrate the beauty of the trees and to rust themselves away.

No more will expectant faces of "candidates" look forth from telephone poles as studies in black and white.

The Co-operative Signboard

THOSE 51 signs which Hank counted when on his motor trip with Jim had cost the owners $300, to say nothing of the expense of placing them there.

Within three months all of them were removed because they had become so great a highway nuisance. The owners did not find it worth while to save the signs, and the $300 had been lost to the community. What splendidly permanent co-operative signboards that $300 would have built!

Carefully chosen billboards designed in an artistic way and placed in a setting of vines and shrubs, with grass and flowers about, will soon put a kindlier expression on the face of Mother Nature for the traveler who enters city or village to see. Billboards can be formal or informal, but the secret of their art is that they should seem to "belong" wherever they are placed.

In a grassy pasture along a certain railroad track appear three life-size wooden cows. They seem to graze peacefully, as wooden milk maids in wooden sunbonnets milk into wooden pails.

It gives one a feeling of admiration for the cleverness of the design and its appropriateness of setting; it furnishes one with added respect for the business and the dairy products which are so fittingly advertised.

There's a place for every sign when every sign's in its place!

"Saturation" in Business

JUST how much reliance may be placed on government reports of business conditions, each interested person must decide for himself. The rise of numerous private agencies for the collection and distribution of the same sort of information would indicate that government reports are not 100 per cent illuminating nor reliable. Then, of course, there was the recent sugar report issued by Mr. Hoover's department and the subsequent foozle.

Rather tardily and wholly without foundation a government department now warns that certain lines of business have reached the "saturation" point. Business "experts" like to roll that term—"saturation point"—under their tongues. Of what one useful commodity has the country too large a supply?—let them answer that. Of what one article necessary to the comfort and progress of the American family have too many been produced and sold?—let them answer that. The state of affairs is this: lines of useful business are away behind in their orders. The markets, so far from being saturated, are thirstily calling for more goods.

Not being business men, the heads of government departments are not able to identify what they see. They do not see "saturation"—what they see is unbalanced activity on the part of the business community. The present productive capacity of the United States is not sufficient, in some lines, to satisfy the demand. The temptation, therefore, is to increase that productive capacity, that is, permit the crowding into 1923 of the normal business that should wait until 1924. If this could be done without producing dislocation in the raw material supply and market, it would probably be as safe and normal a course as any. But as it now happens, manufacturing capacity can be increased at a faster rate than the production of materials can be increased, and the result is a mad scramble among manufacturers for material, a competitive bidding which sends up the prices of materials, which in turn sends up the prices of the manufactured product, which in turn chills the buyer and cuts off business.

That is what the government "experts" see, if they see anything, but you never yet saw a government "expert" read a lecture to the big fellows—their words always apply to the little fellows. Let business keep its gait, and measure its gait by the supply of material at reasonable prices. Let the producers of material begin a steady increase in their production and a steady reduction in their costs. Then we shall witness an era of business which shall be at least a beginning in supplying the need of this and other countries.

Just now "saturation" can only mean that a select buying circle is supplied; it cannot mean that the needs of the entire country have been met.

Predicts a Coal Shortage

COAL MINING JOURNAL predicts a bituminous shortage next winter unless production increases or consumption is curtailed. At present volume of output and demand the country will need nearly 50,000,000 tons more than can be produced, while requirements are increasing daily. With knowledge of such a condition in the industry it would seem possible that provision could easily be made to meet it. Only a few weeks ago we were told the trouble with coal was over-production—that it was impossible to confine mining to an area sufficient to fill the country's needs and employ only men enough to have continuous work for all. It was the surplus coal, we were told, which made it impossible to give miners more than 200 working days in a year.

The *Journal* follows its editorial view on the shortage with another in which it presents a similar danger in the matter of labor. Restriction of immigration, it is feared, will menace the industry, because so many miners are finding employment in lines where steady work is possible, "at fairly good wages, even if at less per day than can be earned in the coal mines."

There is logic for you! Too great development six months ago, but now a shortage of production threatened because men are finding employment in industries where the annual income is greater, although the daily wage is smaller!

Meanwhile the *Journal* is urging all operators to join the American Coal Association effectively to combat the United Mine Workers and the interference of government in their business!

The Burden of Interest

THE following table is credited to Federal Treasury experts as showing the distribution of each dollar of government revenue. It is illuminating, because only a glance is needed to learn what proportion of the taxes we pay, directly and indirectly, is used for any particular purpose.

The astonishing fact that *more than a quarter of the revenue goes for interest* should awake the public mind to the pertinence of the argument that there is no real necessity of paying interest at all, and that the country is submitting to it because of a false notion that the United States is compelled to borrow the money which it alone can create.

If to the interest charge is added that for militaristic purposes, half the cost of government is accounted for, and it is likely the remainder of the budget can be pared considerably.

Of every dollar of revenue the following funds receive the proportions stated in the column opposite them:

1. Interest on public debt	$ .2660
2. Sinking fund to reduce debt	.11
3. Care of World War veterans	.10
4. Civil and Mexican War pensions	.07
5. Maintaining army establishment	.12
6. Maintaining the navy	.125
7. Tax refunds on govt. overcharges	.0232
8. To pay Shipping Board expenses	.0229
9. Care of the Indians	.01
10. Building public roads	.0242
11. Other govt. activities	.1287

Where Salvation Is Free

A PENNSYLVANIA preacher announces that he has banished the collection plate and that hereafter worshipers will not be disturbed by having the offending article thrust into their meditations. His argument is that the public offertory is an unnecessary evil.

The *Florida Christian Advocate* facetiously quotes some one who suggests such a plan could not work in a Methodist church, since an offering to the Lord is an essential element of worship and that "where two or three Methodists gather together, there the collection plate is also."

But the same paper tells of a Methodist congregation in North Carolina which has not made a collection in three years, nor assessed nor pledged a member, yet it has carried a budget of $17,000 without a deficit.

Copyrighting Argument

AN EDITORIAL from the *National Republican* recently was commented on and criticised by a writer in the *Country Gentleman*. The Washington paper announced a rejoinder, and at once received a letter from the managing editor of the Philadelphia paper that the contents of the *Country Gentleman* are protected by copyright, and quotations from them will be considered an infringement. Hence the reply by the *Republican* to an attack upon its views is impossible.

It is a new angle to the art of argument—that an opponent's argument cannot be quoted to be refuted, because it is copyright.

In which connection it may be worth stating that no argument printed in The Dearborn Independent is copyright.

"The Banks' Boston Tea Party"

AS The Dearborn Independent has had occasion to remark several times, just criticism of the Federal Reserve System is not confined to those who would do away with it, by any means. Financial papers, which deem it a means of much benefit to the country, are more and more freely discussing in plain words its defects and the causes which have made it unpopular.

Under the title above, the *Banker and Financier*, New York, notes the Congressional inquiry into the reasons for the refusal of banks qualified for membership to join the system. Even the smaller banks to which the privilege of membership has recently been extended, hold aloof, the only important recent recruits being found among the new National banks, whose membership is compulsory, many of which have been chartered with small capitalization under the retiring Controller of the Currency, whose special aversion is the small bank, and who, in his report at the close of 1921, boasted of the number of charter rejections he had ordered.

The *Banker and Financier* insists that, while "admittedly most beneficent in origin and beneficial in operation," the Federal Reserve System lacks friends in its own particular field. According to reports, from 8,000 to 10,000 banks, fully qualified for membership, refuse to come under its authority. The exact language of the editorial under review is significant:

"This point-blank opposition cannot be dismissed lightly. The recalcitrant banks do not remain without the pale because of pique, shortsightedness or misunderstanding. They stay out because they feel it safer to be free. Over and above this, they refuse to affiliate because they do not like the administration of the system. The bureaucratic authority which seems to prevail, and the lack of human sentiment that characterizes the relations between the system and the common membership, are potent causes for this spirit of aloofness."

In plain terms, justifying itself by its conviction that correction can best be secured by admission of its need, the *Banker and Financier* proceeds to excoriate the Federal Reserve banks for persecution of small banks, which is known everywhere and will not be forgotten for years.

Of the feeling against the system it says that never before in the history of the country has there been such a revolt against constituted authority.

"About the last place to look for rebellion against authority is where banks are involved, and yet we find thousands of small institutions taking their very lives in hand to fight for what they deem their liberty. The Boston Tea Party was not a more courageous enterprise."

The reader is challenged to find a more severe criticism for the Federal Reserve System. Those who would do away with it oppose it from principle, because of its power for ill; this friend denounces the wrong it has done. The Dearborn Independent has related instances, two in particular, where victims have sought relief in the courts. The *Banker and Financier* goes further and recites a practice that has not generally been known:

"The Reserve System itself, acting through its regional banks, has seemed to take pleasure in emblazoning the names of banks which do not submit tamely to the arbitrary dictum of the powers that be. Almost every week sees the issue of an official circular, emanating from some district, giving what are termed revised lists of non-member state banks and trust companies on which the Reserve Banks refuse to accept checks. The word 'dishonored' is used frequently in these circulars—used intentionally, so it would appear from the verbiage—and the implication is plain that the institutions named are under the ban as pseudo-criminals. Perhaps it is necessary for the information of the customers of the Reserve Banks that these lists should be issued, but their repetition and duplication at short intervals is not of a nature to heal the breach."

The same day the *Banker and Financier* was received came the current issue of the *Pacific Banker*, published at Portland, Oregon, in which the following editorial note gave light as to the feeling in the Northwest:

"Small state banks are in no hurry to join the Federal Reserve System, despite recent amendments reducing capital requirements for entry. Why should they be? Why should some 4,039 small fellows rush down the 'sawdust trail' when for these many years some 9,678 had the chance but never took it? It is not the lack of an admission ticket that is keeping the little fellows out."

Mr. Ford's Page

THE Peace Ship, so-called, was an attempt to provide a means of expression for the Spirit of Peace which at the time the ship sailed had no adequate means of expressing itself to the world. Tragic beyond words was the fact which faced us all in 1914, that every kind of spirit had machinery through which to function, except the Peace spirit. The political world was organized for anything but that. Turn where it would, the Peace spirit, like Noah's dove, found no place to alight, and those who befriended it in those days were likely to receive abuse as the wages of their loyalty.

The Peace Ship sailed—indeed, the Peace Ship is sailing yet—and it is interesting to recall the stages through which the Peace sentiment has passed since that time. At the beginning the very thought was a heresy, something to be denounced and punished. It is hard to believe, but there actually was a time in this country when it was counted unpatriotic to feel the terrible folly of slaughtering the bodies of millions of young men to settle the quarrels of a few exploiters. Soon, however, Peace was said to be the very object of the war—the war, we were told, was being fought in order that war should no longer be possible. That is to say, the diplomatists and militarists adopted the Peace idea as the strongest plea they could find to justify the war. Last of all came the Versailles Treaty, whose whole pretense was peace, and whose whole effect has been just the opposite.

Thus in curious blend, both war and "pacifism" combined to exalt the idea of Peace. But there is no peace as yet. It is doubtful that war's last thunder has been stilled. It may be that the fire has yet to run through more of earth's rubbish heaps and clean them out. No one whose eyes are open can view indifferently the present state of the world. The worst thing that remains is that the old system is still in the saddle and crying to be saved—especially crying to America to save it and identifying itself with "civilization"—and if that system retains power long enough we shall see a renewal of war. There will probably, however, be this mitigation, that as in the last war the wrong people fought each other, the next war may see a truer line-up for the final establishment of an era of real peace—not a mere paper peace, but a genuine peace of the peoples of the earth.

> *IDEALS which are realized are seldom spoken of. When the world speaks loudly of self-government, it may be set down that it is an ideal yet to be brought into actuality. We admire that which we lack, we rhapsodize about that which has not yet come into being. The advantages which the "privileged classes" enjoy become after a time the "rights" of all classes. The few adventurous souls of each generation win something for themselves, and the resentment of the majority against that sort of privilege leads to a general distribution of the same thing among all the people. Little by little we advance, but we are not arrived at our commonest ideals yet. The world is still governed by a hidden oligarchy which is not superhuman, but inhuman, and wholly disconnected with the normal human interests of the majority of mankind.*

The practical results achieved by the Peace Ship seem to be worrying some minds today. It is strange enough that any honest movement for Peace should have its enemies, but it is stranger still that these enemies should believe that they are harrying its friends by occasional reference to it. The notion seems to be that someone wants the Peace Ship "sunk without trace," forgotten, repudiated, and that the best way to offend or to embarrass is to bring it to memory again. One man at least stands ready to say that so far as he is concerned the more that is learned about the Peace Ship the better, and the more that is learned of what the Peace Ship discovered, the better.

Stripped of the unofficial and over-enthusiastic utterances of persons who spoke for themselves only, and whose curious slogans caught the public imagination for a time to the obscuration of the ship's real purpose, the original purpose of the venture was to see if the actual basis for peace which existed at that time was available; and the total result of the venture was an education in the forces behind the war.

It goes without saying that aboard the ship were the representatives of the hidden power which knows more about the war today than anyone else knows, and which before the war occurred at all knew more about it than anyone else knew. Their business was to find out how much of their plans was known and also to see that their interests were not materially injured by an inquiry into the forces behind the war.

The inside story of the Peace Ship will not be told here, but of the knowledge gained or the information confirmed, this much may be said: The people do not rule; the governments do not govern; the world until now has been ruled by a power in the background which is international, whose chessboard is the planet itself, and whose chessmen are the Governments and the Peoples.

This power is not occult; it rules by the manipulation of familiar machinery and by the exploitation of the most common motives known to humanity. If it has remained unknown until now, there is probably good reason for it. It may be possible that the people could not have grown strong enough and wise enough to cope with it until they had passed through centuries of experience of it. And it may be that the reign of this hidden super-government was necessary to give the world for all time to come an object lesson in the utter futility and failure of evil.

This power is financial and political. Not financial in the national sense, nor political in the governmental sense, but controlling the international gold which is placed here and there as policy requires, and controlling political procedure by causing to occur here or there an incident by which to affect affairs yonder. Heads of governments, of course, indignantly deny that there are heads still higher than they. But they will not deny that what they do is conditioned upon what someone else does; and while it may be impossible offhand to bring pressure to bear upon the personnel of a government to do a certain thing, it always is possible to spring an event elsewhere which will create a condition which will compel a government to act in a certain way. What one government does depends upon what another government does, and what the other government does may depend upon what one man, a private citizen or an international banker, does. Undoubtedly even the governments are wise enough now to make the movements of International Financiers a matter of secret service interest.

The greatest blow that could have been struck to the hidden government of the world would have been the early conclusion of the war. The holocaust had to rage a certain length of time to permit them a sufficient 'turnover" on their investment. As it was, the awakening of the people of the United States nipped as neat a plan as ever was devised, and as a result some of the international war profits are not collected yet, and never will be collected if the people of the United States keep their vision. There were persons interested in the Peace Ship's venture who could have drawn a chart of the then future, and the chart would have been exact. We know enough now to know that wars never "break," they are a matter of long and careful preparation.

But enough knowledge slipped out of the bag during that period to spell the doom of the inhuman type of International Finance. The facts are out, and although the world must necessarily receive them slowly, they are here to be received. The minds of the people are piercing through the clouds of mist which have enshrouded them. They are beginning to see that their economic and political experiences are not like the weather, uncontrollable, but that up above them and above the governments, in regular session, are a group of men, most of them representing families that have held the international reins for years, and these men decree what shall be. And whoever loses, they will win—that is, they will win until the system that permits them to win is crashed to the ground.

That system is going now. That is what International Finance means when it cries, "Save civilization"—it means, save the system by which we kept the peoples in our power. But that system is doomed, it is passing, and perhaps the Peace Ship was one of the first indications that its end had come.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Has Supreme Court Usurped People's Power?

Court Now Supreme, Congress Must Act, Says Senator

By U. S. SENATOR LADD

SENIOR SENATOR FROM NORTH DAKOTA

The second article by Senator Ladd on the Supreme Court will appear in an early issue.

THE Supreme Court of the United States is today more under scrutiny and discussion on the part of all the people, perhaps, than ever before. Evidences are cumulative that this question is gathering great momentum. And why shouldn't all the people be profoundly interested? "Laymen" have as much right to be interested as the so-called "authorities." This greatest judicial tribunal in the world is vital to the very existence and the happiness of 110,000,000 Americans. No nine human beings in the world have such powers as the learned and honored men who sit on the Supreme bench, in their court chambers in the United States Capitol Building midway between the chambers of the United States Senate and the House of Representatives.

The Congress may enact laws and the Executive, or President, complete the legislation by signing the bills, but a Supreme Court decision can annul both Congressional action and Presidential approval.

The Supreme Court, of course, will not lift its hand, of itself, to set aside or nullify any Act of Congress, until importuned to do so by some one interested. Sometimes the motives may be prompted by high purposes, but often they are selfish. Certain groups, particularly the big corporations, have well-paid permanent lobbyists in Washington watching every move of the President, of Congress and the Supreme Court. These representatives of the powerful corporations are often men the people have honored with high positions, such as seats in the Senate or House of Representatives. The voters sent them to Congress. Once they represented their constituents, but now they are representing their clients. They learned all the tricks and the intrigues of the legislative routine and are experts in guessing out what the Supreme Court would be liable to do in any given case.

A Growing Scrutiny of Supreme Court

IF WHILE in Congress a member has adopted the "right brand of politics," from the standpoint of the predatory interests, he is almost certain to be offered a position, as legislative and court representative, at a salary or fee that will be very tempting. Particularly this is the case if he is a lawyer by profession. Had such a man never held high political position the big interests would not want him.

These former members of Congress have access to the floors and cloakrooms of Congress that are denied the ordinary individual, and have more prestige in the chambers of the Supreme Court than "laymen." They also have a social standing which their official position naturally gave them. They meet, in a social way, the highest officials from the President and the judges of the Supreme Court down.

As a layman this question of the Supreme Court impresses me as one of the most serious problems now facing the American people. I refer to what is generally spoken of as the usurpation of power by the Supreme Court of the United States. I am not a lawyer, but it has been my misfortune to have been forced into court on a great many occasions, and feel that I can speak as a layman from some practical experience and observation.

We cannot help but take notice of the fact that there is a growing unrest among the people, and an increasing fear that the Supreme Court is assuming functions and powers that are alarming and not contemplated in the provisions of the Constitution. It is not so much the fact that the Supreme Court is assuming these powers, as the feeling that is abroad among the people that these powers are being used against the best interests of the people, that so seriously concerns us.

We are now fast drifting to that point of public discontent aroused by assumed abuses of usurped power, as the masses maintain, and an overwhelming demand with an aroused public sentiment will, I fear, swing the pendulum too far in the other direction.

I feel, therefore, justified in calling attention to the matter while there is yet time for carefully considering the demands for real justice to be done by again returning to the spirit and purpose of our Constitutional government.

Court Now the Supreme Power in the Land

IT IS becoming a rather common thing now to hear the intimation that the Supreme Court is being filled with corporation lawyers and the representatives of big business. Even a standpat and reactionary Senate has at times viewed, with some hesitancy, certain of the Presidential appointments to the greatest court in the world. The question has been repeatedly raised as to how Congress can respond to the will of the people by placing an act upon our statute books so that it may stand as the law of the land, unrepealable by the Supreme Court.

To my mind, as a layman who has given a great deal of thought to the subject, the remedy is not as difficult to obtain as our cautious lawmakers—awed by a sense of dominating power—are prone to believe. I believe we have the power to curb the undesirable tendencies of the court right in our grasp. It will take a little courage and determination to enforce the rights of the people, but if the Supreme Court has made any usurpations *we can settle that matter definitely in a time no longer than it takes to get a bill through both branches of Congress, and signed by the President. It has been done before and the Supreme Court has recognized the right of Congress to do it.*

There is no question in my mind that the Supreme Court has *usurped* the power to declare an Act of Congress to be unconstitutional. Legislative enactments have been declared void by this great tribunal. I believe such an exercise of power to be a dangerous usurpation of a legislative function. Universal experience has been that power usurped in any branch of government has proved to be power dishonestly and corruptly used.

In support of my belief that the exercise of this power to declare an Act of Congress to be unconstitutional is an unwarranted usurpation, it might be well to direct some attention to the origin of our political system. Prior to the adoption of the Federal Constitution, it is evident that the power of the states was supreme, sovereign and unlimited. But "in order to form a more perfect Union," they delegated a portion of it to the Federal Government clearly specifying that which they delegated and withholding all the rest. The Federal Constitution confers upon the Federal Government certain powers expressly enumerated; the constitutions of the states contain a general grant of powers not excepted or prohibited. The Federal Constitution is a grant of powers; the state constitutions are limitations of powers.

In the face of these well-established rules of interpretation it is pretty hard to understand how the Supreme Court of the United States could take to itself the right to exercise a power not expressly conferred by the Federal Constitution. There is no question that the power is not expressly conferred, and it should be equally unquestionable that the power cannot be derived by necessary implication. It strikes me as being somewhat pertinent, that the power to declare an Act of Congress void and null by reason of its repugnancy to the Federal Constitution was not exercised during the 16 years that the Federalists had control of the government and that it was not until the Republicans assumed control of the government that the Federal judges ventured to proclaim the power and exercise it.

All Government Agencies Not Authorized

I FEAR that we have been more or less burdened with legal wisdom. Perhaps the layman's view may not tally up to all of the gymnastic possibilities of the legal method, but it may serve to simplify the arguments relating to the means which the people possess for the safeguarding of their rights. There has grown up in our governmental system a feeling of awe, amounting almost to fear, of agencies of government that are supposed to be the instrumentalities of the people—*and which are not.*

No doubt, the first impulse of the judicial mind would be to spring to the defense of any questioned power of the judiciary. The argument might even be adduced that regardless of what the fathers of the Constitution may have had in mind, and regardless of whether or not the Constitution gave the express right to the Supreme Court to declare an Act of Congress to be unconstitutional, such a power was implied, and, if not implied, that such power has been exercised for so long that the people of the land have accepted it as the law and, therefore, it is the law.

Such a reasoning would but lead to the conclusion that our constituted authorities would only have to usurp power often enough and over a sufficient period to make those powers theirs by right. Such reasoning must shock the moral conscience of the nation.

Of course, I am fully aware of the fact that great legal minds may arise and say that the Senator from North Dakota is rehashing an old argument, and that the question has been settled against him, and that he shows his ignorance of the situation by adducing such argument. But I maintain that it is not an absolute requisite that a man be a lawyer to understand some of the simple language in the Constitution. It matters not if the Supreme Court has usurped this power, and if they have exercised it for a long period of years, that fact does not mean that they now have the power. They can only have it by the sufferance of Congress. It was never intended they should have.

Court Is Not Responsible to Anybody

IT WAS intended that the Congress should be the supreme branch of government, and that the Congress would have to go back to the people and report every two years. Any other conclusion would be an assumption that the people had wilfully relinquished control of supreme functions of government and placed those functions in the hands of a few men who were not directly responsible to the people. Under the Constitution, Congress alone should determine whether or not a proposed Act was constitutional. As the member of the House or the Senate decides on any such question that might arise, just so will his record go back to the people as his report, and they will decide whether or not they approve of his course. In this way the people can give expression every two years.

This was, in my humble opinion, the real intent of the framers of the Constitution. *What chance does the citizen have to rebuke the Supreme Court of the United States?* The fact that Congress has been asleep on its duty and has not zealously guarded this great power, and has not insisted that the Supreme Court function only in its intended sphere, does not mean that the people have lost that right, and that a growing despotism shall be enthroned. If this Congress will pass a new judiciary act, defining the powers and rights of the Supreme Court, and declare in that act that it shall not hereafter have the power to declare an Act of Congress unconstitutional, the people of this great land will arise and support them in such a measure, and the Supreme Court of the United States will not dare challenge that right. Should it attempt to do so, then it would be the solemn duty of Congress to proceed under the Constitution to dissolve the court that attempted it and constitute another one to take its place.

The Washington Memorial: a Shrine for the Ages

Concluded from page 2

we come upon the Washington-Wood Memorial, consisting of the pulpit, lectern, and perclose, all of Indiana limestone. It was dedicated on Washington's Birthday, 1909, when for the first time in history a representative of the King of England made an address at Valley Forge, in the course of which the speaker styled the chapel the American Westminster.

On Easter Day, 1912, was dedicated the Washington-Burk Memorial, given in memory of the late Abbie J. Reeves Burk, wife of the man whose life-work the completion of the memorial has been. The memorial is the bronze statuette, "Valley Forge," pronounced the finest statue of Washington since Houdon's in the capitol at Richmond.

Beyond the pulpit, perclose, and lectern is the choir. Each of the choir stalls, beautifully designed and marvelously executed, commemorates a brigade at Valley Forge. Continental soldiers, carved in oak, with their uniforms correctly colored, stand in the niches.

Over the stalls are the Flags of the Revolution, silk reproductions of the flags carried by the Continental troops. To provide fresh flags from time to time, and to extend the influence of Valley Forge, a flag fund is planned, the income of which will go for the purchase of new flags, the old flags then to be sent in rotation to the governors of the states to be distributed to the public schools, so that the flags which have hung in the chapel will eventually hang in the schoolhouses of the country.

The Memorial Organ, given in memory of a lieutenant in the Continental army, was formally dedicated in 1917. So wondrous seemed the music to one listener that he has suggested that some public-spirited citizen establish a perpetual endowment to provide an organist who shall, for an hour a day, unloose its sublime strains —a spiritualizing force in this material world of ours.

The altar is a single block of Indiana limestone weighing 10 tons. In its face is set the plate from Washington's overbox, which fell on the floor of the vault and was overlooked when the sarcophagus was sealed. It bears this brief inscription:

GEORGE WASHINGTON

BORN FEBRUARY 22, 1732

DIED DECEMBER 14, 1799

And cut in the steps leading to the altar we read Tennyson's stirring lines:

> "His work is done;
> But while the race of mankind endure,
> Let his great example stand
> Colossal seen of every land,
> And keep the soldier firm, the statesman pure,
> Till in all lands, and thro' all human story,
> The path of duty be the way of glory."

Most interesting are the six stone sedilia, or clergy seats. With their richly carved canopies they commemorate Washington's rectors and thus tell of his religious life.

By far the greatest glory of the chapel is revealed in the memorial windows, which are made in red and blue tones, so that, with the white walls between, the national colors are shown. "Created in the style and with the long-lost spirit of the world-famous windows of Chartres Cathedral they entrance the eye and inspire the soul." The artist, Nicola D'Ascenzo, of Philadelphia, has, through them, expressed this theme: The great window over the altar represents Christ filling all life and giving to men the fuller life; the window to the left narrates the carrying of the Gospel to the nations; over the pulpit will be a window representing the new birth seen in the freedom of thought, and, over the lectern, one showing the freedom of the Bible. Then follow the windows of Discovery, Settlement, Expansion, Development, Revolution, Patriotism, Democracy, and Union; and the last window, over the entrance, depicts the union of all these influences of Religion, Literature, Art, Science, and institutions in the greatest American, the Father of his Country. As in the other memorials, the windows carry, in most cases, a double commemoration, honoring such patriots as Franklin, John Paul Jones, Hamilton, Jefferson and Wayne. In the thirteenth—the George Washington Window—an attempt has been made to picture the life of Washington as the ideal American. This is done in three stages: Washington the Virginian, Washington the Patriot, Washington the American.

The crowning glory of the chapel is the Roof of the Republic. The trusses are supported by carved oak angels with outstretched wings, and, for each state, there is a panel in which the arms are carved and colored.

If I Could Have Served a Term in Congress

Mrs. Felton, Aged 87, Senator for One Day, Shows Old-fashioned Wisdom

By CLAIRE GILES

MRS. REBECCA L. FELTON

A woman of many activities, she hoes her own garden at Cartersville, attends to a 600-acre farm, and rode horseback until she was seventy. She was appointed by the governor of Georgia to fill the unexpired term of Senator Watson, and was seated by the U. S. Senate and served one day through courtesy.

ASKED if she didn't think that she could have been elected to the United States Senate as easily as appointed by the governor of Georgia to fill the unexpired term of Senator Watson, Mrs. Rebecca Latimer Felton replied: "No, my age is against me. I have not the vitality to wage a political campaign. And, besides, my mission is accomplished—I have blazed the trail for the serious entrance of women into politics in America at the very fountainhead, where they are most needed. The conscientious women of America will carry on the work long after I am gone."

Had it been Mrs. Felton's privilege to serve a term in the United States Senate, instead of serving by courtesy for one day only, there are some definite things she would have sponsored. She would have supported the Monroe Doctrine, and she would have opposed the League of Nations. "We must keep out of complications in Europe. We can't bear the burdens of the world any longer. If the Democrats adopt the League as a plank in their platform two years from now, they will be defeated," she says.

"Our bankrupt laws are too lax. I should have made an effort to have them made more rigid. There is a positive weakness in some sections for going into bankruptcy. The law should be changed so that any person who takes bankruptcy must account for any property he may have disposed of for a definite period beforehand."

Dishonest Judiciary a National Menace

MRS. FELTON does not believe in a national law strictly prohibiting divorce, although she feels that divorce laws are much too lax—that there should be some effort made at uniformity of the divorce laws of the states. She thinks that provision should be made by all means for a woman's being able to get a divorce from a worthless husband for the sake of her children.

"I should have worked for a thorough revision of our election laws," she continued. "We need (especially us women, who are new to the game) thorough and systematic instruction as to our duties as citizens that we may be able to do some telling work here where it is vitally needed. A dishonest judiciary and dishonest elections will always be a stumblingblock in a republic. We have both now, and it is a common practice for men to buy their way into politics. The English judiciary is above reproach. In America political influence can keep a man out of jail no matter how guilty he is.

"No man should be allowed to run for office until he is willing to issue a printed and signed statement as to what he intends to do when he gets in (he can always say the newspapers misquoted him). This should be kept by conscientious voters and a regular checking up made at regular intervals, so that he can be brought to task. The referendum and recall? There should certainly be some system for compelling a man in public office to render the duties of his office in a satisfactory manner if he expects to stay in it. Yes, there should be some form of impeachment for public officials.

"How Terrible 'Personal Politics' Are!"

"AND no judge should be 'promoted' to the Senate. He should not be allowed to enter a political campaign until he has washed his hands of his judicial duties. The responsibilities of his office are much too great to make this a safe procedure. Favoritism and factionalism and prejudice mixed up in politics invariably cloud the issue. I have often noticed in speaking in small communities how terribly *personal* politics had become. One set of men would advocate a certain measure, and the other side would come out in opposition. The bulk of the people would know practically nothing of the real issues involved (the merits of the proposed legislation, and its effects upon the lives, homes, children, or the town's coffers). But the whole town would line up—how? According to their friendliness or unfriendliness of the *individuals* on either side!

"Mind you, I am talking of politics before women had a vote, too! Yes, the measure would be voted for or against, according to the amount of prejudice, personal animosities, old grudges and friendships that could be stirred up, with no serious thought as to its worthiness." This method, elaborated, is still in force in our national lawmaking body today!

"When you come to think of it, we have only had about 116 years of government as a republic. We are hardly out of adolescence. In this time we have spent about all our surplus money on wars. And we are not through with them yet. The East is always a seething vessel of dissension, England's domination of India is kept down by force, and the other countries of Europe seem to be itching to get into war again. When you get a big, restless crowd of one mind, the mass feeling is like a great suck pool—anything can happen. And the race question in this country is by no means settled.

"The results of our efforts at reconstruction are not encouraging. I have seen reconstruction after the Civil War, and of that time and this I believe this is the worst. The reason is largely psychological. Then the South was almost devastated. Nobody had much, and many had nothing at all. So everybody went to work with a will and a determination to come back. You don't see much of the spirit that wins now. People are restless—are not willing to get down and dig for things. They seem to want to live off the public treasury—want soft jobs."

What She Said to President Harding

REFERRING to her talk with President Harding when she was called into conference with him in Florida last winter, she said: "We had a long talk about domestic problems. I told him that once every four years we got a great political hurrah at the end of the campaign, and that was the end of it, and I wanted to see the time come when the South would have a fair showing. Mr. Harding promised that so far as lay in his power the South should have it."

When asked what southern women thought about political matters, Mrs. Felton told the President that most of them were new to politics and had much to learn, and it would take a lively election to stir up their interest greatly.

"Another of our great national weaknesses is law enforcement. When you have lived as I have through a period (referring to the Civil War) when there is no law, you know what it means to have no court of law where you can make an appeal and be sure of a hearing. It is a terrible thing. You live in a nightmare of fear, and go to bed at night feeling that *anything* can happen before morning. When you have lived through that you will have a greater respect for law—and for law enforcement. Better the enforcement of an imperfect law than to have good laws that are not enforced. It is so with our prohibition laws—the great weakness lies in their lack of enforcement."

Mrs. Felton is at times accused of being a Republican. She says: "I am an independent Democrat. I think there is too much sentiment and tradition in the Democratic party and not enough common sense for one to be absolutely bound to all that it does. I find good in both parties." Fair-minded she first took up her pen in defense of some northern prisoners in a Richmond prison during the Civil War who were not getting the treatment they should have had. And she has been sponsoring the under dog and championing the cause of right ever since.

"My being seated in Congress for one day was not a romantic incident but a historical event. Georgia was very slow in her promise with reference to suffrage, but she has been rapid to perform. I believe my having been admitted is a milestone for women, and no one can tell when the unexpected will happen again. The tide is setting strongly toward better treatment for women all round. I thought when I saw Miss Rankin seated how much we really owed to the men after all, for they gave us the vote. We should forget old antagonisms, and work hand in hand. I hope many women will have seats in the United States Senate during the years to come. You know the first lady member of Parliament was a Virginia woman." Mrs. Felton told the Senators in her speech in the Senate: "When the women of this country come and sit with you, I pledge you that you will get ability, integrity of purpose, exalted patriotism, and unstinted usefulness."

A Career of Usefulness and Dignity

MRS. FELTON has been a prominent figure in Georgia politics for half a century, and for 25 years she has been a national figure. A prime mover in every bit of constructive legislation enacted in the state for years, she has helped to blaze the trail in pioneer paths in causes which, now taken for granted, were once "fields of stressful controversy."

She traversed the state speaking for temperance in 1886; was an early suffrage advocate, for 20 years on the stump and in public journals and before legislative committees; was campaign manager for her husband, Dr. Felton, when he was a candidate for the state legislature and for Congress, where he served from 1875 to 1881. She is an honor graduate of Madison Female College (1852), and received an honorary degree of Doctor of Letters from the University of Georgia in 1922; was a delegate from Georgia Agricultural Department to the Tennessee Centennial Exposition in 1887; on Board of Lady Managers of the Chicago Exposition, 1890 to 1894; Chairman Woman's Executive Board Cotton States and International Exposition in Atlanta in 1895; juror on General Agriculture, St. Louis Exposition in 1904. She was the first woman to appear before the Georgia legislature; was a charter member of the National Woman's Party, supporting the party's campaign in Georgia for the passage of equal rights legislation by the state legislature, and has always been a firm advocate for complete equality for women.

Fifty Years of Service—87 of Life

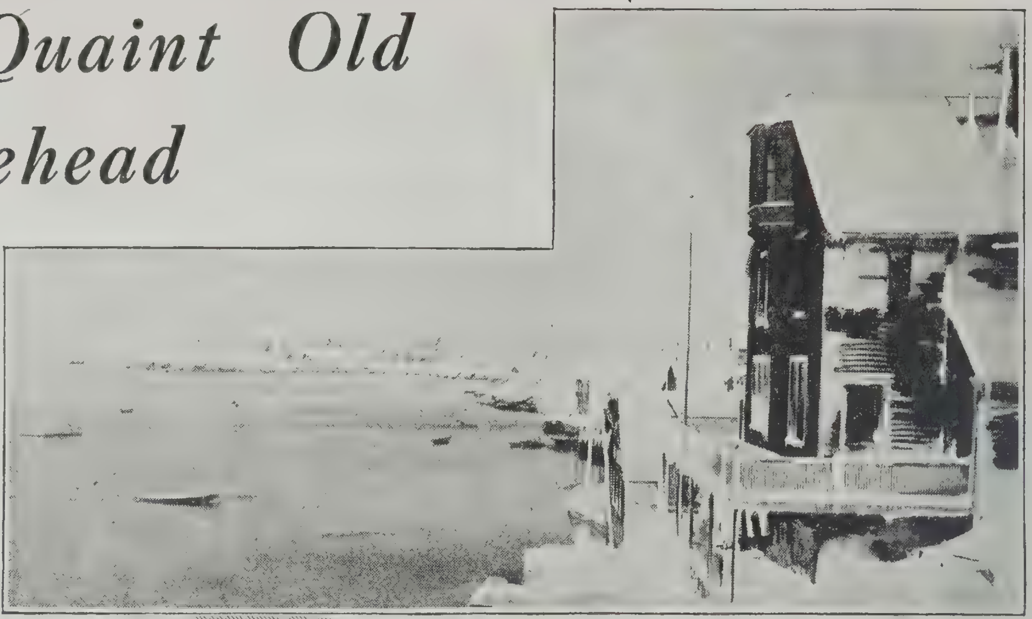
POLITICIAN, statesman, writer (author of two books on Georgia politics and contributor for 25 years to the *Tri-Weekly Atlanta Journal*), gentlewoman, homemaker, mother and grandmother, she should be a flaming signal to those who prate unthinkingly that "woman's place is in the home." If ability be an obligation, and service the badge of the great, Mrs. Rebecca Latimer Felton has won her medals. For 50 years she has served—and at 87 she continues to give unstintedly.

And of the true things which Mrs. Felton has said, her observations about an honest judiciary, too honest even to accept promotion, and her observations about political campaigns ending in "hurrah," are well worth serious consideration.

A Visit to Quaint Old Marblehead

Romance and Beauty of New England's Famous Headland Reflected in Its History

By MAY B. WHITING



The shore in winter.

The roofs of Marblehead.

THERE is no town like Marblehead, no place so topsy-turvy, unless Alice saw it in Wonderland. With plenty of open country about, the houses are huddled and jumbled together as if high tide had left them stranded, while lanes and streets, like rivulets, wriggle their way among them to the sea. Gambrel roofs, pitch roofs, and hip roofs jostle each other pell-mell. Perhaps a door faces the street, but quite as likely a corner, with a big stone set for a buffer, thrusts itself squarely into the highway. Sometimes a house is set on the edge of a cliff, beetling over the road like a caterpillar that has come to the end of the fence and reaches into the void. Some houses run up a hill so that the back door is two stories higher than the front; some slide down a ravine and blink at you darkly from its depths. No one but a sailor could be expected to "find the way."

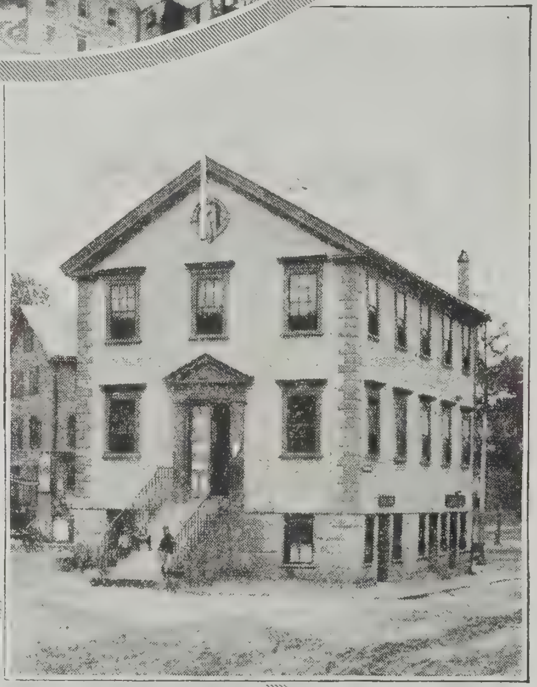
Just where the inhabitants came from and how they learned their speech and manners is a mystery. They were never part nor parcel of the Puritan civilization about them. For more than 70 years they got along without settled schoolmaster or parson. The preachers in the neighboring towns visited and exhorted powerfully but the people of Marblehead showed small concern for their souls' salvation. Their sailors were famed in every port, their merchants grew rich, trading alike with Mohammedan, Buddist and Parsee. In 1636 they launched the third ship built in the colonies, the *Desire*, which sailed to the West Indies and brought back the first slaves.

Those who stayed at home fished for the cod and dried enormous quantities which they exported. They lived to a prodigious old age, asking and granting no favors. If a stranger appeared on foot in the village it was the custom to "rock him round the corner," and, as Marblehead is all corners, he must have had a lively time of it.

"The place is noted for its children," wrote Captain Goelet in 1750, "and nourishes the most for its bigness of any place in North America; it is said that the chief cause is attributed to their feeding on Cod's head, and so on, which is their Principal Dish. It is in short a Dirty Erregular Stincking place." In 1776 John Adams wrote, "The streets are narrow and rugged and dirty, but there are some very grand buildings." Even Washington turned out of his way to see the town and commented in his diary on its quaint, dilapidated appearance.

And Marblehead was well worth visiting. In wealth and population it was second to Boston but as different as if 10,000 miles lay between. In its streets notorious pirates walked unmolested and traded their spoils. There were sailors in pigtails and earrings, gentlemen in periwigs, black slaves a-plenty, and ladies in their coaches. There were comfortable citizens in long hair, that abomination of the Puritans, who tried their best to induce their ungodly neighbors to cut if off.

Romance and adventure were in the very air. There were great goings-on at the Fountain Inn, where the richest merchants in the land did not disdain to tarry, although hobnobbing in strange company. It was at this same inn, already old in 1742, that Agnes Surriage scrubbed the stairs when Sir John Franckland, collector of the port of Boston, came down to supervise Fort Sewall. Agnes was a true daughter of Marblehead. During the earthquake in Lisbon she saved the young lord's life, and they were married and lived happily like the faithful lovers that they were.



The old Town Hall, built in 1727.

A typical Marblehead street.

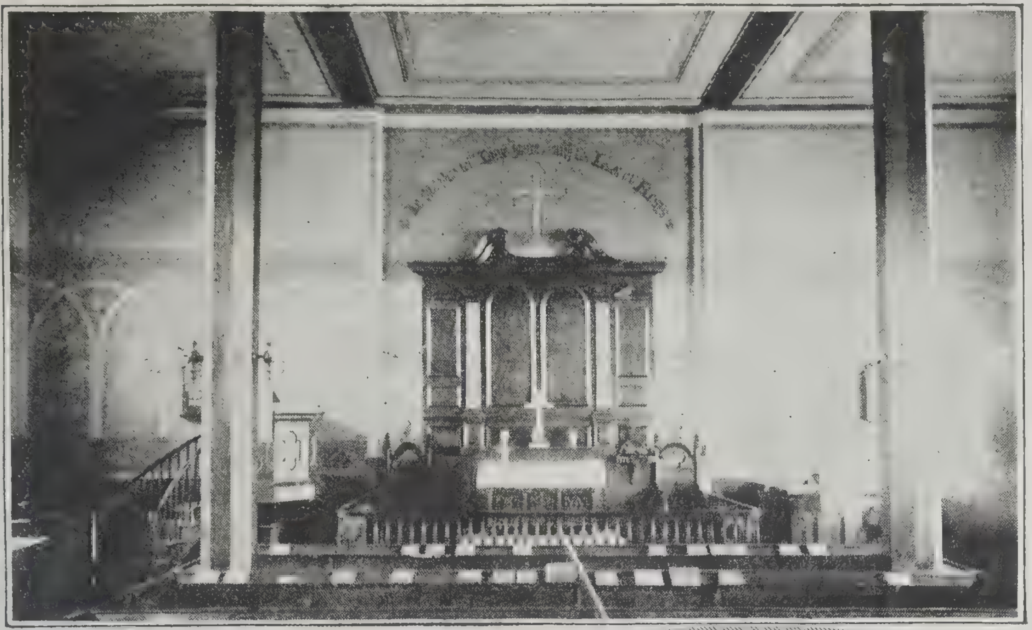
Marblehead had its own Robinson Crusoe. In 1704 young Philip Ashton was kidnapped by pirates. After many adventures he managed to conceal himself on a nameless, uninhabited island, where they stopped for water. He lived there alone for two years, when he was picked up by Captain Dove, of Salem, and six months later appeared in the streets of his own village, where all things are possible.

The town had a glorious history during the Revolution. When the port of Boston was closed, Marblehead was named as port of entry, but refused to profit by it. The citizens gave generous donations of fish and oil, and opened their warehouses for the use of the "distressed but respectable" men of Boston. The old Town Hall, built in 1727 and still standing, gained the name of a second Faneuil Hall, and Marblehead itself is called the "Nursery of the Navy." The first act of the Continental Congress instructed Commodore John Manley to protect the coast. He hoisted the first American flag, the pine tree of Massachusetts, and to him the first British flag was struck.

There was just a smatter of the pirate in those old sea dogs. In one year Commodore Samuel Tucker captured nearly 40 prizes. In 1776, when he conveyed John Adams to France, he could not resist the temptation of taking one more "just to keep his hand in." The town equipped and furnished 800 men, the famous marine regiment, equally valorous on sea or land. They were of great service to Washington when he crossed the Delaware and they led the advance at Trenton.

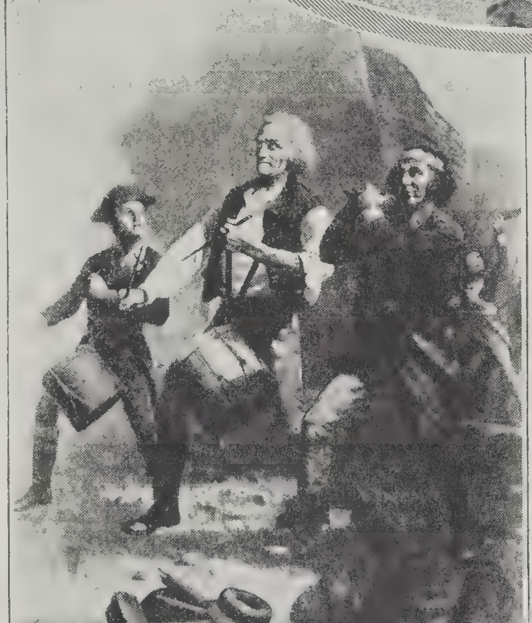
The Revolution left the town ruined. Its wealth was spent, its commerce ruined, its population greatly diminished. It was just recovering when, in 1812, war broke out, and at its close 500 men of Marblehead lay in English prisons.

It was just off the shore of Marblehead that the famous "duel" between the *Chesapeake* and the *Shannon* took place. Captain Lawrence, mortally wounded, re-



The ancient altar and pulpit of St. Michael's.

Marblehead Harbor.



"The Spirit of '76."

fused to allow the colors to be struck and his dying words, "Don't give up the ship," have become the motto of the Navy. One Sunday morning in April the watchers on the shore saw the frigate *Constitution* making in from the sea with two boats in pursuit. With all haste cannon were brought from Salem in case the fight should be near shore, but before the enemy could overtake her, *Old Ironsides* was safe under the protecting guns of Fort Sewall.

In the palmy days of her commerce, visiting captains were astonished that so thrifty a village should pay so little heed to things spiritual. Missionaries began to come over and the Church of England found staunch supporters. In 1714 Saint Michael's was begun, the oldest Episcopal church now standing in New England. Like all the more pretentious buildings, it was got out in England. Over the altar is the Decalogue, done in ancient lettering, and from the center of the nave hangs a brass chandelier, sent over in 1739 as a gift from the town of Bristol.

During the Revolution the church had a stormy history. Its pastor, Mr. Weeks, persisted in praying publicly for the safety of the royal family and the overthrow of the enemies of the crown. When Independence was declared the townspeople broke in, tore down the royal coat of arms and rang the bell until it cracked. But Mr. Weeks was a man of convictions. He continued his petitions with redoubled fervor until the Provincial Congress, thoroughly out of patience, ordered the church closed. Mr. Weeks then fled to Nova Scotia where he could say his prayers in peace.

The old church records bear interesting notes. One Ashley Bowen, fearing lest the Book of Common Prayer be destroyed, copied the whole volume by hand. At one time a door was cut in the side to accommodate a fat man, far too corpulent to enter an old-fashioned pew.

The church, with ancient pulpit, massive beams, and quaint chandelier, is strangely at odds with its surroundings. You climb a street that is little more than a succession of stone steps, with a hodgepodge of wooden buildings on each side; you step beneath the rather dingy portal and suddenly find yourself in the midst of beauty and faded grandeur. The contrast is as great as when, from noisome Old World slums, you enter a silent cathedral of the Middle Ages.

Another reminder of past glories is the Lee Mansion. Like everything else in Marblehead, it is crowded for room, for the "Sea Kings" liked to be near the wharves and custom house where they would wait for their ships to come sailing in. The mansion was one of the most elaborate and richly furnished in the colonies. Washington, Lafayette, Monroe and Jackson have been guests there. The entrance hall, five yards wide, runs the length of the house, with great windows in the rear letting in floods of light on rich mahogany casings and a noble stairway, six feet wide, with quaintly carved baluster and posts. At the left is the drawing room, wainscoted from floor to ceiling in black walnut, with elaborate carvings and deeply recessed windows.

One of the strangest stories of Marblehead, with the haunting tragedy of fate, is that of poor Flod Ireson. For many a year the "chant of Flod Ireson" was current in the village. Small boys used to shout it after him, as, a bent and broken old man, he peddled fish up and down its tortuous lanes. It ran

"Old Flod Ireson for his horrd horrt
Was torr'd an' furtherr'd an' corr'd in a corrt
A becos he left five men on a wrack
Was torr'd an' furtherr'd all over his back."

Ireson was skipper of the schooner *Betsy*, which, on the way home from the West Indies, sighted a wreck off Cape Cod. The sea was running heavy, so the skipper gaye order to "lay by" till morning, then went below. The crew, a disorderly set, unwilling to delay their own homecoming, disobeyed. The next day a Provincetown boat picked up two men from the wreck and landed them at Marblehead where they accused Ireson of cowardice. The townspeople, incensed at this crime, the blackest in the annals of seafaring folk, seized the unfortunate skipper, gave him a coat of tar and feathers, and dragged him through the streets. Whittier depicts the scene:

"Scores of women, old and young,
Strong of muscle and glib of tongue,
Pushed and pulled up the rocky lane,
Shouting and singing the shrill refrain:
Here's Flod Ireson, for his horrd horrt
Torr'd and furtherr'd and corr'd in a corrt
By the women o' Morble'ead.' "

The people of Marblehead never quite forgave the poet for immortalizing the story of that dreadful night or for perpetuating their dialect. Even today the name of Ireson is taboo. The villagers will not talk of him nor direct a stranger to his house. As for the part the women played, the ballad is not contrary to the traditions of Marblehead.

Away back in 1677 Increase Mather wrote in a letter to Mr. Cotton:

"Sabbath-day was senningt, the women of Marblehead, as they came out of the meeting house, fell upon two Indians that were brought in as captives and, in a tumultuous way, very barbarously murdered them. Doubtless if the Indians hear of it, the captives among them will be served accordingly."

Those were tumultuous days and life a colorful drama, too often a tragedy. Most of the actors lie sleeping on Burial Hill, huddled together in death, as in life, without regard for order.

The lot dates back to 1638, and even in those days visitors wondered at its choice, for, with granite ledges thrusting up at every turn, it is only in nooks and crannies that there is to be found lodging for the dead.

In the fine new Town Hall is the deed by which the colonists bought the land, signed by the Indians by rudely drawn pictures of animals. Another of its treasures is "The Spirit of '76," the most popular patriotic picture in the country. The artist, Archibald M. Willard, went through the public schools of his own city of Cleveland to find a model for the drummer boy, and, by chance—or vision—picked out a lad of Marblehead ancestry, whose great-great-grandfather served in the famous Brigade of the Revolution. The picture was put on exhibition at the Centennial and General Devereux, the father of the boy, bought it and presented it to Marblehead. The artist later painted a replica for Cleveland.

The Lee Mansion, built in 1768.

Shall Rosenbluth Be "an American Dreyfus"?

Attempt of Propagandists to Use Influence of Colleges

By CHARLES ALBERT COLLMAN

SOME eight years ago, heads of the same organization that are now trying to prevent the trial of Robert Rosenbluth, were bending their efforts toward defeating the law in the case of Leo M. Frank, on trial at Atlanta, Georgia. Then, as now, technicalities were interposed to delay court proceedings, witnesses were tampered with and alleged "retractions" obtained. Then, as now, the name of a large university was utilized to mold public sentiment in favor of the prisoner. Publicity bulletins periodically announced that "Cornell University Alumni" were pleading for Leo Frank and signing petitions on his behalf.

For the last few months, stories have appeared in newspapers, bearing headlines such as "Yale Men Appeal for Captain Rosenbluth," or "Yale Men Back Rosenbluth." They are in the form of special dispatches to certain New York dailies, which generally publish them as offsets to new developments in the Rosenbluth case. They spread the impression that a great American university sympathizes with one of the men charged with the murder of young Major Cronkhite.

Yale graduates have expressed deep concern and indignation over these attempts to drag the name of their *alma mater* into the Rosenbluth case, representing her as vouching for the innocence of a man as yet untried, and arraying her on the side of elements which are circulating defamatory stories concerning an American Army officer and his slain son. It was in the desire to obtain the true sources of these dispatches, that I recently paid a visit to Connecticut's university town.

On my arrival in New Haven, I learned that the correspondent who sends out the "news specials" usually quotes Professor Herman Haupt Chapman, of the Forest School, which is one of the minor branches of Yale. The same day there came into my hands a folder which has been circulated rather industriously, containing the reprint of an article which appeared in the January number of the small bulletin published quarterly by the Forest School's alumni association. It was edited by Professor Chapman, who is secretary of the association.

The subject matter of this article is based entirely upon extracts from the pamphlet entitled, "Exoneration of Captain Rosenbluth," which has been mentioned before in these chapters as having been published and circulated by the Rosenbluth propaganda. The contents are probably familiar to the reader, as they have been printed widely during the last two years in newspapers such as the New York *World*, New York *American*, Tacoma *Ledger* and others.

Rosenbluth Not a Graduate of Yale

THIS "exoneration" pamphlet consists for the greater part of copies of letters addressed to Rosenbluth, and affidavits gathered by his attorneys, Goldstein & Goldstein. **It is sponsored by Mr. J. W. Selden, prosecuting attorney of Pierce County, Washington. Mr. Selden has never had an opportunity of examining the more than 70 witnesses who appeared before the Federal Grand Jury in Washington, and on whose testimony that body indicted Rosenbluth and Pothier for premeditated murder. Nor has he had any explanations from Rosenbluth of the many contradictory statements made and sworn to by him regarding the death of Major Cronkhite, of which he and Pothier were the sole witnesses.** Naturally, it is beyond the power of a district attorney **to exonerate an indicted man. This can be accomplished only by a court decision, or the verdict of a jury.** Persons who may be curious to examine this pamphlet, can obtain copies free of charge by addressing Rosenbluth's attorneys, Goldstein & Goldstein, counselors-at-law, 366 Broadway, New York City.

This presentation of Rosenbluth's case from the standpoint of his counsel, in the Forest School *News*, is concluded with the following notes and signatures:

A reprint of a pamphlet containing the entire testimony published by Prosecuting Attorney James P. Selden, of Pierce County, Washington, may be obtained by any alumnus from the secretary on written request and remission of 30 cents net cost. Stamps accepted.

It is our intention to present definite plans for further action to our alumni as soon as these can be formulated.

Signed
Samuel N. Spring, '03, President
Barrington Moore, '08
Samuel T. Dana, '07
Walter K. Wildes, '10
Herman H. Chapman, '04, Secretary
Constituting the Executive Council of the Alumni Association of the Yale School of Forestry.
Henry S. Graves, Dean
James W. Toumey
Ralph C. Bryant
Samuel J. Record, '05
Ralph C. Hawley, '04
H. N. Whitford
H. H. Chapman, '04
Constituting the faculty of the Yale School of Forestry.

On calling at the Forest School building, situated on grounds in Prospect street, New Haven, I visited the office of Professor James W. Toumey, former dean of the institution, whose signature is included in the above list. Professor Toumey first acknowledged a vague impression, which I have found shared by many persons, that Robert Rosenbluth **had been tried repeatedly and acquitted.** However, when I broached the subject of the article published in the Forest School *News*, he exclaimed: "Oh, I don't know anything about the Rosenbluth case. Chapman is the one who started that. He goes up in the air about everything in the same way," he added, with a good-natured laugh. "But I don't think Yale or any other institution should come out expressing a belief in the innocence of an indicted man. Everybody should keep his hands off and await the outcome of the trial."

Professor Toumey advised me to see his colleague, and so later I had a talk with Professor Chapman who, indeed, manifested an unusual degree of interest in the Rosenbluth case, and admitted that he was really devoting more time to the subject than he should.

It appears from my inquiries that Rosenbluth, contrary to an impression sought to be created, *is not a graduate of Yale University at all. Sixteen years ago he merely took a two-year course in the Forest School,* and for this reason, quite human in itself, persons identified with the school feel bound to show him their sympathy.

I asked Professor Chapman whether he thought it wise in the circumstances that a false atmosphere should be created by the publication of stories implying that so prominent an institution as Yale was supporting a belief that the Department of Justice was trying to make "an American Dreyfus" out of Rosenbluth.

"Is the writer of an article responsible for the headlines in a newspaper?" he retorted.

I replied that if the context contained the implication, the writer was generally held at fault.

When questioned as to how he had first become interested in the Rosenbluth case, Professor Chapman explained that it had come about through his reading copies of the Tacoma *Sunday Ledger* of December 11, 18, and 25, 1921, which had been sent to him by an alumnus of the school. After considering the matter, he and Messrs. Spring, Moore, Dana and Wildes, comprising the executive council of the alumni association of the School of Forestry, had drawn up resolutions expressing their belief in Rosenbluth's innocence.

"Then in this you do not speak for Yale?"

"No, only for the Forest School alumni. We have from 500 to 600 members, to whom we sent the resolutions, and we did not receive a single objection to their publication."

"You have referred to a series of stories published in the Sunday Tacoma *Ledger*," I observed. "They were, as I understand it, reprints of the material contained in those pamphlets," and I indicated a pile of the yellow-backed "Exoneration" booklets, heaped on the window ledge beside the speaker.

"Yes," replied Professor Chapman. "They represent the official report made by Mr. J. W. Selden, prosecuting attorney of Pierce County, Washington. His opinion was considered so complete and convincing, that the executive council and the faculty of the Forest School were no longer in doubt as to the facts in the case. They never at any time doubted Rosenbluth's innocence."

"Then those are the pamphlets to which you refer in your notice in the Forest School *News*, offering to send them to any alumnus on receipt of 30 cents net cost? Do you know by whom they are being printed and circulated?"

"I don't know who printed them," he replied, "but I would have published them myself had that been necessary."

"Professor Chapman, will you tell me who provided you with those pamphlets?" I asked.

After a moment's hesitation the answer came: "I got them from Robert Rosenbluth." He added, "But I paid him for every one of them."

Professor Chapman's Defense of Rosenbluth

I THEN propounded a question to him. "Professor, if I had been indicted for murder, and came to you, alleging that my prosecutors were trying to blackmail and frame me, and presented you with the material for my defense, would you, without having heard a word from the side of my accusers, feel yourself justified in taking up my cause and pronouncing me innocent?"

"But this is original evidence," heatedly maintained the professor, as he tapped his fingers on the exoneration pamphlets. "It is authoritative and official."

"Have you read the decision of Judge Brown, of the United States District Court of Rhode Island, holding that the government has jurisdiction over the land at Camp Lewis on which Major Cronkhite met his death?" I inquired.

"No, I have not," he admitted.

"Do you know Mr. John E. Jenks, one of the owners of the *Army & Navy Register*, of Washington, D. C.?"

"Yes, I do."

"You communicated with him on this Rosenbluth matter?"

"Yes, why shouldn't I?" he retorted, rather resentfully, I thought.

The results of Professor Chapman's communication to Mr. Jenks, and its bearing on the Rosenbluth case, will have to be reserved for another chapter.

In the issue of the Forest School *News* of last January, Professor Chapman prints a defense of the attitude of Rosenbluth, which I herewith reproduce in full, as an exposition of his viewpoint:

SOME QUESTIONS ANSWERED

By H. H. Chapman

There are certain features of this case which tend to confuse the public and Rosenbluth's friends, all of whom are confident he is innocent. These are, why, after he was exonerated by Prosecuting Attorney Selden did the government reassert its jurisdiction and procure an indictment, and why, after persistent efforts to secure public hearing on the case, did he oppose extradition on the grounds of no jurisdiction. Superficial reaction would obviously tend to the opinion that there "must be something in it after all," hence for the information of our alumni I wish to make this statement, based on a thorough personal inquiry.

First, an indictment is not a trial or conviction, the proceedings of a grand jury are secret, and it is always possible to procure an indictment if the case is presented in such a way as to arouse any question in the minds of the grand jury as to the facts. Had Rosenbluth desired nothing more than personal exoneration, he would have been satisfied when he received it, in a most complete and convincing form from the authorities of Pierce County, Washington. The indictment then, in itself, is without significance; it gives the opportunity to try the case; that is all. A trial will reveal the existence or nonexistence of additional evidence and will thus settle this point, with all the significance it conveys.

Since, therefore, a trial would be of the greatest benefit to Rosenbluth, why should he oppose jurisdiction? The answer is, that Rosenbluth not only did not wish to oppose jurisdiction but insisted that under no conditions would he consent to such a course. But the legal aspects of the case, or technicalities, cannot be avoided. Since there exists an unmistakable doubt as to whether the government has jurisdiction, as shown by the former denial of jurisdiction over the Attorney-General's own signature, this case could under no circumstances proceed to trial until the courts had determined who was to try it. The Federal court itself, before which the case was presented, would be bound to raise the question, if it had not previously been raised and settled. The time to settle it was before proceeding to trial, and the place was in the district where the accused resides. Rosenbluth knew perfectly well what impression would be created by raising this question, as I happen to know at first hand, but he could not help himself.

Should it appear that the government has no jurisdiction in the case, the essential facts which were the motive for Rosenbluth's efforts for an investigation of the department's methods are greatly strengthened.

Action Shows More Heart Than Intelligence

EFFORTS to benefit the public by correcting abuses if such exist are almost certain to entail unpleasant and even injurious consequences to those who are willing to put forth such efforts. Rosenbluth having been in public service 15 years knows this perfectly well, and is willing to abide by the outcome.

The reader must judge for himself the value of the foregoing comments. Personally I can make nothing of them, except a statement that an indictment for murder by a Federal grand jury—the most important arm of a United States court—is without significance. *The jury that indicted Rosenbluth did so only after a solemn warning that it should not indict unless, sitting as a trial jury, it would also be ready to convict.* That Professor Chapman should champion the cause of a man because, years ago, that man was a student in the school which now employs Chapman, certainly does credit to the instincts of his heart, though in a lesser degree to his intelligence.

I had the opportunity of speaking with two more of Professor Chapman's associates in the Forest School, Messrs. Ralph C. Bryant and H. N. Whitford, and both felt quite assured of the extent of their knowledge of the Rosenbluth case.

"Yale is behind the defense of Rosenbluth," asserted Professor Bryant, amending his statement, however, by adding: "I can't speak for Yale, but I know many prominent men sympathize with him. I don't care to hear anything in addition to what I know. I believe a lot of people are trying to railroad an innocent man."

Professor Whitford spoke with similar assurance. "Rosenbluth," he informed me, "has been tried by a military court and acquitted, and the prosecutor at Washington has decided that there is no case against him and that he is innocent. Several criminal lawyers here have passed their opinion on the case. You, I take it, are not a criminal lawyer. No? Not even a lawyer? Well, Rosenbluth has been tried several times and acquitted."

Professor Whitford was evidently under the impression that the military board of inquiry into the death of Major Cronkhite had been a military court which had tried Rosenbluth. As I attempted to direct his attention to this error, he retorted: "How do I know you are telling me the truth?"

The question, of course, was unanswerable.

The professors of the Forest School are quite within their bounds if they choose to convene as a lay court, limited by the horizon of their classroom, consider *ex parte* testimony and evidence submitted to them by an accused, and render a finding of not guilty. Their opinion, on whatever premises found, remains an opinion and no more. A man is charged with murder; in his youth he once attended a two-year course at a forest school; but an alumnus of a forest school is incapable of committing a crime; *ergo*, the man is innocent; *quod erat demonstrandum.*

The situation wears a different aspect, however, when men whose sole spoken authority rests upon the reputation of an institution of learning with which they are identified, express untried opinions in a circular headed with the name of that institution, which is then utilized by other persons to throw discredit upon the United States courts and its jury system, hamper justice in its course, and with such illusory support encourage an element ever ready to undermine and weaken the basic forms of government.

The Last Carver of Totem Poles—His Masterpiece

Meaning of Strange Indian Art and Symbolism

By ROBERT H. MOULTON

POSSIBLY the last carver of totem poles is William Shelton, head of the Indian reservation school at Tulalip, Washington. The making of totem poles is an art and few nowadays are the men who can carve them. Shelton has recently completed an enormous totem pole which he regards as his life work. He spent more than 3,000 hours on it. It sets forth the family history of the Snohonish tribe of Western Washington, of which Shelton is a member. This pole is six feet in diameter and 84 feet high, and Shelton expects to spend most of his remaining years informing the world of the true meaning of totem poles. It is a large undertaking.

What is a totem pole?

Well, it would take a Philadelphia lawyer to figure it out and then he would have hard work to make the average man understand the true inwardness of totemism, totem and totem poles.

Totemism, the anthropologists say, is common to primitive man in many parts of the world, but is far from being universal. It is found among the American Indians, but there are tribes which show no trace of it. The Eskimos know nothing of it. Certain African savages have it. The Australians have it.

A totem is a class of material objects which a savage regards with superstitious respect, believing that there exists between him and every member of the class an intimate and altogether special relation. The connection between a man and his totem is mutually beneficent; the totem protects the man and the man shows his respect for the totem in various ways. If his totem is an animal he may show this respect either by refusing to kill and eat it or by making it his favorite diet.

Early explorers found the American Indian communities, independent of their local distribution into tribes, bands and villages, composed of several distinct clans. Each clan had its emblem, consisting of the figure of some bird, beast or reptile, as, for example, the clans of the wolf, deer, otter and hawks. In the language of the Algonquins these emblems are known as totems. Members of the same clan were prohibited from intermarriage; a man could take a wife from any clan but his own.

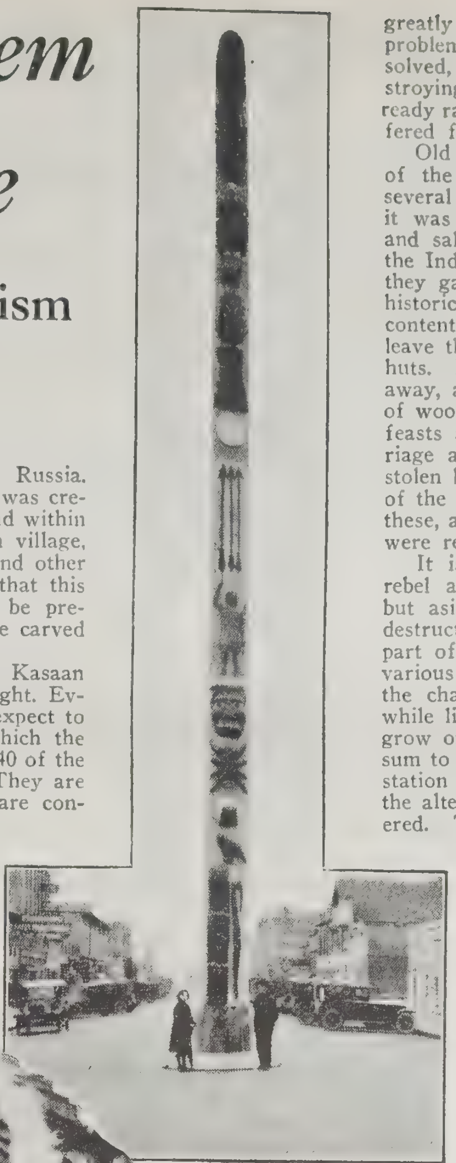
To different totems attached different degrees of rank and dignity; those of the bear, tortoise and wolf were among the first in honor. Members of the same clan, though they might dwell far apart and speak different dialects, were yet bound by the closest ties of fraternity. This kind of totem was found in at least three varieties: The clan totem, common to a whole clan and passing by inheritance from generation to generation; the sex totem, common either to all the males or to all the females in a tribe, to the exclusion in either case of the other sex; the individual totem, belonging to an individual and not passing to his descendants.

As to the totem pole, it is difficult to say what it is. There is one thing, however, which it is not; it is not a fetish or an idol or a thing to be worshiped. The totem pole of one man may be simply his individual totem. A second totem pole may also bear the clan totem of the owner. Then, a chief or a rich man may have an elaborate totem pole containing "all his crests and all the stories connected with them." So that a very large and pretentious totem pole may be a sort of family tree of the owner or even an autobiography. Even in case the carvers of totem poles become extinct, a number of the most noteworthy of these remarkable creations will be preserved for posterity for several generations to come. Uncle Sam realized quite a while ago the advisability of this. The result is that there are two national monuments in Alaska, created in large part with the view of preserving some very fine examples of these curious relics of bygone days.

Totem poles in Sitka National Monument.

Sitka National Monument was created in 1910. It is about a mile from Sitka and contains 57 acres. It contains 18 totem poles, the highest of which rises 60 feet. These totem poles are carved from red cedar and when the paint wears off the unprotected wood cracks badly. These totem poles have recently been given two coats of paint in six colors by the national park service. Where the carvings were broken or decayed they were replaced. This monument is a picturesque place and from it there is a panoramic view of beauty and interest as the scene of the massacre of Russian fur hunters by Indians in the early days when all this region was owned by Russia.

Old Kasaan National Monument was created in 1916. It contains 38 acres and within its bounds are an abandoned Indian village, numerous remarkable totem poles, and other objects of interest. It is desirable that this deserted totem pole village should be preserved for there are at least 50 large carved poles before the broken-down huts.



Above—William Shelton's totem pole, which stands in Everett, Washington.

Below — William Shelton, last carver of totem poles.

When the visitor arrives at Old Kasaan he will find not a living thing in sight. Everything is silent, but one does not expect to see people in this ancient village which the Indians deserted long ago. At least 40 of the totem poles stand facing the sea. They are carved from pine, and the figures are continuous from top to bottom. Every totem has its story to tell, and the whole carving forms a sequence understood by the owner and his family. The totem poles are touched in places with dull blue, red and black paint, and they are weird and uncanny. Some of the poles are decayed and broken, yet it is possible to distinguish the animals that surmount the top. You see on some the seal, on others the raven or eagle, on another a bear, and on still another the fabled animal known as the thunder bird.

Totem poles in Old Kasaan.

A plan is being considered for removing the best of the huts and totems to the ground a mile from Sitka National Monument. The Kasaan totems would add greatly to its picturesqueness, and the problem of preserving them would be solved, for there is danger of fire destroying Old Kasaan—one fire has already ravaged it—and the relics have suffered from the elements.

Old Kasaan was built by the Indians of the Haida tribe, and at one time several hundred persons lived there. But it was abandoned shortly after towns and salmon canneries developed. When the Indians migrated from Old Kasaan, they gave little thought to the intrinsic historic or archeological value of the contents, and they trusted the whites to leave their ancestral belongings in their huts. Most of these have been carried away, and carved and decorated articles of wood, bone, shell, used in the Indian feasts and dances, religious rites, marriage and death ceremonies, have been stolen by vandals. The stores of some of the Pacific Coast cities hold some of these, and even some of the totem poles were removed.

It is possible that the Indians will rebel at having their totems removed, but aside from acts of vandalism and destruction by fire, the moisture in this part of Alaska rots the wood, and the various colorings of paint which add to the charm are beginning to disappear, while lichens and mosses have begun to grow on the sides. It will take a large sum to repair these huts and totems and station a caretaker over them, and so the alternative proposal is being considered. This is that the Forest Service, in charge of Old Kasaan, be commissioned to take the huts and poles to Sitka, where E. W. Merrill is in charge of some totems which originally came from Kasaan, and which were exhibited at the Louisiana Purchase Exposition and later returned to Alaska.

It is interesting to notice the way in which the decaying houses are put together at Old Kasaan. They were built before the white man introduced nails, and so the building material was cleverly put together by means of notches and grooves. District Forester Flory, in making his report on the monument, calls attention to this, and suggests that, if it is decided to take the totems to Sitka, the remains of the native structures should also be carried and a small native village reconstructed as nearly as possible like Kasaan. Perhaps half a dozen houses could be rebuilt, and the totems placed before them in their original position. One house could hold as many relics as could be procured, and a replica of the cemetery with its grave totems could adjoin the village.

This may be a good suggestion. Alaskans believe that Alaska is entitled to any Indian or prehistoric relics found in the territory, and that they should not be taken to the United States. As Sitka grows more and more popular as a tourist center in summer, the huts and totems, if removed there, would be seen by hundreds where one person sees them now. A bill has been introduced in Congress to this effect, and Alaskans are eagerly watching to see if it passes.

Any removal of the Old Kasaan village must be done with the consent of the Indians. No one knows whether it will be possible to make them understand that the encroaching forests and weeds may make this deserted village disappear, and that the preservation of their totems, with their caps representing the whale, beaver, eagle, raven, frog and other animals, will be a work of helpfulness on the part of the white man.

The totem meaning and bond is strong with the Indian, but he has been so often cheated that it is difficult to convince him of disinterested kindness. The Bureau of Education may be able to do so, and this is what persons interested in Old Kasaan are hoping for.

Sitka, near which is located the Sitka National Monument and to which it is proposed to remove some of the totem poles from Old Kasaan, was long the capital of Alaska under the Russians, who called it New Archangel. Later it was the capital of Alaska under the United States Government until a few years ago, when Congress selected Juneau as a new capital on account of its more central location. Today Sitka is fast losing its ancient glory and, unless something unforeseen occurs, will probably sink back into the insignificance of a trading station. It was the scene of numerous stirring events and many of the present buildings in the town have a history attached to them that would make interesting reading. It would not be at all surprising if some Jack London should find material there for a new "Call of the Wild."

One of the largest of the existing buildings is the old Russian citadel, where the Russian governors once dwelt, ruling the country in a manner similar to that of the autocrat whom they represented. Among these governors Baranof was probably the most notorious.

It was he who, when traveling from place to place over the vast domain, compelled natives to carry planks upon their shoulders and to bridge, for the protection of his boots, any muddy spot he might have to cross. Baranof was much dissipated, and only a shade less cruel than Solovief who, desiring on one occasion to test the penetrating powers of a new musket, placed 12 natives in a row, breast to back, and fired a shot into the breast of the foremost one. Nine dead natives was the result.

Did Mother Goose Rhymes Come From China?

Children of the Orient, From Farthest Antiquity, Have Known "This Little Pig" and "Pat a Cake" and "Lady Bug" and "E ni me ni mi ni mo"

By MRS. L. M. CRAMER

OUT of the tragic humiliation of an old woman devoted to her little grandson, grew her lasting fame. More than 200 years ago there lived in Boston a delightful old character, Mrs. Mary Goose. Unfortunately, or perhaps after all it was fortunately, she lived with her son-in-law, Thomas Fleet, a publisher, to whom she was a constant source of annoyance because of her habit of making up senseless little rhymes which she told in a singsong chant to his little son. The baby loved those rhymes, but Thomas Fleet despised them, and as his dislike for them grew with every hearing, so also his dislike for his mother-in-law grew, but more than apace.

Thomas Fleet talked to Mary Goose, not too kindly, it is told. First he urged, and then he demanded that she desist from rhyming. But the child cried for the jingles and when the good woman thought she would not be detected, she chanted away both to her own and the child's content.

Suspicious that this might be the case, Thomas Fleet returned to his home unexpectedly one day, arriving just in time to hear the thrilling climax of "Fa fe fi fo fum" and the tragedy of the ground bones of an Englishman which were to be used to make bread, according to the jingle.

Immediately, Mr. Fleet determined upon a course which was so to humiliate Mary Goose that she would never dare to disobey him again.

So he went into Mary Goose's presence and, in a manner most affable, requested her to repeat some of her rhymes for him, and the confiding old lady, believing Mr. Fleet had suffered a change of heart, repeated several which were the favorites of the Fleet child. He wrote them down, and then one day, shortly afterward, there appeared in print these senseless little ditties, signed "Mother Goose."

When Mary Goose Helped Make a Book

IT WAS cruel, and Mary Goose's heart all but broke. She felt she could never again raise her eyes to meet those of her friends, and Thomas Fleet, so the story goes, sort of "rubbed it in"—bore on unmercifully in his recital of anticipated reactions from the publication. She would be—was even then—the laughing stock of all Boston, he declared, and Mary Goose wept and refused to be comforted even by her little grandson, who, in turn, wept lustily for his nightly recital of the jingles, and wept in vain.

But the reaction was not what Mr. Fleet had anticipated. Very shortly after the publication of her ditties Mary Goose found herself to be a person of some importance. Mothers and grandmothers had read these senseless rhymes to fretful and peevish children, and they had been strangely quieted. Other women who had known of her existence only as "Thomas Fleet's peculiar mother-in-law" came to call upon her. The fame of her jingles went far beyond the confines of Boston town and long before she died Mary Goose, poor modest soul, found herself famous. Thomas Fleet made the best of his mistake, published the ditties in a little volume and reaped the financial reward, nor was he ashamed at that time to have his name appear in connection with the book. The first edition bore this title:

"Songs for the Nursery.
Or
Mother Goose Melodies for Children
Printed by Thomas Fleet at his
Printing House
Pudding Lane
1719
Price Two Coppers."

Mary Goose lies buried in the Old Granary Burying Ground, in the heart of Boston, and thousands of persons visit her grave every year.

In his youth Isaac Taylor Headland, an American educator, was one of Mother Goose's most ardent admirers. When he grew up he went to China on an educational mission, and became, after a time, a member of the faculty of Peking University.

When Dr. Headland first went to China, and before he had learned the language, he used to walk at dusk along the streets and watch the old Chinese women with babies on their laps, intent upon the words their grandmothers were repeating to them. There was something about the picture that carried him back to his own childhood, and the dear old grandmother who used to hold him on her lap while she repeated Mother Goose jingles to him, just at the hour in the dusk when the sandman was approaching. Some way it became his homesick time of day, and yet so fascinated was he by the sight of the old women with their grandchildren that he used to walk along those streets where he had learned to know he would see them most frequently. Not understanding a word of the language, there unconsciously crept into his memory, one after another, those Mother Goose jingles he had loved the best. He got so he felt almost sure that certain of the Chinese grandmothers were telling the thrilling story of the cow that jumped over the moon, and that others, as they fondled the little bare feet of babies, were "counting the pigs" in Mother Goose rhyme, translated into Chinese.

And to an extent he was right, for when he got to understand the language he was surprised to find that these Chinese grandmothers were repeating ditties very similar indeed to those to which he had listened in close attention when he was a lad. The strangest part of it all is that these old Chinese women had been repeating these ditties for hundreds of years. They had never been printed, but had been handed down by word of mouth from one generation to another. Nor had Mother Goose ever heard of the Chinese jingles—all she knew about China was that the people there needed to be prayed for, and that missionaries must be sent there to convert them to Christianity. There was no plagiarism on the part of Mary Goose, nor could the Chinese, by any flight of imagination, be thought simply to have translated her jingles, for they had these same jingles hundreds of years before she was born.

Each, perhaps, contributed to the need of the young of their time, as they saw that need.

Dr. Headland made the study of the Chinese Mother Goose rhymes his avocation while in the Orient. He collected more than six hundred of these ditties, and published them both in the Chinese and the English language. For the most part he collected these six hundred rhymes in two of the eighteen provinces. "There are probably more nursery rhymes in China than can be found in England and America," he said. "I have no reason to believe that I succeeded in getting any large proportion of the ditties in these two provinces either."

Incidentally, Dr. Headland published the first book of the rhymes and it was the first time any attempt at publication of any of them had been made.

In most of the rhymes, as can be readily seen, there are features common to our own beloved Mother Goose. There are references to insects, to animals, birds and persons, to children, to food, to different parts of the body, and to action, such as patting, grabbing, tickling, and there are references to trades, to business and to professions.

Said Dr. Headland: "I have tried in my translations to reproduce the meaning of the original as nearly as possible; this has not always been an easy task. The Chinese never made any pretentions to literary merit for these jingles, neither, in fact, did Mother Goose make any such claim for her jingles. In translating them I made no attempt at regularity in the meter, because neither the original nor our own Mother Goose is regular. I simply aimed to make a translation which would be true to the original. The child, not the critic, was always kept in view."

Ancient China Shows the Self-same Spirit

DR. HEADLAND called attention to the tenderness and affection that was everywhere apparent in these Chinese jingles. "There is no language in the world more expressive of keen and tender affection than that used in some of these Chinese Mother Goose melodies," he said. "One reason I decided to translate them into English was with the hope that such translation will present a new phase of Chinese home life, and that it may lead the children of the West to have some measure of sympathy and affection for the children of the East."

Our grandmothers, and our mothers, for two hundred years have held babies on their laps at dusk, and "told their pigs."

"This little pig went to market,
This little pig stayed at home,
This little pig had a piece of roast beef,
This little pig had none,
This little pig cried;
Wee wee, I want some."

And always it was the big toe pig that went to market and the little toe pig that "wanted some."

Over in China the grandmothers tell the toes, also, telling them like this, pinching gently each little toe as they tell them off; but the Chinese grandmothers say:

"This little cow eats grass,
This little cow eats hay,
This little cow drinks water,
This little cow runs away,
This little cow does nothing,
But just lie down all day.
We'll whip her."

And the Chinese grandmother "tells" the baby's fingers as well as his toes. She says:

"This one's old,
This one's young,
This one has no meat.
This one's gone
To buy some hay
And this one's on the street."

And the little finger "on the street" gets smothered in kisses.

The Chinese have a little verse, teaching the senses—four of them—which runs like this:

"Little eyes see pretty things,
Little nose smells what is sweet,
Little ears hear pleasant sounds,
Mouth likes luscious things to eat."

Our American boys and girls "count out" in their games, something like this:

"E ni me ni mi ni mo
Catch a nigger by his toe
If he hollers, let him go,
E ni me ni mi ni mo
Out goes he (or she),

and the last one counted is "it." In China they say:

"E ni me ni mi ni mo
One two three and an old cow's eye
When a cow's blind, she'll surely die;
A piece of skin and a mellon too,
If you have money
I'll sell to you;
But if you are without,
I'll put you out."

And the unfortunate on whom "out" falls is "it" in the games, many of which are similar to our "Tom Tom Pull Away," and "crack the whip" that we played in the good old days in the little red schoolhouse, and which school children still play, if they are fortunate enough to go to the little red schoolhouses of the land.

The American youngster loves his

"Lady bug, lady bug
Fly away home
Your house is on fire
Your children will burn."

and so, also the little Chinese lad or lassie loves his

"Thistle seed, thistle seed,
Fly away, fly,
The hair on your body
Will take you up high;
Let the wind whirl you
Round and round,
You'll not hurt yourself
When you fall to the ground."

And it is, after all, the more pleasant ditty of the two which are so similar, and then the Chinese have another, a "Lady-bug" rhyme, which also ends in a happier manner, for the Chinese deliberately set themselves against saying or doing anything that will cause even a momentary sadness in their little ones. They say:

"Lady-bug, lady-bug,
Fly away, do.
Fly to the mountain,
And feed upon dew.
Feed upon dew,
And sleep on a rug
Like a good little bug."

Our own Mother Goose used to take the hands of the little son of Thomas Fleet, and put them into motion the while she recited:

"Pat a cake, pat a cake,
Baker's man.
So I do master, as fast as I can.
Pat it and prick it
And mark it with a T,
And then it will serve
For Tommy and me."

And the Chinese Mother Goose rhyme that corresponds goes like this:

"Pat a cake, pat a cake,
Little girl fair,
There's a priest in the temple
Without any hair.
You take a tile,
And I'll take a brick
And we'll hit the priest
In the back of the neck."

Is the following jingle a Chinese or an American Mother Goose melody?

"He climbed up a candlestick,
The little mousey brown,
To steal and eat tallow,
And he couldn't get down.
He called for his grandma,
But his grandma was in town,
So he doubled up into a wheel,
And rolled himself down."

Nine times out of ten when questioned on this ditty, an American will pronounce it one of the American Mother Goose rhymes, but nine times out of ten he will be wrong, for it is a Chinese rhyme. I have asked a great many people to place it and almost without exception they call it the work of our own Mother Goose, but it is not.

Here is another rhyme, used for "counting out" in China, to determine who shall be "it" in a game, quite in the same way American children do.

"One grab silver.
Two grabs gold,
Three, don't laugh
And you'll grow old."

Somewhere, I am sure, there is an American counterpart for the following ditty, but I have been unable to

(*Concluded on page 13*)

The Vanishing Dollar of the Daddies

Wherein Is Disclosed a Bit of History Hitherto Kept in the Dark

By H. L. LOUCKS

AS A financial proposition, and from a sane business viewpoint it would seem incredible, that while our government was spending millions of dollars in expensive advertising, to induce and even compel our people to scrimp, save and borrow money or credit to buy government bonds, our "fiscal agents," the Federal Reserve Bank System, should deliberately have planned to destroy, at great loss to our government at first and the whole people of the nation later, $350,000,000 of our lawful money. This was done in Congress April 23, 1918.

There never was another bill enacted into law by our Congress, or any other legislative body, under such a shamefully deceptive title.

The title: "An Act to conserve the gold supply of the United States, to permit the settlement in silver of trade balances adverse to the United States; to provide silver for subsidiary coinage, and for commercial use; to assist foreign governments at war with the enemies of the United States, and for the above purposes to stabilize the price and encourage the production of silver."

It required super-experts to crowd so many misstatements of facts into so few words.

The first section provides: "That the Secretary is hereby authorized from time to time to melt, or break up and to sell as bullion not in excess of three hundred and fifty million standard silver dollars now, or hereafter held in the Treasury of the United States."

It required just 15 minutes to pass the United States Senate.

Thirty years ago it would have caused a political revolution. Five years ago it passed in silence.

The real aim of the Federal Reserve Bank System was to retire, hoard, or decoin all of our lawful money, and substitute therefor the ledger credits of the 12 private corporations, the 12 Federal Reserve banks.

Don't Let the Looks of Figures Scare You

THE silver certificates, not lawful money—just currency—were redeemable in silver dollars, and the silver dollars were in the Treasury to redeem them. This was intended to retire the certificates and decoin and export the bullion, so that it could not again be recoined into lawful money.

The silver dollars had two serious faults as seen by the Federal Reserve System. First, they were lawful money, and in circulation, whether as coin or certificates, they were a menace to plans for a complete monopoly of our financial system.

Second, they were issued into circulation without paying any tax or tribute to anyone, and, of course, that is most unusual.

Did we have a surplus of lawful money to spare at that time, April 23, 1918? The second Liberty loan was issued November 18, 1917, for $3,000,000,000, and the rate of interest advanced to four per cent. A third Liberty loan for $3,000,000,000 was offered April 6, 1919, and the interest rate advanced to four and one-quarter per cent—a very plain hint that money was becoming scarcer. But, on April 23, 1918, without discussion, publicity or debate, a bill for the utter destruction of 350,000,000 standard silver dollars, lawful money, stamped on metal then worth one-third more than the bullion, was authorized, at a loss to the Treasury of $80,000,000.

It would really be unbelievable that when millions of dollars was being spent to impress upon our people the danger of invasion and of our government's need of money, our Congress should unanimously and without discussion enact such a law.

Page 492, Annual Report for 1919—"The melting of the silver dollars for use as bullion was continued through nearly the entire fiscal year, the operation incident to sale of 200,000,000 fine ounces of silver to the government of Great Britain for use by the government of India being completed in May, 1919. More than 191,000,000 dollars were melted during the year, giving total melted under the Act of April 23, 1918, of 260,121,554 silver dollars."

"Silver dollars aggregating 116,538,397 fine ounces, having a face value of $151,569,000, were received from other treasury offices for melting."

You will note that the loss on that amount, in addition to the cost of melting, and so on, was $35,030,603; the loss on the $350,000,000 then would be more than $80,000,000.

That the authors of the bill knew that the government would suffer a great loss is evident from a reading of Section 4—"That the Secretary of the Treasury is authorized, from any monies in the Treasury not otherwise appropriated, to reimburse the Treasurer of the United States for the difference between the nominal or face value of all standard silver dollars so melted or broken up and the value of the silver bullion at $1 a fine ounce of such standard silver dollars."

But, notice how easily that loss of $80,000,000 was paid.

"The Secretary is authorized, from any monies in the Treasury not otherwise appropriated, to reimburse the Treasurer." As the Secretary explained, "just a shifting of the loss on the ledger."

How simple; *but you will find it in your tax bills.*

On page 8 of the annual report of the Director of the Mint, for 1920—"The coining value of silver for United States dollars is $1.29 an ounce; and for United States coin below the dollar, $1.38 an ounce; therefore the price of silver reached the point where our principal metallic circulating medium was menaced by the prospect of going to the melting pot for realization of the holder thereof of the profit incident to greater bullion value, than face value."

That is really amusing, coming from an expert.

There was a danger of our losing the balance of our silver dollars worth a premium of 29 cents over their face value, and that must be prevented! How? Our "fiscal agents," the Federal Reserve banks, rush to the rescue: page nine—"At this time, the Treasury, acting in co-operation with the Federal Reserve Board and banks, arranged to release silver dollars to be employed in regulating our exchanges with countries having a silver monetary standard."

To whom does the Secretary of the Treasury owe allegiance?

As Secretary of the Treasury, he becomes chairman of the Federal Reserve Board. The Secretary of the Treasury becomes embarrassed with silver dollars, having a bullion value of 29 cents more than the face value, and in consequence there is a danger of their being melted by the holder's for private profit, and this must be avoided. But, as chairman of the Federal Reserve Board, he arranges with the Federal Reserve Board to assume the responsibility of handling all of the free silver dollars that come into the Treasury and the Federal Reserve Board arranges with the Federal Reserve Bank of New York, co-operating with the branches of American banks in the Orient to accept of them, and so on. Very simple, indeed.

But who gets the 29 cents on the dollar profit?

And in what way does that prevent the loss of the silver dollars?

The reasons given in the Title of the Bill are not at all complimentary to the intelligence of our American citizenship as measured by the judgment of our lawmakers.

Space will forbid analyzing them as they deserve at this time.

Senator Pittman, the supposed Silver Leader in the Senate, felt called upon to give the history of the enactment of the so-called Pittman Act, which explanation appeared in the *Congressional Record* of date August 26, 1922, and from which we will quote briefly.

It is a well-known fact, that for several years the trade balances had been very large in our favor. For instance, for 1917 the trade balance in our favor was $3,634,450,905, and for 1918, $2,982,226,238. But, even if the trade balance had been against us, there was not one foreign country that would not have been glad to accept our coined standard silver dollars, at their face value.

A Bit of Inside War and Finance News

SENATOR PITTMAN says:

"I was sitting in my office one day in the early part of 1918 when I received a telephone message from Mr. Raymond T. Baker, the Director of the Mint. He urged me to come down to the Treasury Department immediately to confer with regard to some very important matters . . . . I, of course, went immediately to the Treasury Department. There I found Mr. Leffingwell, Mr. Straus, Mr. Baker, and other representatives of the government, the British ambassador and other representatives of foreign countries, giving instant evidence by their demeanor of the grave crisis that occupied their thoughts.

"The British ambassador at once frankly stated the case. He informed us that the Indian Government, under British supervision, had spent years and years teaching the Indians to accept paper certificates in lieu of silver rupees, which certificates were payable in silver on demand; that to facilitate this development the Indian Government had established many agencies of redemption throughout India.

"The Indians had finally become confident of the power and willingness of the Indian Government to redeem these certificates and a large surplus of silver for redemption purposes was not required. Therefore this surplus had been allowed to decrease, and there was not nearly enough silver in India to redeem the certificates if presented. The Germans, so he told us, had started a propaganda in India to the effect that the British Government could not redeem its silver certificates, and this had started a run on the Indian redemption agencies. He frankly confessed to us that in a very few days the Indian Government would be compelled to admit that it could not redeem these certificates unless a supply of silver could be obtained, with the result that there would be great disturbances in India.

"Astounding as is the fact, it was discovered that there was no surplus supply of silver in the world except the four hundred and odd millions of silver dollars lying in the Treasury of the United States to secure the redemption of the silver certificates issued against them."

Not only does this show that regardless of what the "base" is, the nations are always on "paper," but it also prompts the question: Can any one doubt but that under those circumstances Great Britain would gladly have paid a premium for the coined silver dollars?

It is very strange indeed that a government so greatly in need of money, and borrowing at four and a half and five per cent, had not pressed our mints into three-shifts-a-day service, coining subsidiary coin, that would have gone into the public service, free of tax or interest, and at a handsome profit.

"To assist foreign governments at war with the enemies of the United States." We were loaning foreign governments by the billions of dollars, and they were willing to accept of our credit at par. Why then when it came to the actual money should they demand a discount of 29 cents on the dollar?

How the Thing Was Done—Quietly

"TO ENCOURAGE the production of silver." Encourage production, by demonetizing it! By melting and exporting the silver dollars in the vaults of the Treasury, for an even dollar, when the bullion value was $1.29 instead of buying in the open market. During 1917 silver bullion sold at $1.15, and soon after the enactment of this "encouragement" the price fell to the market level of 82 cents.

When in December, 1919, additional silver was wanted for coinage of minor coins, instead of encouraging silver production by buying the bullion in the open market, they took an additional 10,000,000 standard silver dollars, then in the Treasury, and melted and used them, and the director of the mint takes credit for making a net profit of $692,068.

According to the February report, there is only 38,348,000 silver dollars to be coined, and that will be the end of dollar silver coinage, arrangements being perfected to ship them to the Orient. Then goodby for all time to the "Dollar of the Daddies."

Our whole financial system was to be changed from one of money to one of bank ledger credits for private profit. In this case the real reason was twofold. First, to get rid of the possibility of hoarding lawful money against THE DAY when Shylock will spring his trap. Second, to get rid of that menace to their whole financial program, namely, a dollar that can go into circulation without first having to pay a tribute to banks and a perpetual annual tax.

Senator Pittman said of the passage of the bill in the Senate: "There were few speeches made on the subject in the Senate, and those speeches carefully guarded the prime purposes of the bill, as publicity would have but increased the danger. Each Senator, however, was personally informed with regard to all the facts. Every now and then some Senator would enter the Chamber who by some chance had not received information with regard to the bill. He would rise to his feet for the purpose of asking questions, but his coat tail would be tugged by some other Senator and he would silently and in amazement collapse in his seat.

"The bill passed the Senate with only two dissenting votes. It went to the House of Representatives. It was referred to the Committee on Banking and Currency of that body. . . . No bill of such far-reaching importance was ever so peculiarly passed or so rapidly acted upon."

Did Mother Goose Rhymes Come From China?

Concluded from page 12

find it though I am positive I remember hearing it as a child:

"There's a cow on the mountain,
The old saying goes,
On her legs are four feet;
On her feet are eight toes;
Her tail is behind
On the end of her back
And her head is in front
On the end of her neck."

The Chinese Mother Goose gave the following to the children of China:

"Knock at the door,
See a face,
Smell an odor,
Hear a voice,
Pull your chin.
Kechih, kechih."

While the Mother Goose who was Thomas Fleet's mother-in-law gave the following to the little children of America:

"Knock at the door,
Peek in,
Lift the latch
Open the door,
Walk in.
Hoochie, hoochie."

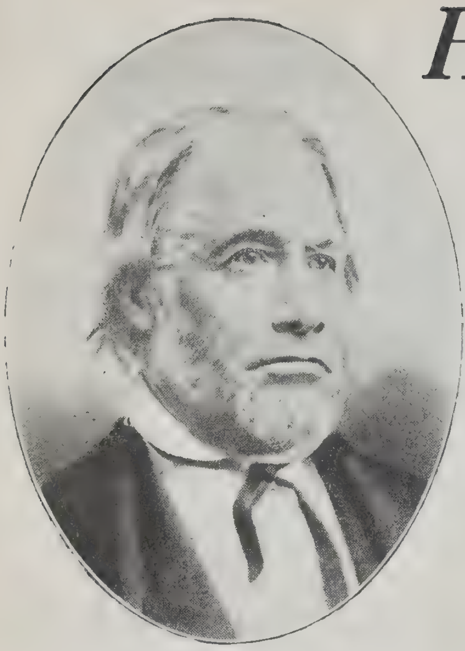
In either rhyme the one repeating it "knocks" on the forehead in the first line, lifts the eyelids in the second, gently up-tilts the nose at the end of the third line, at which the little one gets the cue to open its mouth, and the narrator's finger is poked into it. In both China and America the baby's chin is tickled on the last two words, provided the game is carried out to its intended completion.

No one knows who the Mother Goose of China was, but she has been followed by many generations of happy grandmothers who do her honor and occasionally, perhaps, add a bit of doggerel of their own. All track of the originator of such ditties in China was lost centuries ago, according to all that Dr. Headland could learn. A bronze tablet on a house in Boston, not so very far from Copp's Hill Burying Ground, carries an inscription to the effect that that is the house in which Mother Goose lived.

He Found Gold in '48: It Pauperized Him

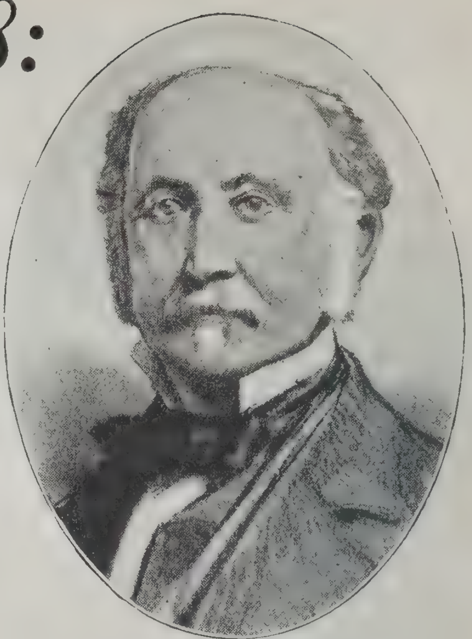
How the Two Men Who Made the Greatest Discovery of the Precious Metal Ever Made in the World Were Reduced to Poverty and Paupers' Deaths by It

By HARRY H. DUNN



JAMES W. MARSHALL,

Who discovered the first nugget of gold in California, and who was destroyed by the results of that discovery.



GENERAL JOHN A. SUTTER,

Builder and owner of an empire in California during the days of '49, and who was reduced to a pauper by the discovery of gold on his land.

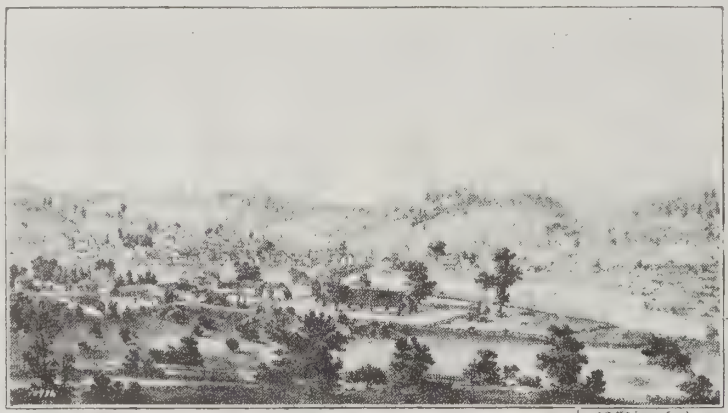
THERE is a saying among Spanish miners in the New World that "He Who Finds Gold Dies in the Almshouse."

The yellow metal has built empires for those who possessed it; it has destroyed empires for those who found it.

More than this, and worse than this, it has destroyed the men themselves, not necessarily nor always through avarice, or through excesses which gold can buy, but through some turn of the economic balance-wheel which seems always to hurl those who have made the great "gold strikes" of the world away from the rewards those discoveries would seem to entail.

What has become of the men who found the Welcome nugget, the Comstock lode, the Homestake mine, or the vast alluvial deposits of the Urals and further into Siberia? Certainly, none of them hold these possessions now; and most of them went on, and on, and on again, seeking new fields, fresh placers, always hunting the mysterious "Mother Lode" that no man yet has found.

In California, where was made, in 1848, the greatest discovery of gold known to the world either before or since, the finding of the precious metal not only ruined the men who found it, but destroyed an agricultural and industrial empire one of them had erected, an empire which was not again made productive for nearly half a century. When California was ceded by Mexico to the United States, she was not considered a great asset. The settlement of the Mississippi Valley, especially its western half, had been slow and sparse, and the main question that permeated the acquisition of any new territory was whether its people were for or against slavery. But this problem, along with all others, was forgotten when James W. Marshall, building a small lumber mill for John A. Sutter, on a tiny creek near Colma, picked up a rough, red lump on the afternoon of January 24, 1848. The lump was pure gold, but the finding of that little nugget spelled ultimate poverty for Marshall, destruction of all the cattle and the grain on the thousands of acres belonging to General Sutter, and eventually the latter's death at the verge of pauperism. The whole story is economic, one of those disasters gold brings sometimes suddenly to men and to nations.



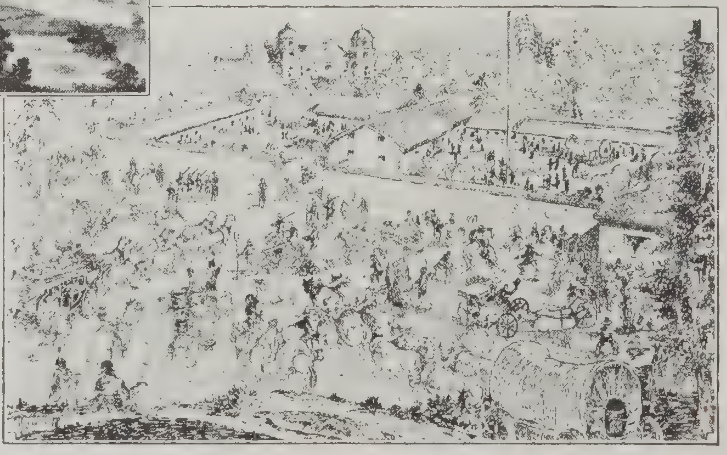
Colma, where gold was discovered by James W. Marshall, in 1848, as the village appeared at the time of the discovery, from an old drawing now in California State Museum.

The discovery was kept a secret until March 15, 1848, when it was published in a weekly newspaper in San Francisco, then a town of 700 inhabitants, clinging precariously to the hills rising on the southern side of the Golden Gate. Even then there was not much interest until Sam Brannan a man of importance in the town, and afterward a leader of its famous Vigilantes, returned from Colma with a bottle filled with gold dust. Immediately the rush was on; overnight San Francisco was almost depopulated, ships in the harbor were deserted, and, as the news of the "strike" spread eastward, a stream of immigrants started across the plains, around the Horn and across the Isthmus of Panama, headed for the setting sun. From 10,000 in 1847, the population of what is now the state of California leaped to more than 100,000 in three years, and Sutter's Fort, where Sacramento now stands, became the goal of myriad Jasons seeking anew the Golden Fleece.

Among the men who had arrived in California some time before Marshall made his epoch-marking discovery, Captain John A. Sutter, by birth a Swiss, educated at Berne Military College, whence he graduated in 1823, and afterward an officer in the French Army, was probably the most prominent, the best educated, and the most capable. He reached Monterey, then the capital of the state, in 1839 or 1840—authorities differ on this—with eight Kanakas, given him by the king of the Hawaiian Islands. Being an adventurer of parts, with a trail around the world, Sutter was given warm welcome by Juan Alvarado, governor of California, who promoted the Swiss captain to be a general, issued to him a passport giving him the freedom of all districts of the state, and gave him full title to 11 square leagues of land, wherever he should select it, provided the selection was made within 18 months.

After a few weeks at Monterey, and a few days in San Francisco, Sutter sold the sloop in which he had girdled the globe, and, taking his faithful Kanakas and three or four white men, among whom was one named Marshall, set out in three small boats to explore San Francisco Bay. Passing through San Pablo and Suisun bays, they entered the wide, flat-walled mouth of the Sacramento and San Joaquin rivers, not hitherto explored by white men, owing to the savage opposition given by the Indian tribes in the delta of these rivers. With his entry into this marsh-bordered stream begins the greatest romance of the Pacific Coast—a romance without a woman in it—a romance with Gold as the villain, and men merely mimes running hither and yon at the whim of their yellow master.

The party proceeded up the San Joaquin to the mouth of the real Sacramento, and there, turning northward, followed it to a point near the site of the present city of Sacramento. There they were met by an armed force of "more than 500 Indians, painted with red and blue and green, apparently to terrify us," says Sutter's diary, now in the historical department of the California State Library. They parleyed with this Indian band, and won their way past, due largely to the fact that the chief spoke Spanish, with which Sutter was familiar. They proceeded on up the Feather River until increasing numbers of hostile Indians, all armed, compelled them to turn back, when they returned to a point on the Sacramento where Sutter's fort now stands, within the city limits of Sacramento.



Sutter's Fort, one of the most celebrated landmarks in California, and once the seat of the empire of land and cattle which John A. Sutter established in the Sacramento Valley. All was wiped out by the discovery of gold on Sutter's acres. From a drawing made in 1849.

There, General Sutter decided to accept the grant of land from Governor Alvarado, and when he came to measure his 11 square leagues, found himself possessed of approximately 83 000 acres of land. Methods of measurement being crude, it is quite probable that he took good measure, and men, who were in the great gold rush which was to follow less than a decade later, have stated that Sutter's original "ranch" covered more than 100,000 acres. On this land, at an elevation slightly above the level of the river and its valley, Sutter began the erection in 1841 of one of the most historic structures in California—Sutter's house, later to be re-christened "Sutter's Fort," a name it retains to this day. In the same year he was made a Mexican citizen, confirmed in his possession of the lands he had measured, and given the title of "Governor of the Northern Frontier." The adventurous army officer was now a man of substance, well on his way to fame and wealth in the Mexican territory of Alta California.

He fought off the Indians, inflicting severe losses on them, with a force of only 18 men, and eventually forced a peace treaty from the leader of the Indians, whom he named "Chief Abraham, because of his long white beard and his general appearance of patriarchal dignity," according to the old diary. So time passed, with fields of barley and wheat springing up on the once bare brown hills and valleys, and with thousands of cattle spreading their animated blanket over them. The year 1845 came, and Fortune again smiled on the man who had dared to invade the delta of the San Joaquin and the Sacramento. Governor Micheltorena, successor to Alvarado, presented General Sutter with 22 square leagues of land, in addition to the 11 square leagues he already possessed. This gave him at least 166,000 acres more and increased his total holdings to something like 250,000 acres, even though he adhered rigidly to the measurements given him, which it is not likely that he did.

Not in modern times in the New World has such an empire lain under the hand of one man. Overnight, Sutter became the most influential man, American, Mexican, Chinese or Indian, in California. His trading embassies reached to the Canadian line, on the north, and deep into Mexico on the south; he opened the largest merchandising post in the United States—at any rate the largest west of St. Louis—and the Indians from the Tehachapi Mountains on the south to the volcanic Lassen and the Cascades on the north flocked to his fort to trade their furs and their beadwork, their basketry and their deerskin garments for the white man's food supplies and for powder and ball.

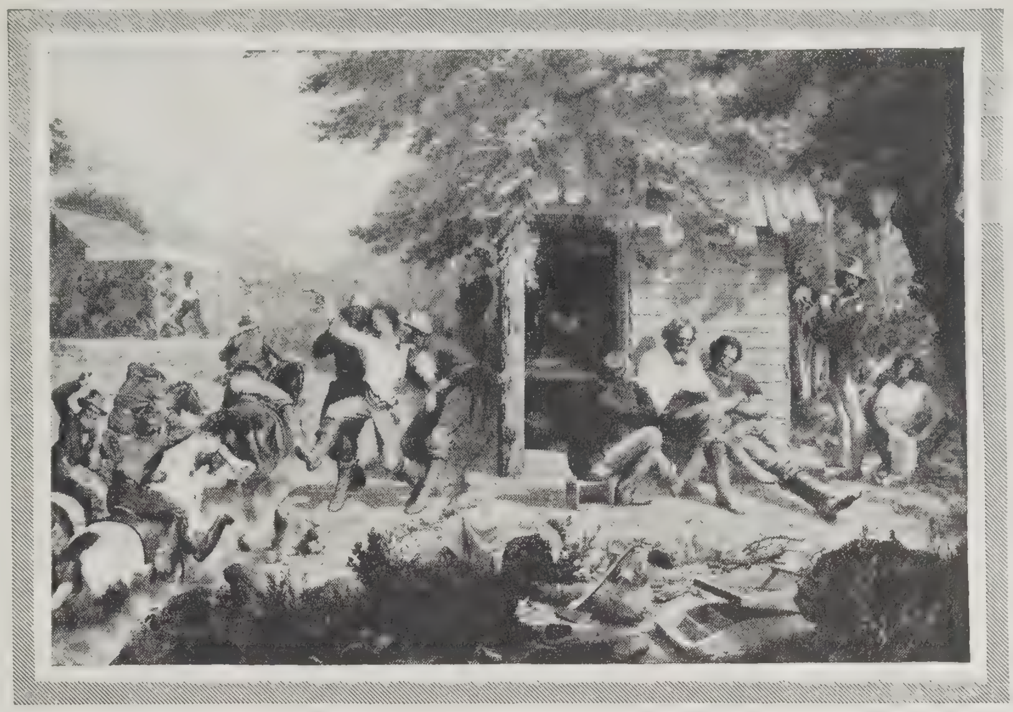
Then—out of such simple beginnings do great disasters grow—in the spring of 1848, Sutter needed lumber for more cabins for additional white men who had come to work for him. He sent James W. Marshall, a staid, sober, reliable carpenter, to select a grove to be cut and a place beside a stream, back in the mountains, to erect a small water-driven sawmill. Alone with a dozen Indians on the bank of a branch of the American River, which he named Sutter's Creek, Marshall longed for white companionship, and, to rid himself of this longing, was accustomed to take long walks, up and down the canyon of the stream, every Sunday. One can see him now, a middle-aged man, far from his home and friends on the Atlantic seaboard, walking, head bowed in thought, memory his only companion, along the graveled margin of Sutter's Creek.

He has told the story that, seeing a cub bear in the brush, he idly stooped for a stone to throw at the little brown animal, but checked his arm in mid-swing when he felt the weight of the pebble he had picked up. At first, he thought it lead, and, knowing the need for lead for rifle balls, dismissed the bear with a shout, and turned to look for more. Scraping of the pebble showed not the gray-blue of lead but the red of gold, and the California gold strike had been made.

In after years, Marshall was wont to say that, had he known the events that were to follow the finding of that pebble, he would have hurled it into the forest, and moved the sawmill, so that other men would have no occasion to wander that way. Like the honest worker that he was, however, Marshall informed Sutter of his discovery, and the two men tried to keep it a secret, and failed, as two people usually have failed when they were intrusted with a secret. The wave of the gold rush of 1849 arrived, coming on foot, on horseback, in wagons, in boats, even by dog-trains—and camped, one and all at Sutter's Fort. At first, these prospectors were miners, who knew gold deposits; then came the clerks, the workmen, the teachers, all those who hoped by a single stroke of fortune to make themselves independent of hard labor for the rest of their lives.

At the beginning, these people had money; they bought from Sutter's store; business was good. Then two factors intervened: The seekers for gold "lived up" all their small hoards of money; and, fast on the trail of these came the riffraff of the cities, Australian convicts from San Francisco; Mexican cutthroats from below the border; bad men from the frontier of the Middle West, gamblers from the centers of population in the East. These were men who proposed to eat, drink and be merry, whether they had the money to pay for it or not. More than 20,000 persons were gathered at one time at Sutter's Fort and along the trails between that place and the mill, half-erected, on Sutter's Creek.

Then, one night, when the money in the pokes of many of these wanderers was running low, some one called their attention to the vast herds of cattle feeding over Sutter's broad acres; some one else suggested that there were millions of loaves of bread in the ripening wheat fields; then a third, more bold than the rest, spread the plan of taking what they needed. At first, they took with the proviso that they would pay when they "filled their pokes"; and Sutter had to take their "chits," their "I. O. U's" for what they ate. Later, they merely took what they wanted, without the formality of giving the general more than their word of mouth for it. Sutter called on his Kanakas, but the whisky brought in by the gold rush had rendered them worthless; he called for his original white companions, and they responded, but they were half a dozen against thousands; he called for his Indians, but they, like the Kanakas, were either drunk, or up on Sutter's Creek, hunting for the gold they could trade for more whisky.



"A Holiday in the Mines," probably the best known painting of the days of '49 which has come down to us. It was painted in 1849 by C. Nahl, a contemporary artist.

After the men in the gold rush had stolen his cattle, eaten his wheat, and destroyed his crops, squatters came in and took his lands. California was in the transition stage; titles granted by the Spanish governors had to be confirmed by the new American courts. What had been a Mexican province became an American state, without the formality of passing through the territorial stage, and she had had no opportunity to collect money for her treasury. When Sutter presented his claims for his losses, he was called on to produce confirmed titles to his land, which he could not do. Meanwhile, the squatters, through various means, some of them questionable, obtained titles to their farms from the American courts, and, gradually, this one-man empire of more than 250,000 acres of the finest land in California, melted away.

Sutter expended more than $200 000 in the California courts, and paid more than $30,000 in taxes to the treasury of the new state, but all in vain. His titles were thrown out of court whenever they came in conflict with the "squatters' rights," and, finally, the one-time multimillionaire was reduced to poverty, all because one of his workmen had chanced to pick up a golden pebble to throw at a cub bear. Friends at length interceded with the state government, and California magnanimously gave to the man, who had made settlement of the Sacramento Valley possible, a pension of $250 a month, which was continued for 14 years.

Discouraged and broken in health and heart, General Sutter left the state and retired to Littitz, a little Moravian colony, in Pennsylvania. He died in Washington, in 1880, while attempting to obtain recognition of his claims by the Federal Government, and was buried in Littitz a few days later. Through the efforts of the Sacramento organization of the Native Sons of the Golden West, Sutter's Fort has been preserved to the state forever. This organization, in 1890, paid $20,000 for the fort, which has been converted into a museum. The property today, considered as Sacramento city real estate alone, is worth rather more than $100,000—less than one-hundredth part of the fortune of General John A. Sutter at the height of his career in California under Mexican rule. The fort has been restored from the same materials—adobe bricks—of which it was originally constructed, and contains an extensive collection of relics of Sutter and of early days in Northern California. Locally considered, it is probably one of the most valuable historical museums and collections in the world.

In the historical department of the California State Library is preserved Sutter's diary, which he kept throughout his life in California, from the time he landed at Monterey in 1839 or 1840, until he left the Pacific Coast forever. An extract from this diary, with the spelling and punctuation unchanged, tells the following interesting story of one of his battles with the Indians:

"In the spring, 1840, the Indians began to be troublesome all around me, Killing and Wounding Cattle, stealing horses, and threatening to attack us en Mass, I was obliged to make Campaigns against them and punish them severely, a little later about 2 a 300 was appoching and got United on Cosumne River, but I was not waiting for them. Left a small garrison at home, Canons & other Arms loaded, and left with 6 brave men & 2 Baqueros in the night and took them by surprise at Day light. the fighting was a little hard, but after having lost about 30 men, they was willing to make a treaty with me, and after this lecon they behalved very well, and becam my best friends and Soldiers with which I has been assisted to conquer the whole Sacramento and a part of the San Joaquin Valley."

Some idea of the manner in which this man whom gold destroyed lived and conducted his business may be gained from the following, written by General John C. Fremont, when he visited Sutter's Fort in 1844 on an exploring expedition sent out by the United States Government:

"The fort is a quadrangular adobe structure, mounting 12 pieces of artillery and capable of admitting a garrison of 1,000 men; the present garrison consists of 40 Indians in uniform—one of whom is always found on duty at the gate. The whites in the employ of Captain Sutter, Americans, French and Germans, amount, perhaps, to 30 men. The inner wall is formed into buildings, comprising the common quarters, with blacksmith and other workshops; the dwelling house with other dwellings, occupying the center of the area. It is built upon a pond-like stream, at times a running creek, communicating with the Rio de los Americanos, which enters the Sacramento about two miles below. The latter is here a noble river, about 300 yards broad, deep and tranquil, with several fathoms in the channel, and its banks continuously timbered. There were two vessels belonging to Captain Sutter near the landing—one, a large, two-masted lighter, and the other, a schooner, which was shortly to proceed to Fort Vancouver for a cargo of goods."

Why Poverty in a Land of Plenty?

By LEVI STEVENS LEWIS

FROM early in the sixteenth century to the middle of the nineteenth century, a period of about 250 years, the people who settled in the territory embraced within the limits of the 13 original states enjoyed more material prosperity perhaps than was anywhere else enjoyed on earth during the same period.

Without mints for the coinage of gold or silver, with only printing presses for the manufacture of money, by virtue of manual energy, activity plus contentment, they "replenished and subdued the earth" and made what was formerly a wilderness to blossom as the rose.

In less than half a century, exactly 47 years, from the date of the first session of the first Congress early in 1789, the surplus accumulation of money in the National Treasury, over and above all necessary government expenditures, was $37,468,859, which sum Congress voted to distribute among the several states according to population as a sort of dividend of national prosperity. Meantime the cost of two wars with Great Britain had been liquidated.

Five years later (1842) Charles Dickens, the English novelist, then visiting in Boston, in a private letter to friends in London, wrote that every family in New England was blessed with a comfortable blazing hearthfire and meat dinners 365 days in the year and that "a beggar on the streets anywhere in New England would occasion as much surprise as a flaming sword suspended in the heavens."

But it's different now. It has been different ever since the war between the States, which was begun with the approval and doubtless by instigation of the money lenders of Europe, in April, 1861.

In 1862 "the capitalists of Europe" dictated the future financial policy of the United States of America. They forcefully informed the influential bankers of America that their interests, as bankers, and lenders, required a change of American industrial conditions.

Chattel slavery was declared to be wrong—not wrong morally, but wrong industrially. Chattel slavery necessitated the trouble and expense of clothing, feeding, sheltering and otherwise caring for the slaves. So chattel slavery should be abolished and all workers, both black and white, made slaves. And then let the slaves shift for themselves.

"Let capital control labor by controlling wages." "This can be done by controlling the money." And "the great debt that capitalists will see to it is made out of the war, must be used as a means TO CONTROL THE VOLUME OF MONEY." "To accomplish this, bonds (debt) must be used AS A BANKING BASIS."

And so the national banking law of 1863 was passed and it is said that when President Lincoln, compelled as he was to do so by stress of civil war, signed the act, with an angry frown on his face, he flung the pen across the room, this signifying his intense disgust with the circumstances.

Accordingly the American monetary system is founded not on gold as we have been informed but on public debts, and these debts "must be made permanent and rightly managed." In other words, the debts must never be paid but serve as a perpetual agency to keep the people of the United States in Bondage and Ignorance.

And so the government of the United States, and the people of the United States, and the several state governments, and nearly every one (at least the great majority) of American municipalities are bankrupt like the nations of Europe.

But "the bankers and lenders" have thousands of millions, literally hundreds of billions of money to loan to carry on wars without end, and the bankers and lenders do not produce the value of a pound of cotton or a peck of corn from one year's end to another.

And then they inform us that "credit can be manufactured overnight" and in war times they tell us that "money can be manufactured with printing presses."

Yes, it's true, money can be and has been manufactured with printing presses, *as have also interest bearing bonds.*

And as the natural sequence to all this, we see poverty and its attendant evils increasing frightfully.

But what about the present and the future?

For what has recently become known as "The Community Chest Plan" different cities raised last November different sums for charity thus:

Cleveland, Ohio	$4,500,000
Saint Louis, Missouri	800,000
Denver, Colorado	620,000
Dayton, Ohio	298,000
Boulder, Colorado	30,000
Total	$6,248,000

Doubtless many other municipalities did likewise for it seems to have been carefully planned as a permanent institution of "Charity."

Applied in like ratio to the entire population of the United States, it will amount to an additional tax in excess of Three Hundred Million Dollars every year. Those who know more about the matter than I pretend to tell me that the "paupers" will do well to get 25 per cent of the amount collected while the balance will be used variously.

The whole scheme is un-American and extremely obnoxious. It further commercializes and perpetuates poverty. Professional beggary is made respectable by patronage of so-called polite society. It is an unholy plan to assist the profiteers to escape taxation by wholesale beggary from the already overtaxed "common people."

If these Community funds represented what is claimed by the sponsors, namely, love or sympathy for the poor and oppressed, the system would be different: in one western city there are at least 150 wealthy individuals any one of whom could draw a check for the entire amount collected in that city without missing the amount contributed.

Is it WISE for the well-to-do people of any community to raise $600,000 to feed, clothe and shelter the paupers of any community?

If so, is it UNWISE to raise $60,000 or $6 000 or $5,000 or any other sum to expose the frightful profiteering, "the wickedness in high places," that make the paupers?

If it is UNWISE or un-Christian, or impracticable, or indiscreet to expose the profiteering, then perforce it must be WISE to prepare to feed, clothe and shelter more paupers the coming November at a cost of $700,000 and still more paupers the following November at a cost of $800,000.

BRIEFLY TOLD

The supposed skull of the Tertiary Period found in Patagonia some time ago is merely a curiously shaped stone and of no scientific value, according to a committee of eminent scientists of the Buenos Aires and Laplata museums of natural history which has carefully examined it. At the time of its discovery great excitement prevailed throughout the scientific world as it was supposed to be the oldest trace of mankind in existence.

Prince Gelasio Caetani, Italian ambassador to the United States, was an Idaho miner 20 years ago.

A Los Angeles man has announced that he is going to erect and manage a hostelry exclusively for canine guests. The dog hotel will cost approximately $50,000 and will have all the modern conveniences, each dog having a bed and a sun porch, with uniformed attendants in charge of each section.

A new material, "Bravolette," is used by a German inventor in the manufacture of safety razors. It looks like ivory, tortoise shell or marble, depending on the manner in which it is manufactured. The advantage of this material lies in the fact that the apparatus cannot rust. There is no need to dry the razor after use, it is sufficient to rinse it. Another advantage is that it is cheaper than razors made of metal.

Secretary of Labor Davis was at one time an iron puddler employed in the rolling mills of Birmingham, Alabama.

The famous Hippodrome has given its last show. This giant New York playhouse has been purchased by a realty corporation with the definite purpose of erecting a commercial structure. Land values are too great in that vicinity for a business that runs only eight months in the year to be profitable. More than 40,000 000 people have passed through its doors and it was considered the national playhouse. It had the largest auditorium, the highest, widest and deepest stage of any theater in the world.

Among the famous inventions of the Chinese are the following: The compass, printing, lithography, suspension bridges and gunpowder.

A whistling buoy lost from the St. Lawrence River a year ago has been washed ashore on one of the Scilly Islands, just off the southwest coast of England, 3,000 miles from its starting point. The only injury was found to be confined to the gaslight case which had been wrenched from the top of the buoy.

The public domain amounts to 182,000,000 acres, the great bulk of which, not yet allocated, lies in the states of California, Utah and Nevada. Some of it has so little value it has not been surveyed.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Under present conditions the timber supply of this country will be exhausted in between 40 and 50 years, according to the chief forester of the Department of Agriculture. Pine timber is being cut eight and one-half times as fast as it is being replaced while hardwood is being cut three and one-half times as fast.

Alaska has produced nearly half a billion dollars' worth of minerals, and 97 per cent of this has come from her deposits of gold, copper and silver.

An Antwerp carpenter bought, for the price of a few francs, from a second-hand dealer, an old picture of which the subject was: "Jesus baptized in the River Jordan." An Antwerp art expert discovered on the painting the date 1640 and the signature of Rembrandt. The painting is said to be worth 2,000,000 francs.

The Prince of Wales is an adept trap drummer.

Christmas trees drawn up from the depths of Lake Michigan off Two Rivers, Wisconsin, in fishermen's nets gave the first evidence of the fate of the schooner *Rouse Simmons,* laden with Christmas trees for the Chicago trade, which disappeared from the face of the water in December, 1912. The bodies of the crew were never recovered.

Wild song birds are caught in England by means of bird-lime and nets and sold in the mean streets in the large cities. The casualties among these caged birds are enormous.

The Cohens are ahead of the Smiths in the New York directory just issued. The book contains 1,981 pages and weighs 11 pounds, four ounces. There are nearly 6,500 Cohens and Cohns and approximately 5,800 Smiths and Smyths. There are 223 Abraham Cohens.

A system of adapting criminal fines to the income of the offender, as well as to the seriousness of the crime, is a unique provision in the proposed revision of Sweden's criminal statutes which has been recommended by the Criminal Law Commission. Under the present system the fines are fixed within narrow limits which in no way serves as a deterrent to the wealthy man, while to the poor man it often becomes a punishment out of all proportion to the seriousness of the crime.

Boy Scouts of Colorado Springs, Colorado, recently planted 4,000 Douglas fir seedlings and 2 000 pine seedlings in the Pike National Forest under the supervision of forest officers. In June the Scouts plan to plant an area containing several hundred acres which were burned over several years ago.

If troubled with rats about chicken house, garage, barn or garden, fasten a length of hose on the end of the exhaust from your gasoline engine—whether automobile or tractor—back the car up within reach of the rat burrow and adjust the carburetor for a rich mixture. Pack damp earth about the hose at the entrance to the hole to seal it and run the engine at a moderate speed for 10 minutes or more and the rats will be destroyed. It might be tried successfully in destroying rats beneath floors where a concentration of gas can be obtained.

In British New Guinea has been discovered a new metal, "Osmiridum," which is said to have eight times the worth of gold.

Swindlers, reputed to have reaped millions through fake charity schemes during and after the war, are preparing to stage a comeback, according to the New York district attorney. These fakers are soliciting alms for the stricken folk of Europe, ostensibly to buy food and clothing for relatives of donors, but actually pocketing the gifts.

"I picked up a country paper in Greeley, Colorado, and discovered 14 pages given over to the announcements of tax sales," writes Charles W. Wood in the New York *World*. "There were about 450 of these announcements on every page —6,300 dramas of blasted hopes in one of the richest agricultural counties in America."

What Electoral College Means

When the Bison Were Plentiful

MINIMUM WAGE DECISION

CHRONICLER OF THE NEGLECTED TRUTH

The Electoral College—and What It Means

Machinery Set Up by Constitution Actually Ignored in Practice

By AARON HARDY ULM

WITHIN a little more than a year's time, political orators throughout the country will be exclaiming something like the following:

"On Tuesday, November 4, next, you will go to the polls and there elect the next President and Vice-President of the United States . . . ."

You will do no such thing. No President and Vice-President will be elected on the Tuesday following the first Monday in November, 1924, as generally is believed. The next executives of the Federal Government will be elected very probably on the second Monday in January, 1925; that is to say, if any candidates therefor receive a majority of votes in the Electoral College.

For no one in these United States really will vote for any candidates for President and Vice-President at the national election of next year. Instead, in all but one state, they will choose electors who will do the actual voting two months later. The voting of the electors will be final in case some "ticket" receives a majority of the votes cast in the Electoral College; otherwise the next President and Vice-President will be chosen by the House of Representatives of Congress.

The foregoing no doubt reads like grammar school civics, for it tells what everybody knows about the curious machinery, still used technically but so far as possible actually ignored, set up by the Constitution for selecting a President of the United States.

There is a good deal about it, however, which many don't know, and there are some things about it which nobody knows—for instance, relative to what would happen under certain contingencies which at any time might arise.

Though the method decreed by the Constitution for choosing a President has been all but set aside in actual practice, the legal necessity of following its forms brings about several singular conditions having to do with Presidential campaigns as well as the possibility of there arising several complications that might be of tremendous national import. The probably most important of the conditions lies in the fact that, by reason of the Electoral College and what has resulted more or less therefrom, it is almost if not entirely impossible for any person to be chosen President unless that person has the approval of large numbers of organized politicians. The most serious possible complications have to do with passing on contested returns from the Electoral College or parts thereof.

Thus, the Electoral College is by no means a mere curious and impotent appendage of the machinery of our National Government. It truly is of great actual importance, and in changing Presidents, via election, at any time the Electoral College might become vitally significant.

Practice and Theory Different

IT IS one of several features of the Federal Constitution that have worked out in practice quite differently from what in the beginning was expected of them in theory. It is virtually the only mechanism in the Federal Constitution that was not based on some long applied principle of Anglo-Saxon government. It was adopted by the makers of the Constitution after much discussion and many changes of opinion as to how the chief executive of the country should be elected.

Only a few members of the Constitutional Convention favored the "popular" election of President.

Not fewer than 10 different plans of election were considered and nearly all of them at various times were acted on more or less favorably.

On several occasions the convention voted to leave the election of President to Congress. The action always was revoked on account of the earnest desire to keep the executive branch of the government absolutely independent of the legislative.

Gerry, of Massachusetts, and others, wanted to leave the selection to the governors of the states. Governor Morris alone seems to have favored a "popular" vote.

Alexander Hamilton appears to have been the leading advocate of an Electoral College method, patterned somewhat after the one then used for choosing the Doge of the Republic of Venice and also after the one used in electing the emperor of the vaporous Holy Roman Empire. Hamilton's plan was more complicated than the one finally adopted. It provided for two electoral bodies. Under it the state legislatures or voters would have chosen the first which would have selected the second, which in turn would have elected the President.

What the convention most desired was to protect the Presidency from the "heats and ferments" of popular political contests. This the convention believed it did in the plan finally adopted. It left the choice of electors to be made "in such manner as the legislatures of the states might direct." It was believed that in each state a group of thoughtful and patriotic men would thus be chosen for electors without any thought on the part of the voters as to whom those electors would favor when the time came to select a President and Vice-President.

The public of that time seems to have been highly pleased with the plan adopted; no one appears to have anticipated that in practice it would not work.

"The mode of appointment of the chief magistrate of the United States," wrote someone in the *Federalist*, in discussing the proposed Constitution, "is almost the only part of the system which has escaped without censure, or which has received the slightest mark of approbation from its opponents."

Of course in the first election of a President the plan worked out in the way that was expected; for, everybody being for George Washington, there was no contest. But upon Washington's retirement, the Electoral College became a virtual formality. Its members voted only as they were instructed or expected to do when elected. The provision which specified that the Presidential candidate receiving the second highest vote should be chosen as Vice-President broke down entirely on the occasion of the tie between Thomas Jefferson and Aaron Burr. This was corrected by the Twelfth Amendment, which provides for specific selection of the Vice-President.

But from that day to this, the Electoral College has operated only in a technical sense. Its members regularly have only gone through the motions of voting as required by the Constitution.

"THE Electoral College cannot be defended. The only result of its existence is to increase the power of the comparatively few men who control national conventions. These men are not necessarily those who appear as delegates. The delegates often are only pawns, moved at will by the secret influence of selfish men and combinations of wealth whose identity does not appear on the surface. Their influence is apparent, but their identity is concealed. When they control both national conventions their work is complete. They must contribute to both sides in order that the party spirit may be kept alive and the millions of voters be kept active in sham battle, while the real perpetrators of the fraud are laughing behind the scenes. The machinery is oiled by those who are to be the beneficiaries, while the party spirit is cultivated in the rank and file to such an extent that the voter really imagines that he is having something to say about the destiny of his country. In the end the bills are paid by the weary taxpayer who has been induced to furnish enthusiasm and do the shouting for his own undoing."—*From speech of Senator Norris, of Nebraska, advocating the abolition of the Electoral College.*

This was true even in the early days of the country when there was no indirect "popular" voting for President. At first most of the state legislatures chose Presidential electors without reference to the voters. By 1832, all had made them elective by popular vote, excepting one, that of South Carolina, which continued to choose electors until 1868.

Frequently in the early days electors were chosen in the states by districts, thus causing a state's vote to be divided some times between different candidates. In recent times, however, electors have been chosen by the states without regard to the votes of separate districts. In 1892 Wisconsin went back to the district system, but after one election again abandoned it.

The early adopted system of nominating party candidates for President and Vice-President brought about the practical negativing of the Electoral College. The "Congressional caucus" lapsed into the national convention method still prevailing.

It is interesting to note that throughout this nearly century and a half's experience no Presidential elector has failed in the trust placed in him by his party. What would happen in case one or several should fail—that is, if electors chosen to vote for one candidate should by voting for another change the result of a national election—is one of the curious uncertainties adhering to this survival in form of a device that has failed in practice. Yet this might occur. It perhaps becomes more and more possible on account of the fact that the pure "formality" of an elector's duties leads those who select candidates for electors to be less and less circumspect as to the character of the persons thus chosen. The public rarely pays the slightest attention to the personality of candidates for electors.

Nebraska's Form Different

IN FACT, it is the custom in most of the states to place the names of candidates for President and Vice-President at the heads of the electoral ballots and to require only a cross mark to indicate a voter's choice. Sometimes those ballots contain the names of 200 to 300 proposed electors, depending upon the number of parties proposing Presidential candidates in the particular state.

In only one state, Nebraska, are the names of electors omitted from the ballot. There they are appointed, following the election, by the governor, who must select those recommended by the party organization whose Presidential candidate receives the highest number of votes in the election. This is the nearest approach made in this country legally to direct voting for President and Vice-President.

The party organization factor in the Nebraska plan indicates how our method of choosing a President has served organized politics. The vast technicalities it involves—for instance, the procuring of candidates for electors in the various states and getting their names on the ballots—make it all but impossible, as Senator Norris, of Nebraska, has pointed out, for an Independent candidate to run seriously for President, or for the voters to select some one who is not a nominated candidate. While legally anybody can run, and, usually, blank spaces are left on ballots for the voter to write in the names of any persons he may prefer for electors over those whose names are printed thereon, as a practical matter, only by means of a nation-wide political organization can a Presidential candidacy, no matter how popular, "get anywhere" at the polls. This condition is accentuated by other factors, somewhat growing out of and complicated by the "Fifth Wheel" of the National Government, that is, the Electoral College. These in the main are laws having to do with Presidential primary elections, which now take place in about one-half of the states. This phase of the subject will be taken up in another article.

Only a few times in the history of the country have serious complications arisen on account of the Electoral College method of electing the President. The first, of course, was the Burr-Jefferson imbroglio, referred to above, the fault demonstrated in that occurrence being corrected by a Constitutional amendment. On that occasion, as well as later, when John Quincy Adams won finally over Andrew Jackson, the election had to be referred to the House of Representatives.

The second and virtually the only other serious complications arose out of the Tilden-Hayes controversy in 1876, when the validity of the returns made by several states was disputed.

Inasmuch as the Constitution gives no direction for settling disputes of the kind that arose then, Congress assumed jurisdiction and referred the contest to the historic Electoral Commission of 1877. The result has left a blot on the country's history and the device then invented is not apt ever to be employed again.

In an effort to provide for settling future controversies, Congress, in 1887, passed what is now the law governing in the premises. It provides for leaving disputes to the states. That is, the decision of a state on a dispute over the result of a Presidential election in the state must be accepted as final. But if there be contending state governments, Congress, by concurrent action of the two houses, must decide which of them is valid. What would happen in such a case if the houses of Congress failed to agree, no one knows. Such would leave the Presidential succession "in the air," as happened for a time in 1876, and might cause a revolution as was threatened at that time.

Other complications have arisen and might arise again at any time. For example, in 1857, a severe blizzard kept the electors of Wisconsin from meeting on the day designated by law for voting for President. They met the following day, and, as the vote of that state couldn't change the result, the returns were accepted formally. Protest, however, was made; and if the same were to happen now and the votes involved be decisive, a very serious question might arise.

In Case of Death, What?

WHAT would happen in case a successful candidate for President should die between the November election and the meeting of the electors in January? Legally the electors pledged to vote for the deceased candidate would be free to vote for whomever they pleased. They would not be bound to vote even for their candidate for Vice-President. There is neither law nor precedent to govern in such a situation. One of the kind has never arisen, but at least one unsuccessful candidate for President and one for Vice-President have died before electors pledged to them could vote.

Thus, though in usual practice set aside, the Constitutional scheme for electing the President and Vice-President still is of great importance.

In the recent Congress, Senator Norris, of Nebraska, urged the submission of a Constitutional amendment abolishing the Electoral College entirely. His proposed amendment would require that Presidential and Vice-Presidential candidates be voted for directly in all the states, leaving the result to be computed on the basis of "unit" votes as at present. Thus each state's vote would still be counted in units of one for each member of Congress. This would obviate the objections made to a "popular" vote for President on a mass basis. The small or thinly settled states still would have more "say" per voter than the large or thickly populated ones. A voter in Nevada, for example, has several times the power in electing a President as is possessed by a voter in New York State. That advantage is offset, however, by the greater influence of many of the big states—on account merely of being large and at the same time "doubtful."

For many years nearly all writers on the subject have favored the abolition of the Electoral College.

There can be made one observation which puts forth a set-off to many of the dangers, both actual and possible, adhering to the Electoral College. It is the American's Anglo-Saxon genius for finding ways out of political dilemmas and his talent for adhering to form while, when necessary, ignoring the essence of even a Constitutional requirement. This is illustrated very pertinently by the history of the Electoral College itself. In most other countries, this institution long ago would have precipitated revolution—most certainly so under the circumstances of the great controversy between the Tilden and Hayes followers 45 years ago when a famous Democratic editor went so far as to issue a call for "One Hundred Thousand Unarmed Men to March on Washington!"

The existence of the form, however, together with other influences, has brought about intricate and confusing and difficult complications more of which will be told in the next article.

The Why and Wherefore of the Buffalo

Winter Blizzard or Summer Wind, American Bison Always Faces Storm

By F. J. CLIFFORD

This is the first of two articles. The second will appear in an early issue.

NEXT to the Indian, the thing that most interested me when I first went West was the buffalo, the great American bison. His swift disappearance from the plains has kindled many sentimental notions, but his extinction as a free roving animal was quite inevitable as will be shown.

In days before the white man left his heavy markings on the country, the buffalo easily maintained their numbers, though occasionally reduced by severe winters. But even in the most bitter winters their immense numbers were protection, as the weaker ones could shelter themselves in the midst of the herd, which formed a wall of living, warm fur about them.

The buffalo by nature is extremely wild and practically untamable; vicious in the extreme except when under a year old. Take the so-called "tame herd" of the Yellowstone Park—the work of guarding and caring for them is classed as one of the most dangerous a man can be engaged in, riders as well as the horses frequently bearing scars from the vicious horns of some ugly old bull. There would be more accidents but for one trait which the buffalo has in common with the rattlesnake, in that he gives warning before he strikes. When a buffalo is angry he starts wringing his diminutive tail.

In front view the buffalo appears as a magnificent animal with his massive head, beautiful curving horns and towering shoulders, but when you see it all taper off into the undersized hindquarters with that little insignificant tail, one feels as though the Creator began with a wonderful idea, but lost interest before finishing it.

In one trait the buffalo differs from practically all other animals, he faces the storm, be it a winter blizzard or a summer breeze. There are two reasons for this habit, the primal one being the continual fighting of the bulls to settle leadership of a band of cows. This developed the head, neck and shoulders. Nature therefore placed on these parts more protection in the way of thick heavy wool, to withstand the shock of battle. It is natural, then, for the buffalo to present this armor to the fierce blizzards of the plains. The second reason and perhaps the more vital is the prairie fire, the great scourge of the plains. The smoke of the fire can often be seen at long distances, or the first warning may come by a changing wind: by facing the wind, the herds become natural fire alarms.

The prairie fire is not like the scene shown in pictures. When it hits the hills it may go up swiftly, but it works down slowly, thereby retarding its flight. It does not roll across the land with great long flaming frontage, as so often shown in pictures. I have had a "head-fire," as it is called, sweep by me twice; each time it has come in a huge wedge shape, the point a mass of flames with a rolling, strutting sort of movement; then perhaps along the side-fire there develops another "head-fire," that sweeps by at a higher rate of speed and throws the former head-fire into a side-fire. Occasionally, a gust of wind may cut the fire off close to the ground, and then you will see a huge flaming ball of fire sail into the air some hundred and fifty feet, truly a terrifying sight, and never to be forgotten.

This will show that it is possible to avoid a prairie fire if one keeps an eye peeled toward the wind, possessing a keen nose and mounted on any kind of a good saddle horse. If you detect the fire in time, ride a little toward it and to the right or left of the oncoming head-fire; jumping your horse over the side-fire you will be perfectly safe. Of course, there are many "ifs" in this, such as a tremendous wind with heavy dry grass making the side-fire so large one cannot get through it with any degree of safety. At any rate it is clear why the buffalo continuously has his nose and eyes to the wind. When they see the first whisp of smoke rise over some distant butte, or sniff the pungent odor, away they go on their wild stampede *toward the fire,* but to the right or left. This they had to do, or they would never have reached their immense numbers. There have always been fires on the prairies, and I have never found any old-timers who have seen buffalo burned in the prairie fire; but I myself have seen mules, horses, cattle and even coyotes burned in them.

In crossing the buffalo plains, especially of Wyoming, Montana and the Dakotas, one sees hundreds of acres of pox-marked land, nearly always on slopes, and generally near drinking places. These were the old dusting beds of the buffalo. Standing with hind legs spread apart, a shoulder flat on the ground, the buffalo rubs and rips into the sloping earth. Tiring of this he lies down and rolls, but he never rolls over, the high arch of his shoulders preventing. Sometimes he varies this exercise with plunging at top speed into a cutbank, ripping and tearing with all his strength. This may be only a form of amusement, though it is more likely a subconscious habit for training his body to withstand the shock of future battles; the habit is indulged in mostly by the younger bulls.

The buffalo grazed many miles from water, and followed the deeply worn trails which one can still find in places. They followed these trails to avoid walking on the slick buffalo grass, which tired them unduly and lamed their feet. Old Texas cowpunchers tell of the troubles they have had driving cattle over the buffalo grass; the beasts would become so lame that they could scarcely be forced along.

This grass has a bad effect even on a motor car. I have driven one over it for long distances, with only a compass to guide me, and always had to have extra water with us, as the auto would overheat. Once we dropped into a buffalo trail, breaking our rear axle, and there we were 40 miles from nowhere, with mighty little drinking water, as that in the radiator was heavy with alkali. We walked the rest of the day and all night and the soles of our shoes became so smooth and slippery that skates and skis were as sandpaper in comparison. Our feet incessantly slipped the wrong way. We tried sliding down some of the slopes backward but it did not help much. Then we cut creases across the soles of our shoes, which helped a little. We saw a band of antelope, who gazed curiously at us then circled round to the right out of sight. A coyote would come occasionally into view, sit down on some bluff and gaze complacently at us, seeming to know we had no firearms.

The great plains Indians took their steady toll of the buffalo the year around, the vast herds being practically their only support, while many Indian tribes came from valleys beyond the Rockies to "buffalo," as they called it. The red man, when he had the chance, preferred to stampede the herd over some handy cutbank, figuring on a certain number injuring themselves, thus making capture easy. Failing in this he took the slower and somewhat more dangerous way of riding his pony up beside some galloping bison and driving the arrow, or spear, in just forward of the high heavy hip bones, this being the easiest and surest way of reaching a vital spot.

The making of a "buffalo robe," once so common, is an interesting process. The squaws split the hide with stone knives, then pressed it off with skinning stones, after which they cut holes around the edge, pegging it to the ground, where they hacked and mauled at it with their small, dull-edged stone axes, till it was beaten to a suitable thickness. It was then soaked with urine from the camp, which tans the hide. Later on it was softened with the brains of the buffalo, tediously worked in, till the whole hide became soft as a woolen blanket.

One of my most prized trophies is a buffalo robe, a tremendously big thing. The flesh side is painted—nine Indian warriors, mounted on their ponies, all done in the usual stiff Indian way, and, of course, in colors of red, blue, green and yellow. The loops are still in the edges of it where it was pegged down for tanning, and it is sewed with sinew showing it was made before the squaws were able to obtain the much-prized thread of the trader.

Robes were usually made of young cows, because the older ones, especially the bulls, often rubbed off large patches of the wool, making the hide unfit for anything but moccasins, leggins, travois slings and the like. The pictures that were painted on the robes sometimes represented some incident in the owner's life, or perhaps a crude history.

After the coming of the white man, robes were made up for trading purposes. For an extra fine robe, the Indian might get a cheap buffalo gun—a carbine type rifle, single shot, rim fire, large caliber and of short range. There was probably a definite plan of the government in supplying the Indians with this type of fire-

Suckers!

DAY after day the mail of THE DEARBORN INDEPENDENT brings stories of frauds and fakes until it seems that almost everybody in the country who possesses a little money has been snared by some "blue sky" speculative proposition. "If there is anything that should be shown up," it is this or that or the other thing, the letters say. "Why don't you do something quick to prevent this wholesale robbing of poor people?" is a frequent question.

It would seem that if people still continue nibbling at stock schemes after all the publicity which has been given to the precarious and dangerous nature of such propositions, little more can be done to save them. In one mid-western state after the farmers' war prosperity, high-powered stock salesmen went over the territory county by county and cleaned the farmers out of hundreds of millions of dollars, leaving behind a trail of mortgage foreclosures and general wreckage from which the present generation of farmers in that state will not recover. Did not the farmers know better? Of course they did. Did not the local bankers know better? Of course they did. But the curse of wanting something for nothing, of desiring to get rich quickly, of falling easily for the methods of the stock salesman seems to be upon all classes equally. Ministers are buying stocks on installments out of their meager salaries. School teachers are doing the same. There is not a community in the United States that cannot show stacks of worthless paper, that cannot tell stories of the perfidy of men who prey upon the confidence of the people.

If people go on believing that strangers are lying awake nights to make them rich, if newspapers go on accepting full-page advertisements of stocks that no business man would invest in—what can be done about it?

The people themselves are to be blamed as well as pitied, for the whole stock proposition has an immoral angle. A share of stock is really a license to collect a part of some workingman's labor, for it is not true that "your money works for you"—money can't do that; it is another man who works for you. Until people learn these things, until they begin to scrutinize their own conduct in the matter, there is little to be done. The most effective thing to do would be to show up the whole financial system which makes these things possible.

Reserves and Currency

THERE is a point of difference in the administration of the right of issue of currency in the United States and European countries whose systems form the pattern for the Federal Reserve. The Aldrich plan, rejected in the Republican Congress, was essentially the same as the system successfully put through the Democratic Congress during the early days of President Wilson's first term. It is modeled after the Bank of England, and the only important change lies in the division of the country into reserve districts. The argument for this change was that the elastic currency to be provided in case of fluctuating demand might be more equitably distributed. That redundancy in one section might follow inflation needed in another was the excuse offered for the feature of regional banks.

The fact that the power to relieve a given section without injury to another involves as well the power to distress one section without directly affecting a more favored one seems not to have occurred to the apologists for the change, but good judgment should recognize that it does, and that no rule of conduct should be possible that does not affect all sections alike. Thus it is certain any reserve center created should be for the entire country.

This argument does not affect the position of opponents of the Federal Reserve System in the least. That position is that the issue of currency should be in direct control of the government and not delegated to one or more private corporations.

While the operation of the delegated power of currency issued to private corporations is the same in nature here as abroad, there is a vast difference in its application. In the United States the percentage of issue to reserve is out of all proportion to that in England and the Continental countries of Europe. The claim by our financial masters is that undue depreciation of our currency must follow any inflation. That might be a result, except as to its being "undue," for such inflation might merely restore an equilibrium established in the war period, which has been disturbed by deflation.

At the close of the first quarter of the present year the Federal Reserve System of the United States held reserves of 76.3 per cent of its liabilities. At the same time the Bank of England held a reserve of but 19.64 per cent of its outstanding notes. The Bank of France has about 14 per cent of its circulation in reserve.

The improvement in business, hailed so loudly as indicative of the soundness of our own system, is coincident with a decrease in the reserve in the last year, which does not indicate the full measure of our currency inflation, since reserve holdings amount to more in the aggregate. That is, additional notes have been put in circulation in sufficient amount to reduce the percentage of last year's reserve and for the added increased volume of reserves.

The point we are demonstrating is that if England and France deem a fifth to a seventh of note circulation sufficient for reserve funds, the United States could increase its currency volume several fold without injury to the country. It might affect interest rates, which are but three per cent in England, but 95 out of every hundred persons would find that of benefit, just as they would welcome a reduction in house rentals or taxes.

Not One of Them Anglo-Saxon

THE New York *Times* is authority for the statement that of the three dictators of Europe not one is an Anglo-Saxon. "No one of them is an Anglo-Saxon, and no one has any particular sympathy with the political ideals which are supposed to inspire the Anglo-Saxon, as distinguished from the Latin or Slav world."

The key to the world is Race; the key to the future is Race; and as yet there are no authorities on Race which those who need light most on this subject will accept. Anglo-Saxon is a term which even in its broadest meaning is too narrow to define that gulf stream of racial quality which in all the ages has flowed down through the ocean of humanity, purifying it and fructifying all shores where it flows. The Anglo-Saxon has been the most prominent branch of that Race, but the stream itself includes even today (for example, among certain sections of the German people) those to whom the name Anglo-Saxon is anathema.

However, that is a big question. The absence of an Anglo-Saxon among the dictators of Europe means nothing. How securely are Poincare, Mussolini and Benes set on their dictators' seats? What have they been able to do singly or together for the problem of Europe as a whole? What profundity either of hope or menace do they signify? Is there anything in the Latin and Slav political ideals that holds out any promise for Europe? Latin or Slav, which has shown colonizing wisdom? And colonizing wisdom is just this—the possession of such an idea of civil justice as can be applied to any country or any people. It is not by accident, nor is it by political design, that the desirable places of the earth as well as the waste places have come under the control of one racial strain. When racial kinship is recognized, a number of national divisions are likely to fall away.

The future of Europe can be almost plainly seen—a gradually growing helplessness under present European ideals, a collapse of all the falsities which led to the present distress, and in the end an appeal to the ideals and materials of the Anglo-Saxon civilization for salvation.

They are crying for the materials now, but the materials are not enough, the ideals also must be put to work

Religion and Property

WILL H. HAYS, in his capacity as a Presbyterian elder, addressing the General Assembly recently, gave further evidence of that peculiar inaptitude which has come to mark most of his utterances since his elevation from political to public life. As the clerical assistant of the National Republican Committee he was no doubt a very useful man, and as the employe of the motion picture trust he is probably earning his salary, but as a thinker upon any kind of public question he evinces a strange inadequacy. At the General Assembly, for example, he spoke about religion as the guarantor of property. "The ministers," he said, "make certain the security of property, for if men cease to believe in God they cease to respect property."

That is just what the Bolsheviki and all violent social revolutionaries say. For years the fight against established religion has been conducted on the ground that it is the defender of a social system which no one claims is just. In Russia posted signs everywhere say that "religion is the opium of the people." That is why bishops are murdered and priests are starved in Russia—religion must be abolished if the new idea of property is to come in. Not long ago in America there was a Men and Religion Movement financed by capitalists who were notoriously unfair to labor, and the argument that moved ceaselessly through that campaign was that religion is a great thing to quiet the unhappy laborer and help him look to the future life for justice. Fortunately that campaign broke down. And the whole point of view breaks down, whether adopted by Presbyterian elders or Bolshevik atheists.

There can be no objection in any normal mind to the property end of Mr. Hays' statement. Property, if it be honest, is that into which a man has put his life. The workingman's bread is property and so is the cradle in which his babe sleeps. There can be no doubt at all about the sacredness of that kind of property and the duty of civilization to defend title to it. Every movement for the destruction of property rights, like that now existing in Russia, dwindles down to a lawless campaign for the transfer of property rights to those who have no moral or legal right to them. It goes along with this that any civilization worthy the name must render it possible for anyone to accumulate rightfully the property he may need.

But to justify religion solely on the ground that it serves as a social policeman is to cheapen it and unwittingly to play into the hands of its enemies. It is a claptrap statement anyway, and no man of weight would descend to its use.

It would be interesting to hear what ministers have to say about their being the guardians of property rights. The social statements of the great churches during recent years show a doubt as to just what constitutes property rights. It is a question with the church whether property acquired by theft, exploitation or in any way at the expense of social stability is sacred in any sense or has any rights. Certainly the ministry of religion does not regard itself as the guardian of that kind of property. It is coming to be its greatest challenger.

Their Name Is Wolf

YOU may rob the government and get off, but if you think enough of America to criticise the government too severely you may go to jail. We are very strongly set, as a people, against that deluded class whose principal crimes consist in verbal "hot air," against the young workingman who is temporarily a victim of alien socialistic mania, against the young collegian who is sowing his intellectual wild oats and having the time of his life fancying himself a rebel. But when big business men in time of war send socks to the soldiers that will not stand an hour's route march, send saddles to the army that will not stay on a horse and harness that will not pull a small load of ammunition or food to beleaguered troops in the front line—when this actual, practical and decidedly harmful treason is practiced, the guilty ones stand a very good chance of getting off. Those whose crime is only an unsteady tongue and a misinformed mind, must be punished to the limit.

Two profiteers of the kind just described were convicted in Illinois by government attorneys after a long and bitter fight. The courts fined the convicted men and sentenced them to prison. Then the wires to Washington began to work. Illinois Senators and others besieged the President for remission of the sentence. President Harding had the strength to refuse to grant a pardon but he did commute the sentences. And that is the kind of act which plain people cannot understand. There were boys shot at the front for doing things not one-millionth part as immoral or dangerous as those that the Illinois profiteers did. But their sentences were not commuted; they did not have any money!

The name of the profiteers is Wolf.

Mr. Ford's Page

THE severest and most dangerous poverty is to be poor in men. No bankruptcy that a country can face is so hopeless as bankruptcy in men. All other kinds of scarcity can be met and mastered, but scarcity of the human qualities of vision, wisdom and courage is fatal. Perhaps more people are conscious of this today than ever before, and the various conclusions they draw are the most effective influences active today upon the people's outlook toward the future.

What is it that is driving the people to entertain the thought that perhaps the nation is bankrupt of men? There is no doubt that it is nothing else than the apparent scarcity of high-class material in those regions where, for the last hundred years, we have looked for guidance. Our people, our nation has always looked into the regions of finance and politics for leadership. The man of oratory and the man of money were thought by the possession of these powers to be the natural leaders. It was very fine while it lasted and doubtless it served the nation during the period when those things were most significant.

But, being established as the leading classes, they attracted men whose ambitions were greater than their abilities and whose shrewdness was greater than their desire to serve. And so the personnel of those classes began to weaken in power and impressiveness. It was like a business which because of its success attracts all manner of people who are much more interested in the profits than in the welfare of the business, and so the business gets a bad name and begins to run down. We have so many men who can make speeches today and so many men who can make money that these accomplishments have ceased to be distinctive. That is, what were formerly the upper reaches of leadership are now somewhat shabbier and much less powerful than they were; the power has gone out of them.

So that, seeing this, the people jump to the conclusion that all the qualities of leadership in the country are going to seed and that there is no reserve left. And a country which gets itself into that state of mind is not in good national health.

It is time to look at the matter in what is probably a truer light. If there is one thing the history of our race, the history of our great ideas of religious freedom and political liberty should have taught us, it is this: peoples dedicated to justice and service are never bankrupt of men. The national reserve is always greater than we believe.

MAKE no mistake about it, the men are here for any need the nation may have. The leaders of the future are here, and if they are not now striving to enter public place it is because they wish to render service, which is not now possible in public office under present rules. They are waiting for the old system thoroughly to pass—but the men are here. That is one fact which our people should never allow themselves to be in doubt about. If visible public leadership seems blind and weak and all promises of service fail, just remember that among the people are all the men of vision and wisdom and courage that the people will ever need.

It is doubtless true that in official circles we are witnessing a great decline in vision and ability, or what seems to be that. It may only seem to be that. It is not improbable, however, that there is another element which we overlook. If things were still being done in the same old way, these men might not seem to us so helpless as they appear now. That is, if they had the same conditions to deal with as obtained fifty years ago, or if conditions themselves were as susceptible of control as they were then, these men might appear quite as able as their predecessors.

But even conditions are not as pliable to the old methods. We are approaching the end of a system of things, a system is irresistibly bringing itself to an end, and all the tactics, all the skill, all the determination productive of results fifty years ago are powerless as a child's arm against the immovable decree which has sounded the end of a certain chain of experience. The new time is pushing up under the old and the old personnel has not the knowledge how to help it. They are irresistibly being pushed aside by it. New things are to be done in new ways and our official circles belong, mostly, to the old. It may be this fact, therefore, which gives them the air of being more inefficient than they really are.

Now, if the nation were obliged to stand or fall by the ability of official circles to become proficient in the new order of things, the future would be very doubtful. But that is not the alternative. As the growth of the new leaf pushes the old one off the stem, so does the pressure of a new order of public servants gradually urge the old order into retirement.

The thing to bear in mind is that our official circles do not comprise the nation's wealth in able men. It is probably true that never were official circles less attractive to really able men than they are today. The nation's ablest men have been doing their work in other fields, and they have been doing more effective work for the nation than the government has been doing. Our country has not been built up by the government but by the people at work, under the leadership which various fields of service have developed. Government, it may be said, has latterly been much more of a hindrance to national development than a help. Why? Because the creative brains of the nation have not gravitated to politics. And the result is that outside the boundaries of official life we have the real public service of the land.

This great nation is not dependent on any one man. The day we pin our hopes on a man, that day we detract from our dignity as a nation. Perhaps in the past we have been too busy in worshiping reputations. It will do us good to look back ten or fifteen years and ask where the great names of that period are now. The men are here, but as their reputations were newspaper made and newspaper sustained, they fell as soon as newspaper puffing was withdrawn. They had never done anything before and they haven't done anything since; they were "men of the hour," so the promises said, but the hour is long since past.

Now, as a matter of fact, the national instinct has taught us that the nation does not depend on men. It is commonly granted that political campaigns are wholesale promising contests which are never to be taken seriously. The wholesale slump in the number of votes cast in our national elections is an indication of the fact that the people no longer take them seriously. But the time is coming when they shall, and the speed with which that time arrives depends on that very uncertain quantity, the patience of the people.

The people of this land are sufficient for their leadership. If the nation should ever take over the railroads, it is a foregone conclusion that the government as at present constituted could never run the railroads. The record of governments in business is not good, and if they depended on their success in business, and could not draw on the almost exhaustless resources of the people, they would long ago have been bankrupt. But on the railroads and among the people are the men who could run the railroads. *The men are here.*

That is the fact upon which the mind of the people may rest in utmost assurance—the men are here. They are here in sufficient number to carry on all the public processes. They are here in sufficient wisdom, honesty and courage to meet all the problems which an effete government faces helplessly.

But the men who are able to do what the country wants done will not play the old political game for the chance of doing it. They have too much wisdom to hope that anything can be accomplished by the old methods. They do not crave any honor which is bought at the price of wilful inefficiency in office. And while they will fight for the welfare of their country they will not fight for the tinsel of a public title. But when the hour arrives for free untrammelled public service, these men will move quite naturally to their places in the public service. The great thing to know is—The men are here.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

"Congress Lax in Not Checking Supreme Court"

"Our Duty to the People to Prevent Usurpation of Power; We Are Supreme Branch of Government," Says Senator Ladd

By U. S. SENATOR LADD

SENIOR SENATOR FROM NORTH DAKOTA

The third article by Senator Ladd will appear in an early issue, and will be the last of this series on the Supreme Court.

THE Supreme Court of the United States has decided that Congress does have the power "of making exceptions to the appellate jurisdiction of the Supreme Court," and in making such exceptions and regulations Congress can, virtually, limit the power of the court to its original jurisdiction. I think there is very little need for us to worry about the cumbersome method of effecting constitutional amendments. We have the power under the Constitution, and we not only have the power, but it is our sworn duty to preserve this power in the people. In my opinion, Congress has been immorally lax in its duty in quietly permitting the Supreme Court to assume various powers, and it is our duty to the people to see that an end is put to this gradual usurpation of power by the court.

The average American citizen is long-suffering and has a great deal of faith in his public officials, but mark the time when he realizes that his faith is being betrayed. The Supreme Court of the United States must not assume the attitude of believing that ultimate power rests in its hands, that it is not subject to review, that it is responsible only to the Constitution, and that the Constitution is just what the court interprets it to be. Under the Constitution, *Congress is the supreme branch of government* and the Supreme Court must depend upon Congress for a definition of its rights in the use of its appellate jurisdiction. Congress has the responsibility and must preserve this sacred power for the people.

The McCardle Case of 1867

ON April 5, 1867, Congress passed an act granting appeals from the Federal circuit courts to the Supreme Court in habeas corpus cases, which had hitherto been allowed in a very limited class of cases, and extended the power to "all cases where any person may be restrained of his or her liberty, in violation of the Constitution or of any treaty or law of the United States." *The real intent and purpose of this act was to facilitate the enforcement of the Reconstruction Acts designed to establish military control by legislative enactment in the southern states.* But the act was taken advantage of in a way that even its authors had not expected.

By virtue of this act the editor of a country newspaper in Mississippi, one McCardle, who had been arrested and held for trial by a military commission, for criticising the military activities of General Ord, petitioned for a writ of habeas corpus in the Federal circuit court, and after an adverse decision took an appeal to the Supreme Court. On January 10, 1868, Jeremiah S. Black, attorney for McCardle, moved the court to advance the case for a speedy hearing. On January 17, the court granted the motion and sent the case for hearing, the first Monday in March. On February 3, 1869, the Supreme Court, contrary to the expectations of the authors of the act of April 5, 1867, handed down the decision holding that it had jurisdiction in the McCardle case. At this time there was pending in the House an unimportant Senate bill to extend the Supreme Court's appellate jurisdiction to cases involving internal revenue officers and placing them on the same footing as customs officers. Unanimous consent had been obtained for its consideration, on the statement of the member in charge of the bill that it was merely a matter of routine. Mr. Wilson, of Iowa, then offered the following amendment which was adopted:

"Section 2. And be it further enacted: That so much of the Act of February 5, 1867, entitled 'An Act to establish the judicial courts of the United States, approved September 24, 1789, as authorizes an appeal from the judgment of a circuit court to the Supreme Court of the United States or the exercise of any such jurisdiction by said Supreme Court on appeals, which have been or may hereafter be taken, be, and the same is hereby repealed."

Vetoed by Johnson

THE New York *Independent,* commenting editorially on the passage of the amendment, said:

"The passage of that little bill which put a knife to the throat of the McCardle case was a splendid performance. Congress will not abandon its reconstruction policy to please any court, because it sincerely believes that the welfare of the nation depends upon the success of that policy. This Congress will not brook opposition from the court in political matters. The safety of the nation demands that Congressional Reconstruction shall be successful; and if the court interferes the court will go to the wall. This language sounds harsh to fossil ears, no doubt."

And the Springfield *Republican* said:

"Congress does not intend to permit the Supreme Court to overthrow it or revive rebellion if it can help it."

President Johnson returned the bill on March 25, without his signature, accompanied with a vigorous veto message. The following day the Senate passed the bill over the President's veto by a vote of 33 to 9, and the next day it passed the House by a vote of 115 to 57.

Mr. Schenck, of Ohio, chairman of Ways and Means in defense against the charge of Mr. Boyer, of Pennsylvania, that the amendment to the Act of February 5, 1867, was passed surreptitiously and that it was the object of the amendment to repeal the appellate jurisdiction of the Supreme Court in certain cases, said:

"The gentleman has alluded to the Supreme Court and to its jurisdiction, which he thinks it was the intention of this amendment to affect, as applied to the McCardle case and a conspiracy to undermine and destroy that court.

"Sir, I have lost confidence in the majority of the Supreme Court of the United States. Is not that plain enough? I believe that they usurp whenever they undertake to settle questions purely political, in regard to the status of states, and the manner in which those states are to be held subject to the lawmaking power. And if I find them abusing the power by attempting to arrogate to themselves jurisdiction under any statute that happens to be upon the record, from which they claim to derive that jurisdiction, and I can take it away by repeal of that statute, I will do it. Is there any indistinctness in that?

"Now, I hold that the judges of the Supreme Court of the United States, arrogating to themselves the pretension to settle not merely judicial but political questions and trampling upon the principle of the decision made in the case of the Dorr Rebellion, and upon every other decision of that kind, are, the majority of them, proceeding step by step to the usurpation of jurisdiction which does not belong to them. I hold it to be not only my right but my duty, as a representative of the people, to clip the wings of that court wherever I can, in any attempt to take such flights."

Chief Justice Chase: "The first question necessarily is that of jurisdiction; for if the Act of March, 1868, takes away the jurisdiction defined by the Act of February, 1867, it is useless, if not improper, to enter into any discussion of other questions. It is quite true, as was argued by the counsel for the petitioner, that the appellate jurisdiction of the court is not derived from acts of Congress. It is, strictly speaking, conferred by the Constitution. But it is conferred 'with such exceptions and under such regulations as Congress shall make.'"

Against 5-4 Decisions

"IN THE case of Durousseau vs. the United States particularly, the whole matter was carefully examined, and the court held, that 'while the appellate powers of this court are not given by the Judicial Act, but are given by the Constitution,' they are nevertheless limited and regulated by that act, and by such other acts as have been passed on the subject." The court said, further, that the Judicial Act was an exercise of the power given by the Constitution to Congress "of making exceptions to the appellate jurisdiction of the Supreme Court."

"What, then is the effect of the repealing act upon the case before us? We cannot doubt as to this. Without jurisdiction, the court cannot proceed at all to declare the law, and when it ceases to exist, the only function remaining to the court is that of announcing the fact and dismissing the cause. And this is not less clear upon authority than upon principle. It is quite clear, therefore, that this court cannot proceed to pronounce judgment in this case, for it has no longer jurisdiction of the appeal, and judicial duty is not less fitly performed by declining ungranted jurisdiction than in exercising firmly that which the Constitution and the laws confer."

The passage of a simple act such as has been proposed would mean the repeal of the clause in the Judiciary Act of 1789 which gives to the Supreme Court of the United States appellate jurisdiction, and consequently it would revoke the power the court now exercises to re-examine laws passed by the Congress and the 48 state legislatures of the Union, and to declare them null and void on the supposition that they are repugnant to the Federal Constitution.

Certainly *we should have no four to five decisions on Federal legislative acts. No Act of Congress should be declared unconstitutional unless by a vote of eight members of the Supreme Court* and no act of any sovereign state legislature should be declared unconstitutional by a vote of less than seven members.

One thing is certain and from this certainty there is no possible escape and that is that the Congress which enacted the Judiciary Act of 1789, never dreamed that it would be at any time so construed as to be the instrument of judicial usurpation, or that the courts would arrogate to themselves the power to nullify every act of remedial legislation necessitated by our prodigious industrial development and consequent growth of extortionate monopolies and law-defying trusts and combines.

Is it possible to conceive that the Congress of 1789 were so forgetful to the trust and confidence reposed in them by the people that they would transfer their supreme function to an irresponsible body, appointed because of their well-known, preconceived opinions in favor of the beneficiaries of predatory privileged corporations and prejudiced against the rights and interests of the producing classes? The members of the Supreme Court of the United States as now organized are in no way responsible to the people whose public servants they are supposed to be, and nobody is responsible for them. They are not always selected and appointed because of their distinguished legal attainments, their unselfish devotion to the people's interests. Often, these distinctions would be regarded as insuperable disqualifications in the eyes of the invisible power behind the appointing power. These public servants hold office during "good behavior," which translated into terms of modern political ethics may mean fidelity to the beneficiaries. Is it at all credible that the framers of the Federal Constitution and the architects of the Judiciary Act of 1789, and the very first Congress in its first session should unite in giving to this irresponsible body the power to paralyze the supreme function of the Federal Government and render all its legislation void and null and of no effect?

Is it believable that the legislative branch of the government would deliberately create a power superior to themselves and which could render their most important and painstaking work absolutely worthless?

Legislative Branch Supreme

IT MUST be admitted that under any and every form of representative government the legislative branch is the supreme function. From the very nature, essence and form it must be so. It couldn't possibly be otherwise and insure a true democracy. For a government in which the legislative branch is not the supreme function is not and cannot be representative. The members of the legislative branch are the direct repositories of the people's authority. It is to them that they have delegated their power to make the laws which it is the duty of the judiciary to expound and the duty of the executive to enforce. It would be an inversion of the natural order for the judiciary to have the power to annihilate the legislative department within the scope of its legitimate authority. The natural order in a true democracy is that the legislative department is the superior power of government, and, therefore, all other branches of the government are subordinate to it.

The legislative department have not the power to appoint the judges, but they have the power to reject the appointment of any person nominated by the executive. But they can do more than this. All legal justice is prepared by the legislative department and is transmitted to the courts to be distributed among the people according to the merits and demerits of each person. It regulates the practice of the courts, makes and unmakes the rules of evidence by which legal controversies shall be determined and furnishes the standard of decision for every cause. It defines all public and private offenses, and supplies a legal remedy for every legal wrong. All rights and obligations are secured and enforced in the way that they prescribe and, consequently, they cannot be either secured or enforced without their assistance. The members of the legislature are the accredited trustees and custodians of the people's property. They have plenary powers to sell it, give it away, or augment it by additional purchases.

The power of taxation, which of all the powers delegated is most liable to abuse; the power to issue and control the money of the country, the power of eminent domain, to appropriate private property for public uses and the many powers which these will suggest are conferred by the people upon the legislature. The reason for this is natural and easily discovered. The members of the legislature are directly responsible to the people for their public acts and would be relegated to political oblivion by their indignant masters for flagrant violations of their public duties.

"Against Common Sense"

A HIGHER consideration still, they are the guardians of public virtue and the criterions of political ethics. They may, indeed, command what is morally wrong and prohibit what is morally right, thus by embodying iniquity in the law, make the people workers of iniquity. But if a law is iniquitous in its conception and unjust in its operation, the remedy lies not in an appeal to the judiciary to declare the law void, but to the people themselves who have delegated their authority to untrustworthy representatives. It is to them they have intrusted their power, and not to the judiciary.

In the light of these preliminary observations, by what rule of interpretation, by what canon of construction, by what process of reasoning familiar to the rational mind can the conclusion be reached, that the legislative branch of the government could, even if it so desired, transfer to an uncontrolled body of its own creation the legislative function conferred upon them by the people? Such a conclusion would seem preposterous. It sins against common sense. It is without precedent or parallel in the annals of representative government. This indefensible usurpation has made this otherwise great and glorious republic an enigma among the progressive nations of the world. Let us look the facts squarely in the face, and consider to what pitfalls and dangers it has already led us.

Sharon Pays for Doctor Before It Needs Him

But Little Kansas Community Finds Its Unique Experiment Worth While

By E. B. CHAPMAN

THE young folks leaving the small town and the rural community for the city do not go alone. They are beginning to take with them the lawyer, the minister and the doctor.

In thousands of such communities in the United States today there is no physician. A minister can make trips once in two weeks or once a month. The lawyer sees his old clients in the city. But the doctor country people see is, in all too many cases, a man who doesn't know country people and their ways. They don't know him and they don't like the manner in which he handles the business of restoring health. They object strenuously to his prices.

But they have been growing more and more powerless to help themselves. The matter of becoming a physician has come to be hedged about with restrictions. Many of the better schools are requiring more and more preliminary work. The result has been to eliminate many young men who could not afford the time and expense necessary to become a physician. Those who complete the courses required feel they cannot practice in the country where collections are hard and rates are low. It is much more pleasant, in many cases, to go to work for some doctor, met while serving an internship, on a salary. It has been easy for the young physician to point out to himself how much more he could learn working for the city doctor than in a rural practice.

One rural community believes it has solved the doctor problem. Certainly it has a doctor, after being three years without one. It is not claimed for the plan that it will be successful in every community. Much depends on the community and on the doctor. In the case given the plan has, so far, been successful.

A nervous woman had a part in the solution. Mrs. E. E. Blackmore didn't like to live in Sharon, Kansas. There was no doctor there. She wasn't sick. But, long subject to heart attacks, she feared to reside in a community where there was no doctor. One of those attacks might prove fatal before the nearest physician could cover the 11 miles to the next town. She desired to leave Sharon.

Blackmore desired to stay. His business was prospering. He reasoned his wife wasn't sick and might not be. Perhaps she would get along all right without a doctor. Mrs. Blackmore, however, never became reconciled to life so far from medical aid.

One day Blackmore met Dr. E. S. Haworth on the train. The physician formerly had practiced at Sharon. He had a good practice as far as calls were concerned. But his patients seemed strangely unable to understand the first-of-the-month letters that went out from the physician's office. After two years the doctor had left Sharon to do post-graduate work. At the completion of that work he began practice in Wichita.

Before he and Blackmore met, however, the doctor realized the smaller towns suited him better than the larger ones. But, he argued against Blackmore's insistence that he return to Sharon, the town wouldn't pay him enough money to live on, let alone lay by something for the education of the doctor's family and his own old age.

Blackmore countered with the proposition that the physician had many friends in Sharon. Would he set a price on his services and give those friends a chance to bring him back to the town at a profitable figure?

From that conversation came the Sharon Health Association. It has 204 members, a chairman, secretary, treasurer and board of directors. The dues are $15 a year. In return for the payment of dues the members get medical attention without charge. Of the 204 members, more than 180 have had the influenza in the last few months. Their doctor bills would have mounted to more than the dues.

The dues are paid at the rate of $7.50, in advance, every six months. The officials pay the doctor a salary of $250 a month. He provides a motor car and buys the oil and gasoline. In case the roads become impassable for motor cars the patient must provide transportation. The doctor also is given, free, a telephone, an office, light and fuel.

Calls to all members living within six miles of the town are made without charge. Outside that zone a charge of $1 a mile from the zone boundaries is made. Obstetrical cases pay an additional fee of $10 which goes to the association. From that source the money is obtained to pay office rent, and for fuel and light bills.

Night calls are those made between 10 o'clock and 5 o'clock. For them the members are charged one-half the rate fixed by the state medical association. In emergencies, however, like the influenza epidemic, when calls came so rapidly the doctor worked late into the night making them, no extra charge is made. The physician is allowed to practice outside the association and the money thus obtained becomes his personal funds. If, however, a member of the association needs a physician while such outside calls are being made the physician is liable for the fee of a neighboring doctor who may be called in.

If hospital treatment is necessary the doctor accompanies the patient to the hospital for expenses. Provision is made for calling other doctors in consultation.

Such a practice is far from the beaten trails in the Middle West. But the men and women who settled Barber County, in which Sharon is located, were the kind that cared little for the beaten trails. The settlers knew they were going to a territory in which the Indians long had held meetings and dances at Medicine Lodge, 11 miles from Sharon. But that made no difference in their determination to settle there.

It was on a farm near Sharon that, in later years, there lived a fire-eating young farmer who proclaimed loudly and effectually the tenets of Populism. He urged an income tax and was branded as a radical. He insisted on the state superintending the insurance business and was the more heartily hated for the successful manner in which he espoused that proposition. He advocated many measures which caused him to be the object of suspicion and distrust in many quarters. Yet the Middle West today has adopted many of his suggestions. His name was Jerry Simpson, "Sockless Jerry," his defamers called him in scorn, and his supporters turned the term into one of endearment. And so Barber County never has shied at new trails.

LUMBER
YARD
LUMBER CO

DR. E. S. HAWORTH and Main street, Sharon, Kansas.

One result of the experiment at Sharon has been to do to medical treatment what the nation long has done with the schools. The member with few children or none has helped pay the doctor bill of the poorer family with many. The member with 10 children pays the same dues as the member with none. Children of the poor family get the same quality of treatment as those of the wealthier parents. Yet the dues are not a burden on anyone.

People in the town are fairly evenly divided as to religion. There is a division over politics. But there has been no difference of opinion, apparently, over the health association.

Another result has been to put to work in practical fashion the principles of preventive medicine. When, under the old system of charging for every attention of the doctor, one of the children complained of a sore ear it was given no treatment or a little sweet oil was poured into the ear at home. Now he goes to the doctor the first time he is in town. Thus a child may be saved the suffering and annoyance that goes with a running ear.

A few weeks ago Fred Lutes, a farmer, appeared at the doctor's office. With him was a child, a niece, who stayed at the Lutes' home and went to school in Sharon.

"I don't think she's sick, Doc," he said. "She seems out of sorts and I brought her in on the way to school."

"Well, you can take her back home," the doctor announced after an examination. "She has scarlet fever."

The child went home, was treated and recovered without any of the after-effects that make the disease the terror of parents everywhere. Under the old plan she would not have been taken to the doctor because she was not believed to be sick. Going to school she would have exposed virtually all the children in the community to the dread disease. As it was, not a child contracted the disease from her.

Bessie Gaddie is a school teacher in a district near town. Eight days after the opening of school last autumn she was stricken with typhoid. A brother went to teach for her. In less than two weeks he, too, was stricken. The disease was traced to a well and that source of contagion eliminated. But the teacher was in bed nine weeks and the brother almost as long. The doctor bill would have been $100, possibly $200, under the old plan. Under the Sharon plan it was $7.50, paid before the disease was contracted, and $7.50 more to be paid several months later.

But that is only part of the typhoid incident. There was fear of an epidemic. Immunizing typhoid serum was obtained at wholesale prices. It was administered free. The total cost was 50 cents per patient treated, the cost of the serum.

Then came an outbreak of diphtheria. It didn't cause the doctor much difficulty. Immunizing doses were given to 50 children at the cost only of the antitoxin.

A farm wife, getting up in years, visited the doctor's office.

"I'm not sick," she explained in an apologetic way, "but I can't sleep nights."

An examination revealed a high blood pressure that might have led to apoplexy. As it is, a treatment has been decided on that should relieve the situation.

Then there was the man, more than 60 years old, who came to the doctor's office and told of symptoms that annoyed him. An examination revealed diabetes in the early stages. Proper treatment, it is believed, will render that disease less harmful.

"Nick" also is a farmer. A few years ago while riding with a friend the motor car overturned. Among the injuries suffered was damage to an eye that left the muscles of that member paralyzed. The doctor's bill was a large one but "Nick," happy that he was left with one good eye, paid it.

Recently "Nick" drove his touring car into a wire clothesline, tearing the top from the car. When the straps broke the wire snapped back striking "Nick" just over the good eye, causing painful, and for a time, critical injuries. But "Nick" has a good eye, just the same. The doctor being near, it was treated quickly, lessening greatly the danger of infection. And the doctor bill was covered by what Doctor Haworth likes to call health insurance—the $15 a year dues paid for the entire family for the year.

Two years ago there was a great deal of sickness in the family of Jake Ketzner, a farmer. Much of the time William Goodner did the Ketzner "chores." Goodner refused to take pay for what he considered only a kindly act for a friend. Last autumn, when the association was being formed, Ketzner bought a membership for Goodner.

"I hope you never need him," Ketzner said. "But if you do here's your doctor bill paid for a year."

It developed this was Goodner's year for sickness. His family had influenza. That called for medical services that, under the old plan, would have amounted to more than $15. Then his small daughter fell, breaking her arm. The fracture was reduced and still the doctor bill was only the $15 paid as dues into the association treasury.

Martin Landwehr was as strong and healthy a farmer as any in the county. He was solicited to join the association.

"I don't need a doctor," he explained. "But I'll join just to have one at Sharon."

A short time later the horses Landwehr was driving ran away. When it was over Landwehr was on the ground, one leg strangely twisted and he was moaning with pain. The bone was broken at the knee. Four months later Landwehr was getting out on crutches. But his doctor bill was only $15 and it had been paid before it was made. Landwehr still has the health of the family cared for for a year for that same $15.

"Such a condition makes an easy relationship between doctor and patient," Dr. Haworth explains. "My patients are not worrying about my charges. So they consult me, generally, at the first sign of anything wrong. In that way I can prevent much sickness. I want them to stay well. Then my work is easier.

"My patients don't think I am running up a bill on them when I prescribe. They know it is to my interest to get them well as soon as possible. While I am not ready to say the Chinese methods of paying the doctor while one is well and stopping the payments when illness comes has my approval, I believe the preventive measures, made possible under the health association plan, are valuable.

"We have had virtually no deaths from influenza. One reason, of course, was that the epidemic was a light form of the disease compared to earlier severe visitations. The disease swept our membership. But credit, too, is due the fact that few of the patients took

An Old Trading Post Becomes a Prominent Port

Despite Her Moorish Towers and Spanish Haciendas Tampa Teems With Industrial and Commercial Energy

By GEORGE H. DACY

HOME of the Havana cigar industry, leading post of phosphate export, the seventh Gulf port in commercial importance on Uncle Sam's huge calendar, business gateway to prosperous and rapidly developing Southern Florida, Tampa, the most picturesque and beautiful city on the western coast of Florida, casts a delightful spell over all who come to her palm and palmetto-shaded drives and linger a while to enjoy a metropolis that is unique, original and different from all others. Tampa is a remarkable grown-up town that matured into a successful and bustling city only during the last score of years and even yet has been unable to figure out the ultimate limits of her tenth-inning development. For right now Tampa is in the throes of a building boom and a progressive development that would tire the talents of a soothsayer if it came to a question of predicating what the final results will be.

A few years less than four centuries ago, Panfilo de Narvaez in search of gold first sailed into Tampa Bay, being the pioneer white man to trod the shores of that vicinity. This beautiful bay, "Espiritu Santo," was deficient in mineral wealth. The Spanish discoverers remained only long enough to learn this. Then they bore away northward, wrathful over the time they had wasted and appreciating not at all the outstanding nautical importance of the bay they were abandoning. In 1539 came Hernando de Soto with an imposing armament of more than 600 men on a similar quest. He and his mates also spurned Tampa Bay as a potential El Dorado. And just because golden riches did not underlie the shifting sands of the Tampa neighborhood, the locality for the most part was neglected for the following 285 years. During that era, the native aborigines had the western coast of Florida pretty much to themselves. The only pilgrims that investigated the soils of what is now the city of Tampa were pirates of the Spanish Main who used those isolated shores as trusty hiding grounds for the booty which they ravaged from the Seven Seas.

The city of Tampa owns this beautiful hotel, one of the finest in Florida.

(C) Lurgert Bros.

It was not until four years after Uncle Sam purchased Florida from Spain that the adolescence of Tampa began. Fort Brooke was then established there to command Tampa Bay and to provide headquarters for the several companies of regular soldiers who were sent to those parts. It was from Fort Brooke that the ill-fated expedition under the leadership of Major F. L. Dade set out in 1837 during the Seminole War. This company was scheduled to relieve the harassed defenders of Fort King located near Ocala, Florida. However, it was literally shot to pieces by the ruthless, unscrupulous redskins before it reached its destination, all but one of the 117 men being killed. Fort Brooke was a center of activity throughout the Seminole wars, being an important strategic base for the American troopers. Subsequently, a few settlers came but they continued for many years to live in the shadow of the garrison. In fact, it was not until 1842 that a flood of immigration of any magnitude occurred. For the following 14 years, settlers drifted in in goodly numbers and by the conclusion of the last Seminole War, Tampa was beginning to attain commercial importance as the leading trading post of Western Florida.

Old legends and stories which characterize Tampa as a fishing village are incorrect, for it was as a center of barter and exchange that this strange city first began to acquire notice. The town soon developed into the mecca of settlers from scores of miles in every direction. Ultimately, lines of ox teams that extended far away into the back country were typical of every market day. It was not until five years before the initial gun was fired on Fort Sumter that Tampa elected her first mayor. There were no bridges across the Hillsboro River in those days. All the country traffic had to utilize ferry boats in crossing the river. Each ferrying outfit consisted of a flat scow large enough to carry a six-mule team and a two and one-half ton load as well as two skiffs for passengers. Horse racing was popular in the county even during those early days. The records chronicle one famous cross-country race of 23 miles. The loser paid the winner more than $1,000 in wagers as a result of this equine Marathon.

As late as 1875, Tampa was nothing more than a seaside village with a population of 500. The most desirable business property in the city sold for $100 a block at that time. It was not until a decade later that Tampa was linked up by rail with the outside world. Following railroad connection with Jacksonville, Tampa began to pick up in progress and population. In 1887, more than 800 citizens received their mail through the Tampa post office. At that time there was not a single foot of paved street in the city while the only fire protection was a nine-foot length of rubber hose.

An event of epochal importance to the town of Tampa was the establishment of her cigar manufacturing industry which was the first notable development consummated in her industrial upbuilding. Ybor City, named after one of the founders of the early cigar companies, owes her inception to the inauguration of the tobacco business. It is a town of foreigners who migrated to the Tampa neighborhood to engage in the cigar-making business. Ybor City is a "little Havana" on the mainland. Peopled by Cubans, Spaniards, Greeks and Italians, the city operates her own shops, theaters, schools, churches, clubs and entertainments. These picturesque people with their foreign customs and languages add much to the quaintness of Tampa.

The last decade has been the most wonderful in the history of Tampa, for during that period the city has developed with amazing rapidity. During the last 10 years the beautiful Bay Shore Boulevard—one of the handsomest driveways in the world—has been built, the Suburb Beautiful and the Grand Central residential districts have been reclaimed from cow pasturage and converted into sites for modern mansions of unique architectural design. An immaculate and imposing bridge has been built over the Hillsboro River and one of the finest municipal buildings in Florida has been constructed. The South Florida Fair, the greatest citrus congress in America today, came into being and from an unpretentious beginning in limited quarters in a city park, it has spread to where it now owns and operates as palatial and progressive an exposition plant as is to be found in Dixie.

Today Tampa ranks as the seventh port in order of importance in the Gulf district of the United States. Phosphate and lumber are the leading exports, while fuel, refined oil, tobacco and cocoanuts are prominent on the annual list of imports. The cocoanuts come largely from Honduras and Jamaica, being brought in like so much corn or wheat stacked in bins in the holds of the schooners or piled high on the decks. The nuts are sorted on arrival at Tampa, the "culls" and "rots" discarded and the good grade nuts packed in sacks and shipped by rail to the northern markets where they are sold and manufactured into shredded cocoanut, canned cocoanut and other products. The refuse nuts of this novel industry are used in Tampa for soap manufacture and as feed for swine.

The port of Tampa trade is chiefly carried on with the West Indies, Central America and Mexico with an important potential trade with South America just developing. The visitor to the Tampa docks is invariably interested in the tubby schooners with their spicy odors of the tropics and their cargoes of tropical fruits, plantains, mahogany, ebony, mahowa and cedar. A total of 557 712 long-ton cargoes were handled through the port last year, the great bulk of the outgoing vessels being loaded with phosphates. Florida controls three-fourths of the world's supply of phosphates and Tampa has the largest phosphate-loading equipment in existence. With the completion of Tampa's extensive Estuary development project and the completion of the 27-foot channel which the government dredges have been working on for many months, a tremendous impetus will be given to Tampa's water commerce. Tampa is the most accessible port of any consequence to the Panama Canal and unquestionably much of her potential shipping increases will find outlet through that inland waterway.

It looks as though the extensive traders of Tampa for several decades have been gifted with magical lamps like that of Aladdin which they had only to rub to invoke floods of business prosperity. Twenty-five years ago Tampa had a zero record as a center of production. At present, the city ranks fourth among all the municipalities of the South, with only New Orleans, Birmingham and Atlanta leading her in the matter of annual pay rolls. Tampa merchants and manufacturers now pay out more than $16,000,000 annually for the hire of workmen. Everything from home furnishings to caskets, from spaghetti to 12,000-ton steel steamships, from superior cigars to fine chocolates, soaps, mattresses and building brick are now made in the city which ages ago was a pirate rendezvous. Tampa has eclipsed all outstanding sprint records in her unprecedented rush to a position of importance in the industrial, commercial and business world. The aggregate building permits range from $4,000,000 to $5,000,000 a year. Tracts of land that are in comparative jungle and swamp today may be selected for reclamation tomorrow. A few days later an army of carpenters and mechanics will begin to raise substantial residences and business buildings. That is the Tampa system of progression, a method that is grooming this remarkable city as the future leading municipality of all Florida, with her 61 counties and her 58,000 square miles of area.

With 223 cigar factories, which last year manufactured and sold more than 435,000,000 Havana cigars, Tampa controls the trade of the entire world in this single commodity. The tobacco is imported from Havana, Cuba, the best tobacco in the universe being used for the production of the Tampa "smokes." Some of the tobacco is grown under artificial shades—large tents of cheesecloth protecting the produce from untoward wind, weather, storm and excessive sunlight. The more delicately textured and finer shaded leaf is used for wrapper purposes while the balance of the crop is used as filler. All the cigars are made by hand by adept and skillful Cuban and Spanish cigar makers who have learned the intricate trade from their forebears. Secrets of superior cigar making are cherished and handed down from father to son. Usually, each workman specializes on a certain size of cigar and devotes his entire life to the output of cigars of that shape and description. One can gain some idea of the remarkable development of the industry from the fact that in 1898, one of the pioneer years in the establishment of the business, Tampa circulated only 85,144,000 cigars. A decade later, the annual production had increased to 236,681,000 cigars. During the last 12 months the output advanced approximately 185 per cent above this figure. The great majority of the Tampa cigars are consumed

right here in the United States. Tampa is the home of more unusual and interesting clubs than any other city of her size in the United States. Ybor City, the cigar manufacturing suburb of Tampa, boasts the novel Centro Asturiano, the Spanish social center which has more than 3,000 active members. The charges are minimum, amounting to less than $1.50 a man per month. The gymnasium, natatorium, game rooms and reading rooms are rendezvous for the tobacco workers after their day's work is over. Membership also provides medical attention in case of illness and even treatment in a modern sanitarium. There are classes in English for the Spanish and classes in Spanish for the English-speaking. The institution has a banking department where deposits on savings accounts may be made after ordinary banking hours.

L'Unione Italiano, a benevolent organization of 800 Italians, also operates an elaborate club house where complete facilities are provided for the amusement and recreation of the members. It was begun some three decades ago as a society to assist its members in case of sickness and to render financial aid to the families of deceased members. A school is maintained where the Italian language is taught to Tampa school children, and the government of Italy provides funds for the upkeep of this school. These classes are auxiliary to the curriculum offered by the public schools. This curious club has proved of great assistance to the Italians of Tampa, inasmuch as it pays out approximately $35,000 a year in sick and death benefits.

The Circulo Cubano was organized in 1899 to protect and care for the Cuban refugees who emigrated to Tampa during the Spanish-American War. The original club house was destroyed by fire and was replaced by a fine modern building completed six years ago which contains a large gymnasium, theater, dance hall, library, café, reading and club rooms as well as schoolrooms. It is the meeting place for the thousands of Cubans who are employed in the Tampa tobacco factories. It is also a benevolent society, distributing alms among the needy Cubans of Tampa in addition to taking care of its members in sickness or health.

The Spanish colonies of Ybor City and West Tampa have access to two of the finest social centers in the state of Florida maintained by Centro Espanol, Tampa's oldest Latin club. Time and again this remarkable organization has outgrown its quarters. It now maintains two very large club houses in addition to a complete sanitarium and hospital. Theaters, gymnasium facilities, schoolrooms and recreational activities are the leading features of these Spanish club houses, the like of which are to be found in no other city in the country.

Bay Shore Boulevard in Tampa, one of the finest drives in the United States.

Checkers, chess and dominoes are played outdoors in the Tampa public park.

Hillsboro County courthouse and Tampa city building.

Tampa is probably the only city in the United States that owns a fine hotel, one of several of the most palatial hostelries in Florida. Years ago, this mammoth hotel with its Moorish towers and minarets was built at a cost of more than $2,500,000 in a beautiful park along the shores of the Hillsboro River in the heart of Tampa. It was a promotion project which was created to popularize the western coast country of Florida. It acquired and developed a marvelous tropical park covering more than 40 acres as an outdoor annex to what was then the finest public stopping place in the state. Some years ago, the city of Tampa was empowered by special act of the Florida legislature to purchase this valuable property for $140,000, a mere fraction of what the layout was worth. By law, Tampa is required to maintain the hotel and park in the best of condition for public service. The city is prohibited by state statute from ever selling the property. The hotel is leased annually to private parties who operate it as one of the leading hostelries of Florida. This hotel looks for all the world like a huge Moorish castle. It is almost worth a trip to Florida to stand and admire the beautiful picture which it presents with its wealth of palms and palmettoes, poinsettias, begonias and other tropical ornamentals—all offset by the clear and pure waters of the Hillsboro River.

Tampa is strategically located from a business standpoint, being the shopping and marketing outlet for South Florida, the most progressive and bustling section of the 'Gator State. North Tampa is the citrus section with its hundreds of miles of orange and grapefruit groves set out on rolling land that is dotted here and there with a goodly portion of the 33,000 attractive lakes that are legion among Floridan natural assets. The Florida Citrus Exchange, a marketing organization of the growers, has its headquarters at Tampa. The fruit is graded and packed at the individual groves and shipped as directed by this central association to all parts of the country.

Hillsboro County, of which Tampa is the county seat, has accomplished more in building permanent highways than any other similar unit of the South. Hillsboro was the first county in Florida to bond herself for $1,000,000 for thoroughfare improvement. Already she has expended more than $3,000,000 for road-building operations.

Tampa is the "tin can tourist capital" of Florida with a tent city of more than 400 motor cars and their 2,300 owners and tourists. The camp is subdivided into a city of 12 streets.

The Minimum Wage and Its Constitutionality

Judicial Nullification of District of Columbia Law by 5-4 Vote Brings Discussion of Steps Held Necessary to Meet Situation

By REV. JOHN A. RYAN, D. D.

"THE judiciary is beyond comparison the weakest of the three departments of power . . . though individual oppression may now and then proceed from the courts of justice, the general liberty of the people can never be endangered from that quarter."

Thus wrote Alexander Hamilton in his celebrated defense of the Supreme Court of the United States. (*The Federalist,* No. LXXVIII.) While the first of these propositions may be true in the long run, it has been proved incorrect more than once for a considerable period of time. The prediction contained in the second proposition may have been verified as regards *civil* liberty, which was probably the kind of liberty that Mr. Hamilton had in mind; but it has been more than once falsified as regards political and economic liberty.

A few days ago, there met in New York City a group of economists, public officials, lawyers, social workers and publicists, to consider the next steps to meet the grave situation created by the recent judicial nullification of the minimum wage law of the District of Columbia. All agreed that a bare majority of the Supreme Court had proved itself more potent than Congress, and had denied to the people the *liberty* of protecting the women wage-earners of the District of Columbia against economic oppression. By the same act of nullification, the Supreme Court had deprived the women workers of that very important and positive kind of *liberty* which consists in the opportunity of obtaining a decent livelihood. For the time being, then, both of the statements above quoted from Hamilton are contrary to the facts.

Law for Women Workers

BROOKS ADAMS is a descendant of that John Adams who was a distinguished member of the same political party as Alexander Hamilton, and who became the second President of the United States. In a brilliant and suggestive little volume published 10 years ago, Mr. Adams wrote: "I contend that no court can, because of the nature of its being, effectively check a popular majority acting through a co-ordinate legislative assembly, and I submit that the precedents which I have cited prove this contention . . . . The moment we consider the situation philosophically we perceive why using a court to control a co-ordinate legislature must, nearly inevitably, be sooner or later fatal to the court, if it asserts its prerogative." (The Theory of Social Revolutions, pp. 75-76.) Apparently Mr. Adams finds a fulfillment of Hamilton's statements concerning the comparative weakness of the court in the intervening century and a quarter. Nevertheless, it is to be observed that Mr. Adams uses the qualifying time clause, "sooner or later." The chapter from which the foregoing quotation is taken is immediately followed by one entitled, "American Courts as Legislative Chambers." Herein he cites a fairly long list of decisions in which the Supreme Court temporarily usurped the functions of the legislative department. Practically all of these instances have occurred since 1890. Speaking of the first of them, *Chicago, Milwaukee & St. Paul Railway versus Minnesota,* Mr. Adams declares: "When the Supreme Court thus undertook to determine the *reasonableness* of legislation it assumed under a somewhat thin disguise the position of an upper chamber, which, though it could not originate, could absolutely veto most statutes touching the use or protection of property . . . . In questions great and small, the courts vote upon the reasonableness of the use of the police power, like any old-fashioned town meeting. There is no rule of law involved." (Pp. 104-105.)

Is this the process by which five of the nine Justices have pronounced the minimum wage law of the District of Columbia unconstitutional? It would seem so. At any rate this is the most plausible explanation of that remarkable decision. In 1918, Congress enacted a law which prohibited employers in the District of Columbia from paying women and minors rates of wages inadequate to protect their health and morals.

Not Forbidden by Constitution

WITHIN a few months, the Minimum Wage Commission fixed the legal minimum at $15.50 per week in one industry, and $16.50 in two others, for experienced female workers above 18 years of age. For more than three years, thousands of women employes in the District of Columbia enjoyed very substantial benefits under this regulation. On April 9, 1923, a bare majority of the Supreme Court pronounced the law under which these rates were established null and void, because in conflict with the Federal Constitution.

Does the Constitution anywhere forbid Congress to enact a minimum wage law for the District of Columbia? It does not. A certain very general and elastic clause in the Fifth Amendment to the Constitution has been interpreted by the majority of the court as *implicitly* forbidding Congress to enact such a statute. There was no previous decision of the Supreme Court specifically sanctioning a minimum wage law. Some half-dozen state Supreme Courts had, indeed, declared such legislation valid for their respective jurisdictions. One of the state laws had been passed upon by the Supreme Court, but, as the Justices divided four to four, the action could scarcely be regarded as a binding precedent. However, the Supreme Court had sustained several statutes for the regulation of wages; for example, one which required that miners should be paid by the weight of the coal before instead of after screening, and another forbidding the payment of wages in advance. In the recent decision the majority of the court held that such restrictions upon the wage contract were essentially different from a minimum wage statute, while the minority, headed by Chief Justice Taft, seemed to think that there is no essential or constitutional difference between the two kinds of regulation. Hence, the question of direct authorization of minimum wage legislation, in previous decisions, must be regarded as doubtful.

The minority of the court found an indirect, or a virtual, validation of such a law in the numerous decisions of the court upholding limitations on the length of the working day. If, they argued, it is lawful to forbid a woman worker to be employed for more than eight hours, because a longer day is dangerous to her health, it is equally lawful and constitutional to require that she be paid a wage which will be at least sufficient to maintain her in health. The majority of the court rejected the parallel, and indulged in some subtle argumentation in the effort to prove that there is an essential difference between fixing maximum hours and minimum wages. In all probability, the great majority of ordinary persons will agree with Chief Justice Taft that the distinction between the two has no practical significance in the labor contract. Hence, the legal precedents would seem clearly to sanction minimum wage legislation by analogy and by implication.

Turning now to the question of previous decisions, which might specifically forbid the enactment of minimum wage laws, we find that they are conspicuous by their non-existence. The majority of the court cite a large number of decisions, but they do so in the effort to show the absence of positive authorization for the minimum wage law. They do not contend that any of these decisions, even implicitly, prohibits such legislation. It should be noted that the recent case involved no question of Federal versus State jurisdiction. The statute in question was enacted by Congress for the District of Columbia; consequently Congress did not need an express grant of power by the Constitution to exercise its legislative function. It can do for the District of Columbia anything which the Constitution does not expressly forbid. It can pass all laws for the District which any state legislature can enact for its jurisdiction.

Holds Principle Not Justified

THE specific precedents touching the question of the validity of minimum wage legislation stand, therefore, thus: They do not clearly authorize such a law in express terms, but they sanction it clearly enough by analogy, inasmuch as they approve regulations of the length of the working day. Neither specifically nor by implication do they forbid Congress to enact a minimum wage law.

Finally we come to the question of what may be called general precedents or general legal principles. They all relate to liberty of contract. It is upon this liberty, or right, that the majority of the court base their entire argument. They admit, indeed, that "there is no such thing as absolute freedom of contract." The doctrine of the court on this subject was stated long ago in the case of *Muller versus Oregon*: "This liberty is not absolute and extending to all contracts, and a state may without conflicting with the provisions of the Fourteenth Amendment restrict in many respects the individual power of contract." The doctrine of freedom of contract is not explicitly stated in the Constitution, but has been evolved out of those provisions in the Fifth and Fourteenth Amendments which declare that no person may be "deprived of life, liberty, or property without due process of law." In his dissenting opinion in the minimum wage case, Justice Holmes declares that a great expansion of the doctrine of freedom of contract has taken place within his own lifetime. The "innocuous generality" of liberty to follow the ordinary callings has been "expanded into the dogma, liberty of contract." In the present case, the majority of the court have given the dogma a further and extraordinary extension. This is their formula: "Freedom of contract is the general rule and restraint the exception; and the exercise of legislative authority to abridge it can be justified only by the existence of exceptional circumstances."

By this astonishing principle the majority of the court tests the constitutionality of the minimum wage law. The principle is not justified by any statement in a previous decision. In effect, it means that there exists an overwhelming presumption against any such interference with freedom of contract as that contained in the minimum wage law. Positive proofs of correspondingly great weight and magnitude must be brought against this presumption before the law can be shown to be justified on account of "the existence of exceptional circumstances." Whence are such proofs to be drawn, and where are these "exceptional circumstances" to be found? Apparently in economics, ethics, public policy, and, in fact, in every department of knowledge that can throw any light upon the question whether the legal minimum wage is a justifiable exception to the rule of freedom of contract. At least, this is the method which the majority of the court adopts in the opinion written by Justice Sutherland.

A definite legal rule is contained in the canon enunciated by Chief Justice Marshall, which is that the legislature may pass any law which aims at a legitimate end by means which are suitable and not prohibited. In the minimum wage decision, the majority admits that the end at which the law aims, namely, safeguarding the health and morals of women employes, is legitimate. The question between them and the minority relates, therefore, to the means adopted by Congress, that is, the legal minimum wage law. How far may the court go in determining this question? May it decide the issue on the basis of its own ideas of the wisdom or policy of the law? Again and again the Supreme Court has answered this question in the negative. *"The court may not substitute its judgment for that of the legislature."* Nevertheless, the court must take some notice of the adaptability of the law to meet the end. It must pass *some* judgment upon the "appropriateness" of the means. The prevailing practice of the court has been to accept as "appropriate" any means which the legislature embodies in a law, and which are supported by a fair amount of evidence. The proof that the means are conducive to the end need not be *convincing*. Their "appropriateness" may be highly debatable. In his dissenting opinion, Chief Justice Taft says that it is a disputable question whether the legal minimum wage is a remedy for the evil that it was enacted to meet; nevertheless, *"it is not the function of the court to nullify Congressional acts which are passed to carry out economic views which the court believes to be unwise or unsound."* Again, he declares that "there is very respectable authority from close observers" for the proposition that low wages are injurious to the employe's health, and that the court cannot say that Congress was unwarranted in passing the law upon the basis of this authority.

Rejected by Majority

THIS long-established rule of the court is rejected in the majority opinion. Not, indeed, in express terms, but implicitly and in effect. What the majority have virtually done is to demand that the "appropriateness" of a legal minimum wage to promote the health and morals of woman employes should be proved to a demonstration. The very large mass of facts and authoritative opinions submitted to them as evidence the majority waive aside with the dogmatic assertion that wages have nothing to do with either health or morality. The only precedent which they are able to bring forward in support of this arbitrary action is drawn from a decision which, as pointed out by Chief Justice Taft and Justice Holmes, has been reversed by a subsequent decision. In *Lochner versus New York,* decided in 1905, a bare majority of the court rejected as insufficient the evidence which the New York legislature had regarded as adequate to justify the ten-hour law for men employed in bakeshops. In *Bunting versus Oregon,* decided 12 years later, the same court by a larger majority assumed that the facts which moved the Oregon legislature to enact a similar law were sufficient proof that the statute was suitable to attain its end. In the minimum wage decision, the majority accept the earlier decision instead of the later as authoritative, and imitates its method of rejecting the evidence which the legislative body regarded as sufficient.

The second requirement of Marshall's canon is that the means by which the law seeks to attain its end should not be *prohibited* by the Constitution. Here we come to the heart of the question. It is in the application of this part of the canon that the terms, "arbitrary," "wanton," and "unreasonable," have been used in many previous decisions to define "due process of law." As already noted, the minimum wage law is not prohibited explicitly by the Constitution. If a prohibition exists it must be found in the "due process" clause, or rather in the interpretations of that clause which are described by the words, "arbitrary," "wanton," "unreasonable."

Much Explanation Given

ALMOST all the argument contained in the majority opinion deals with this question. The first 12 pages are mainly explanatory, relating to the history of the case, to court decisions which lay down the right of contract, and to decisions which the majority reject as insufficient to authorize minimum wage legislation. The six remaining pages do not contain a single reference to a decision, nor, indeed, to a judicial precedent of any sort. They are all occupied by arguments tending to show that the minimum wage law is an unreasonable interference with freedom of contract. The considerations advanced are drawn from several fields: from economics, from ethics, from public policy, from social philosophy. The significant thing about this part of the opinion is not that the economic doctrine is confused and in conflict with the facts of industrial life; nor that the ethical doctrine is opposed to the moral beliefs of the majority of our people; nor that the

Mystery and Romance Still Haunt Salem

Gables and Forsaken Wharves of Quaint Old Puritan City Still Hold Allurement for Visitor to Home of Hawthorne

By MAY B. WHITING

STRANGE how the mood of a city will persist down through the centuries as if some event of its youth had stamped its fateful imprint on its character! So it is with Salem. Witchcraft and the conquest of uncharted seas are the striking episodes of its story, and a flavor of mystery and romance still haunts the gables and forsaken wharves of the quaint old city.

The witchcraft trail is easy to follow. Start at the courthouse where you may read in the beautiful handwriting of long ago the trials of the witches, evidence sleazy as cobweb, but strong enough, when interwoven with superstition, to hang almost a score of persons. There is the death warrant of Bridgett Bishop, the first victim, and the pins, black and twisted, which were produced in court by those whose bodies were "tormented, pined, and wasted" thereby.

In the heart of the city stands the Witch House. It was once the home of Roger Williams before he was banished from the colony, and for 200 years the Corwin family owned and occupied it. Judge Corwin was one of the "witch judges" and in his house the preliminary examinations were held. We can imagine the frightened victims issuing from its narrow door for their wearisome stay in jail. Then followed the trial where every word and gesture was used against them, the shameful ride through the streets to Gallows Hill, the unseemly haste of the executioners, and the hurried burial wherever the crevasses between the rocks afforded scanty depth of earth.

Those were moments of keenest dramatic tension. Sometimes there were murmurings, almost of repentance, as when the pious minister, George Burroughs, recited the Lord's Prayer on the steps of the scaffold. But that zealot, Cotton Mather, moved restlessly among the crowd, its evil genius, urging no truce with the dark powers of the invisible world. Even the pastor of the First Church, Nicholas Noyes, appeared to take a grim satisfaction in the evil business. "How sad a sight it is," he remarked, "to see eight firebrands of hell hanging there!" On one occasion he reproved a woman as the rope was being put about her neck. "I am no more a witch than you are a wizard," was the bold reply, "and if you persist in taking my life God will give you blood to drink." Hawthorne made this picturesque phrase the curse which pursued the ill-fated occupants of the House of the Seven Gables.

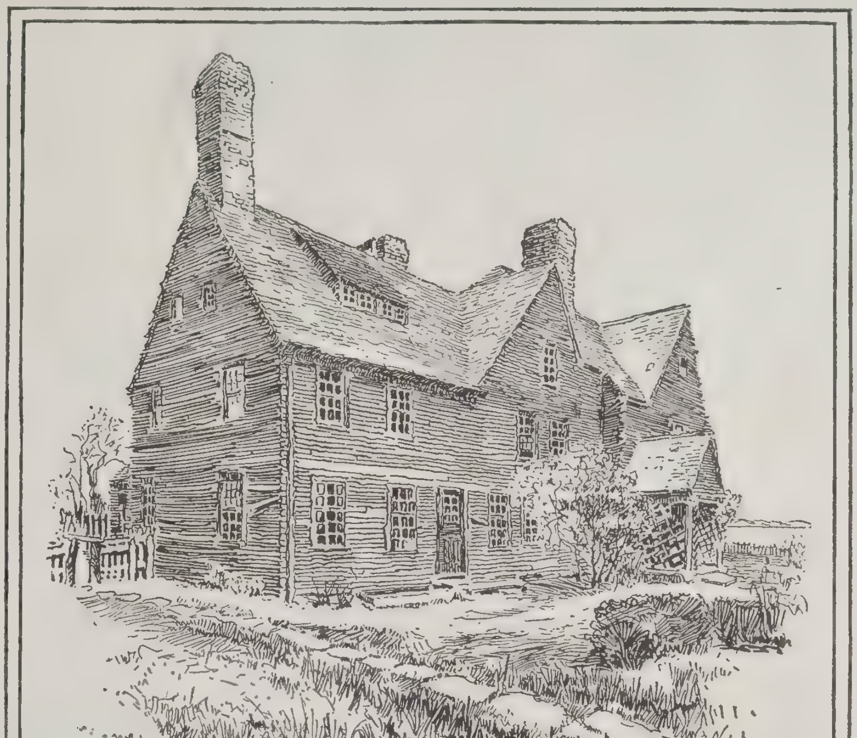
Hawthorne belongs peculiarly to Salem, reflecting on every page its somber mysticism and charm. In almost every corner of the city are places associated with his life. There is the old Union street house where he was born and the ugly house in Herbert street where he spent his solitary boyhood. His days were spent in a "dismal chamber under the eaves," dreaming and writing; by night he took long walks about the silent city. There is the customhouse where he worked for a few years and in a back room of which he claimed to have discovered the manuscript of *The Scarlet Letter*. On Charter street is the house where he met and wooed Sophia Peabody. It was love at first sight, and the lonely romancer, ignored, misunderstood, found a soul that gave him new inspiration and courage. The place has changed very little since he described it in *Dr. Grimshawe's Secret* as a "three-story wooden house, perhaps a century old," cornering "on a graveyard with which it communicated by a back door."

That graveyard is the old Burying Ground through which Hawthorne loved to ramble. In it are the tombs of Governor Bradstreet, of the "witch judge," John Hathorne (the novelist added the *w* to the family name) and Nathaniel Mather, younger brother of Cotton, "an aged man," as his tombstone records, "at nineteen years." There is also the grave of Captain Richard Moore, marked with a small dark stone, the only original monument to a Mayflower Pilgrim.

Most interesting of all the Hawthorne memorials is the House of the Seven Gables, set on Turner street, overlooking the bay. This house, begun in 1640, was once the home of the novelist's cousin, Miss Ingersoll. Hawthorne was fond of rambling through the old mansion and of musing in its deep-recessed windows. In its wide drawing-room he heard the story of the Acadian lovers which he told to Longfellow who wove about it his poem, *Evangeline*.

The house is still furnished in the delightful style of colonial days, from the pink luster ware in its shell-top cupboards to the four-posted field beds in its chambers. The garret is a veritable treasure-trove, as a garret ought to be. There is a gigantic palm leaf from India, an antique shaving set suggestive of the guillotine, and a meal chest over which the parson once prayed to remove the spell of dancing. In the depth of the chimney is what we believed existed only in story books—a secret stairway with entrances concealed by the panels of the wainscot and manipulated by a hidden spring, still in as good working order as when it was installed some two centuries ago.

In the rear of the house, in the garden, is set the old counting house and beside it the bakery with hand-split clapboards and hewn beams, ornamented roughly with augur holes. These three buildings give the impression, not of a bit of antiquity set under a frame, but of a past that was real and vital and which has left a heritage of good for us.



The House of the Seven Gables—an unfamiliar view.

That is the very feature of Salem which distinguishes it from other old cities, its expansiveness. There are whole streets where every house is of beautiful colonial design with classic porch, arched portal, and Georgian gateposts, all perfect models of their period. Salem boasts the finest streets, architecturally, in America and the greatest wealth of detail. The McIntyres were a family of builders and, from all over the country, architects come to study their grace and harmony of proportion.

It is easy to imagine, when standing beneath the shaded vistas of Federal and Chestnut streets, fine gentlemen in coats stiff with buckram, cocked hats, knee breeches and silver buckles, and women in satin brocade, with hair built high on crepe cushions, on their way to assembly at candle-lighting. It must have been a brave sight. At any rate the Father of His Country found it so, for he solemnly recorded in his diary that on such an occasion he saw at least a hundred handsome and well-dressed ladies.

Salem made the first armed resistance of the Revolution, although there was no blood shed. Gage sent out a company of men to capture some cannon hidden at North Bridge. The townspeople, who were just coming from church at four o'clock in the afternoon, refused to lower the draw and scuttled the boats near the shore. The young preacher, Thomas Barnard, besought both sides to use judgment. Finally the draw was lowered, the British marched over the bridge, countermarched, and returned to Boston, their mission unfulfilled.

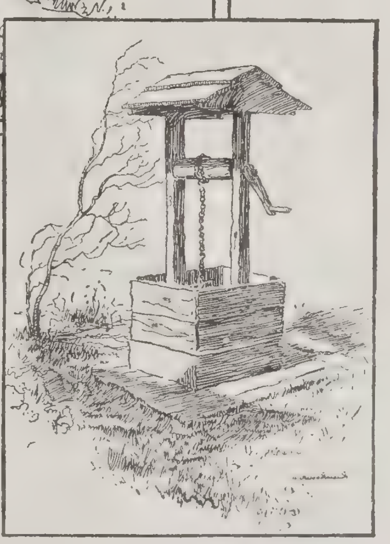
No city ever produced a more valiant set of men than Salem. Without maps, and over unknown seas, with no friendly lighthouses to mark the way, they made the New World known and respected all over the globe. No wonder the city's seal proudly bears the legend, *Divitis Indiae usque ad ultimum sinum,* to the farthest port of the rich East.

Salem boats were in Japan 50 years before Perry reached there; they were the first to carry the flag to Bombay and to Calcutta, and they opened up trade with Russia.

An inquisitive Yankee skipper found wild pepper in abundance and kept the secret, so that the whole world looked to Salem for its supply. A few months in the lives of these adventurers of fortune contained more thrills than a dozen "best sellers" of a decade ago. We read of a hard-headed captain who refused credit to the Queen of the Philippines for a bar of soap, and of General Frederick Townsend Ward who was given the red button and peacock feather of a mandarin and has a temple in China built in his honor and is worshiped as a god by imperial decree.

The days of Salem's maritime glory are over, but they have bequeathed a unique institution to the present. Those old captains were wonderful collectors. European visitors constantly marveled at the rare curios in their homes and the delicacies of the Orient on their tables. Late in the eighteenth century the captains who had navigated beyond the Cape of Good Hope or Cape Horn decided to gather their trophies in one place. The result is a collection not surpassed in some respects by the British Museum. Japanese students have visited it to learn of their own country during its feudal period. William Wetmore Story, the sculptor-poet, has tried to give an idea of its riches in verse:

"Tinkling pagodas strung with bells,
Carved ivory balls, half miracles;
  Strung necklaces of shells and beads,
  Sharp poisoned spears and arrowheads,
Bows, savage bludgeons, creeses keen,
Idols of hideous shape and grin,
  Fat, bloated spiders stilted high
  On hairy legs that scare the eye;
Great, gorgeous spotted butterflies,
  And every splendid plumaged bird,
That flashes through the tropic skies
  Or in the sultry shade is heard."



The old well, in the shadow of the gables.

This "Paradise of collections" is housed fittingly enough in the old East India Marine Hall, with the words *Oriental Insurance Office* and *Asiatic Bank* carved in the granite of its façade, perpetual reminders of departed glory.

Salem is singularly tenacious of its past. Not a few of the features of colonial life are repeated even in prosaic days like our own. Long before the Revolution a certain good dame, being left a widow, started in to make candy which she sold from the church steps. She evolved a hard confection which she called Gibraltars, and they were no disgrace to their namesake. The dainty and the name have continued to the present day and Salem urchins still buy Gibraltars to suck behind their books. And then Salem was always a city of little shops. Hawthorne, in making Hepzibah open the closed shutters of the House of the Seven Gables, was only depicting a bit of realism.

Salem gardens were famed throughout the colonies. The seventeenth century house in the Essex Institute has a garden with only the flowers which the housewives grew before the eighteenth century came in. And those same plots, where the yellow lilies and hollyhocks nodded to the passing Red Coats, flourish in gayer splendor than ever before. The rows of fine old houses, still inhabited by people of taste, with their gardens planted long ago and cultivated year by year with care, are a unique touch of beauty which no other city can rival.

And Salem, with all her pride in the past, is not ignorant of the gentle art of advertising. Today, where the main highways cross her precincts, she has placed "Community Boards" which call the visitor's attention to her architecture and her witchcraft memorials. A trifle bold, it may seem, to parade her charms in the face of every motor that whizzes by, but if they teach a few of the hurrying occupants that there is such a thing as beauty in simplicity, and that the past, with all its mistakes, is worth heeding, they will fulfill a useful purpose.

English Agriculture a "Sweated" Industry

Crisis Comes as Labor Finds Pre-war Conditions Again Taking Hold

By W. P. CROZIER

AGRICULTURE in England has been undergoing the severest crisis of modern times, and the worst sufferer is, as always, the laborer. Before the war agriculture was a sweated industry. It was less regarded than others which usually bear that title, because most of them were urban industries, carried on in the great industrial centers of population, whereas agriculture does not come under the eye of the townsman, who is mainly concerned with getting his food cheap. But "sweated" the farm laborers certainly were, seeing that in the southern counties of England the wages of an able-bodied man ran from 16 shillings to 18 shillings or 20 shillings (from four to five dollars) *a week* and on this miserable pittance he had to support his wife and family, which, according to the custom of the countryside, was usually large.

The war, we thought, had changed all that. England, it was found, could only produce enough foodstuffs for 16,000.000 persons, whereas her population was more than 40,000,000. The submarine campaign, attacking the imported stuffs by which she lived, threatened her with starvation. By superhuman efforts the growing of crops of all kinds was so far increased that at the end of the war England was herself producing food sufficient to support another twenty and a half million persons. This increase was produced largely by artificial means. The farmers were guaranteed high prices for their goods and, as a counterpoise, they were compelled to pay good wages to their laborers. A minimum wage was established and wages boards were set up which not only settled rates of wages but were empowered to enforce them. The laborer's weekly wage rose to 40/-, 45/- and 50/- (8 to 10 dollars). Almost for the first time in English history he had a wage on which he and his family could subsist not indeed in comfort nor in such conditions as to produce a strong and healthy race but at all events in decency, and above the semi-starvation level. The bad old days, we all said, were gone forever and we would no more let them return for the rural laborer than we would for the makers of cheap clothing or paper boxes or the other sweated occupations of the slum areas in the towns.

But the bad old days have returned. If anything, they are even a little worse than they were before. The downfall began with the slump in the prices of crops, which threw a heavy burden on the government. The government had guaranteed prices and prices fell. For some time the government (that is, the taxpayers) provided a heavy subsidy to agriculture. Then the government refused any longer to continue the subsidy and told the farmer that he must forthwith fend for himself. As he could clearly not continue to pay the increased rates of wages, the government abolished the minimum wage and the wages boards and substituted for them conciliation tribunals, which can arrange nothing except a voluntary agreement between employers and employes. Wages came down with a run, and they are still coming down. Allowing for the rise in the cost of living since 1914, they are now in some cases actually lower than they were before the war—when they did not constitute a subsistence wage. In Norfolk, where the laborers have just gone on strike against the latest reduction, some of them have only been enabled to live for months past by receiving aid from the board of guardians, the authorities who administer our poor relief. I take the following from a report published in October last, and the position now is worse than it was then:

"Agricultural workers in Norfolk have had their wages reduced from 30s. to 25s. a week, and many families are said to be on the verge of starvation.

"Walsingham board of guardians has just heard applications for relief from agricultural workers. One laborer with a wife and nine children was said to be obliged to maintain his family on bread and potatoes. He was already £20 in debt for bread. A team-man with a wife and 10 children received 31s. a week.

"Mr. George Edwards, M. P., expressed the view that many such applications would be received, and he would support them. The board granted 10s. a week in each case."

The Norfolk laborers have been working 50 hours a week at 6d. an hour ($5 a week). They are now being asked to work 54 hours at 5½d. an hour. Roughly, this is equivalent to between 14s. and 15s. (say $3) in pre-war values. It is, of course, a "starvation wage" and no wonder the Norfolk guardians are supplementing it. But it does not need demonstrating that such a system is rotten and demoralizing in the extreme. The laborers are being converted into "paupers"—kept by the poor rate. The farming industry, which like any other ought to pay a living wage to those whom it employs, is relieved of that responsibility, so that the inefficient and unenterprising farmer—and there are too many such—can follow the old traditional conservative ways, ignore the new scientific and co-operative methods, and pay as low wages as he chooses, secure in the knowledge that "the rates" will make up the deficiency to his wretched laborers. That is a fatal policy, if there ever was one—fatal both to the laborer and to the farmer and highly injurious to the whole community. It puts a premium on every sort of dullness and lethargy. How many farmers in a naturally conservative country like England will bestir themselves and meet foreign competition with brains and energy if the poor-law subsidizes them by maintaining their laborers?

It is not denied that the farmers have been, and are, having a bad time. There has been a tremendous slump in prices and, of course, wages "had to come down." But that is only to say, what we know to be the truth, that wages except for the boom period of 1919-1921 have been disgracefully low, to which we may add that such wages means poor and unintelligent laborers and therefore inefficient farming. They mean also that men will not remain "on the land" any longer than they can help; they either obtain other work in the country or drift into the towns. Even in 1914, while the agricultural laborer could only obtain a weekly wage of from 16s. to 18s., other laborers in the country districts could obtain about 24s. and in 1922 the farm hand's wage was from 30s. to 34s., while "other unskilled labor" was drawing up to 60s.

What is the remedy, if there is one? The obvious remedy, and the one which is always first favored by the farmers and landlords, is either a state subsidy or a protective tariff for the purpose of keeping out colonial and American imports. Mr. Bonar Law, the premier, recently told a deputation of both farmers and men most plainly that both schemes are now flatly impracticable. In a word, the towns now decide, and the towns will not have it. There is in the House of Commons at the present moment a Tory majority, and the Tory party is by inclination and tradition Protectionist in character and the friend and champion of the country interest. But it simply dare not grant a subsidy to agriculture nor set up protection. (The same conflict between town and country is to be seen in action today in many other European countries.) Our great landlords and noblemen are very angry about this. "It was the selfishness and ignorance of the urban population," said Lord Selborne recently, "that was going to ruin the countryside." It may be so, but Tory ministers have at least no doubt about the fact. These projects, says our minister of agriculture, "have been before the country, they have been fought out and, whether rightly or wrongly, they have been turned down." The prime minister adds bluntly: "I do not see any remedy. Agriculture must be self-supporting. Agriculture must live on an economic basis." The farmers reply simply that they cannot make a profit and that they cannot pay their laborers a living wage. The result is that from county after county comes the same story of wages sinking to starvation level until, as in Norfolk, the point of actual revolt is reached.

But if agriculture is henceforward to stand on its own feet, what consequences have we to expect? The farmers say the following:

(1) Low wages for laborers and an exodus to the towns.

(2) Less production and the conversion of arable to grazing land.

(3) Growing dependence of England on foreign foodstuffs, with the consequent danger in time of war.

But can nothing be done to avert these results? Some say that rates of taxation must be reduced but that is a national question. To discriminate in favor of agriculture is the same thing as to provide a state subsidy. Others declare that above all, railway rates must come down and certainly these rates weigh heavily on all industry. *To send a quarter of wheat by rail from York to London costs almost as much as to send it by sea from the United States to Liverpool.* But the probability is that the real hope for English agriculture is only to be found in a statement such as this:

"The way to the restoration of agriculture is in the proper application of scientific knowledge, the use of more efficient machinery and the employment of more competent and therefore more highly paid labor. None of these is immediately obtainable. In the first place they demand a much higher level of education for both farmers and laborers than the present generation has enjoyed or than the rising generation is likely to receive under present conditions. In the second place, the disastrous results of the last two years of falling prices, followed by the exceptionally bad season of 1922, have left the farmer without the necessary capital to employ the modicum of scientific knowledge which he possesses or to pay the living wage by which he can obtain efficient labor. To overcome this immediate difficulty an extension of credit on a large scale is essential."

Co-operative methods, better and more modern machinery, scientific knowledge, better paid and more intelligent labor (in a word, a higher standard of intelligence and education)—these are what agriculture needs, rather than poor-law relief, state subsidies and protection. Unless we can persuade agriculture to take this road, it must surely go down hill, and more and more we shall become a purely manufacturing people, dependent for our very existence on sea-borne stuffs. Meanwhile the laborer and his family come steadily nearer to the starvation line.

It should be added that some distinguished economists hold that the European countries, including England, have now passed the point at which they can support their populations in a decent degree of comfort and that, whatever steps be taken, a considerable portion of the population is doomed henceforth to live below the level of a "subsistence wage."

The Minimum Wage and Its Constitutionality

Concluded from page 10

conception of public policy is vague and rudimentary; nor that the social philosophy reflects the antiquated individualism of the eighteenth century. If the arguments employed by the majority of the court were *sound* under all these heads, the vital question of proper constitutional interpretation would be essentially the same. It is simply this: Is the court justified in determining the constitutionality of a law, is it justified in construing the "due process" clause, according to its opinions in the fields of economics, ethics, public policy, or social philosophy?

If the court has a right to determine whether a law which restricts freedom of contract is "arbitrary," "wanton," or "unreasonable," it must apparently give some attention to considerations of ethics and social philosophy, especially the former. When members of the court act upon the view that the legislature may not "unreasonably abridge the inherent and inalienable right to make contracts," their judgment, concerning the "unreasonableness" of a statute restricting freedom of contract, must be determined mainly by opinions of right and wrong, justice and injustice. In a case decided only last November, the court declared that the test of fair dealing and of due process was whether the legislation "shocked the sense of fairness" which the "due process" clause was intended to satisfy. In the minimum wage decision we find that the majority of the court have adopted this method and applied this test. Fully two-thirds of their argumentation is dominantly ethical.

Let us now sum up and evaluate briefly the procedure, as outlined in the preceding paragraphs, by which the majority of the court pronounced the minimum wage law unconstitutional. They rejected the authorization of minimum wage legislation drawn from previous decisions concerning statutes regulating the method of wage payments and restricting the length of the working day, while the minority found this authorization sufficient. They reject the judgment of Congress that living wages have anything to do with promoting the health and morals of women workers and they declare in effect that the minimum wage law is prohibited by the Constitution, inasmuch as it amounts to an unreasonable restriction upon freedom of contract. *Had the majority adhered strictly to the rule that a statute must be held constitutional unless its unconstitutional character is proved beyond rational doubt, they would have upheld the law,* upon the authority of the previous decisions to which reference has just been made. Had they been guided by a rule that the court may not reject respectable evidence for the suitableness of a law, they would not have asserted that the minimum wage statute had no relation to health or morals.

Two criticisms may fairly be passed upon the action of the majority of the court. First, they should have held the minimum wage act constitutional on the basis of those previous decisions which were surely sufficient to render the unconstitutionality of the law doubtful. Second, their application of the test of "reasonableness" in this case *constitutes the most extreme substitution of the judicial for the legislative will that has ever come from the Supreme Court.*

What is the remedy for this judicial assumption of legislative power? I assume that some remedy must be found because it is not desirable that the court should exercise such far-reaching power over the legislative branch of the government. When the court nullifies a statute on the ground that it is an unreasonable interference with liberty of contract, the fate of any such statute evidently depends upon the understanding of "reasonable" and "unreasonable" held by the individual justices. In other words, the constitutionality of such legislation depends upon the notions entertained by the members of the court upon questions of ethics, economics, public policy, and social philosophy. It is not likely, any more than it is desirable, that the court should continue to possess this broad power of making laws.

The simplest remedy is that contained in the proposal introduced in the Senate a few months ago by Mr. Borah. The concurrence of at least seven of the nine justices of the Supreme Court should be required to declare a law unconstitutional. This would meet both the defects in the minimum wage decisions; for it would give practical effect to the rule, which dates back to the time of Marshall, that the unconstitutionality of a statute should be clear "beyond reasonable doubt," and it would diminish very greatly the number of laws that would be nullified as unreasonable abridgments of freedom of contract. When four of the nine justices believe that a statute is in accord with the Constitution, surely its unconstitutional character is not "beyond reasonable doubt." When five justices are enabled to nullify a statute because they think it unreasonable, the fortune of the law rests upon too unstable a foundation. The proposed rule would neither take away the power of the court to declare laws unconstitutional nor limit its range of jurisdiction. It would merely safeguard the *exercise* of that power, in conformity with our political traditions, the welfare of the people, and the enduring authority of the court itself.

Concrete Canal Siphons Water to Thirsty Acres

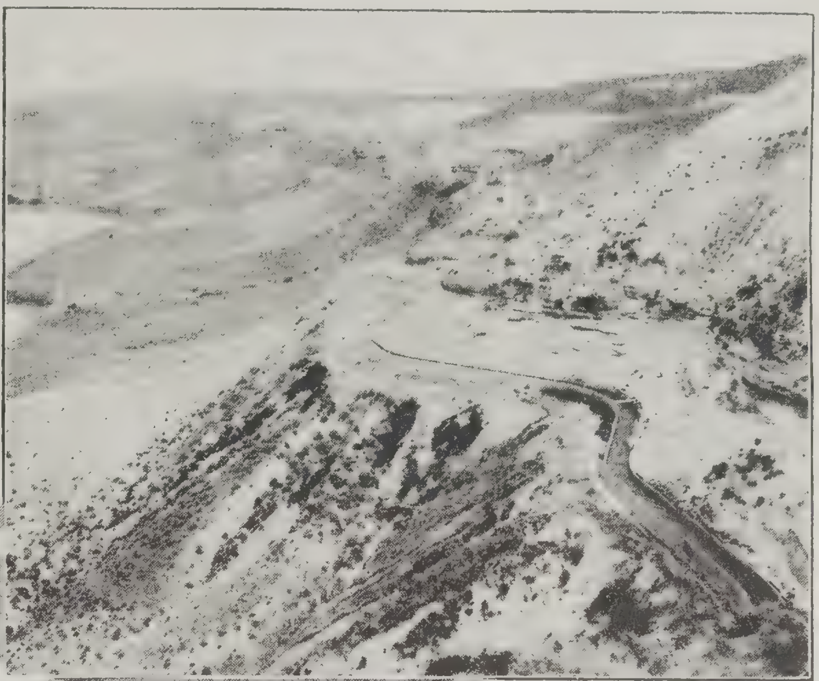
Gulches, Rivers and Creeks Crossed in Idaho Irrigation Project

By S. R. WINTERS

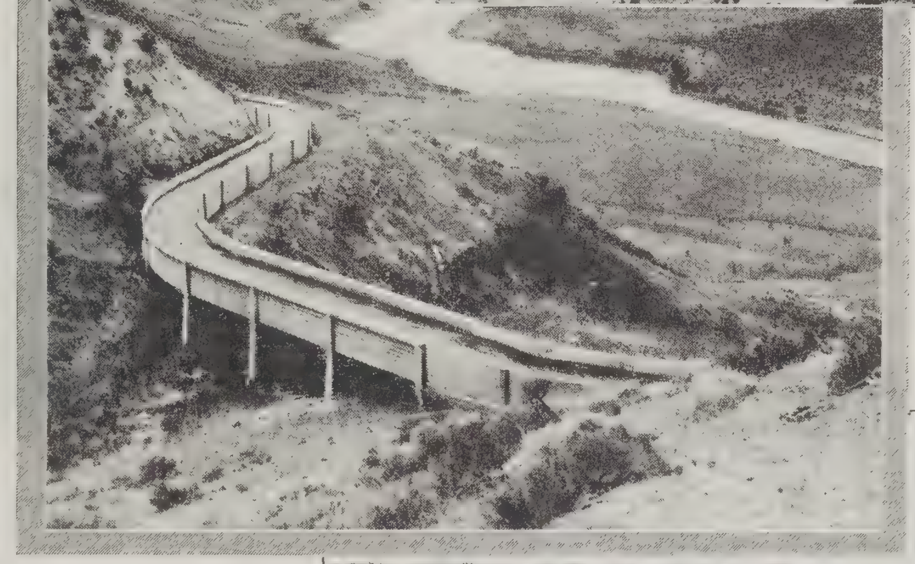
WHEN C. J. Blanchard, statistician of the Reclamation Service, United States Department of Interior, recently returned to Washington from a three-month pilgrimage through the far western states in search of material for exhibition at the Brazilian Centennial Exposition, he brought back photographic evidence of a new type of flume or channel for conveying water which has demonstrated its capacity for service in treacherous arid regions. Built of a combination of concrete and gunite, this form of canal is located in the Snake River Canyon in South Central Idaho, known as the King Hill Project. It is long and narrow, with the main canal 52 miles long. The canal system crosses divers deep gulches, creeks, and is four times siphoned across Snake River.

The "Valley of Siphoned Waters," is the picturesque phrase applied by Mr. Blanchard in describing this artificial watering system whose historical setting is on the Oregon Trail. The statistician of the Reclamation Service of the United States Department of Interior, in relating the manner of obtaining the photographs which illustrate this article, says: "We followed with camera from the great spring which gives birth to Malad River along the rim of the great wall of Snake River Canyon, the concrete-lined canal of King Hill Project. Truly a wonderful engineering work is this. For 13 miles it hugs a steep slope far above the great river blinking in the sunshine below. It crosses deep ravines and side canyons in enormous siphons of concrete and wood pipe, and four times spans the river itself. It is a splendid example of American engineering daring and skill."

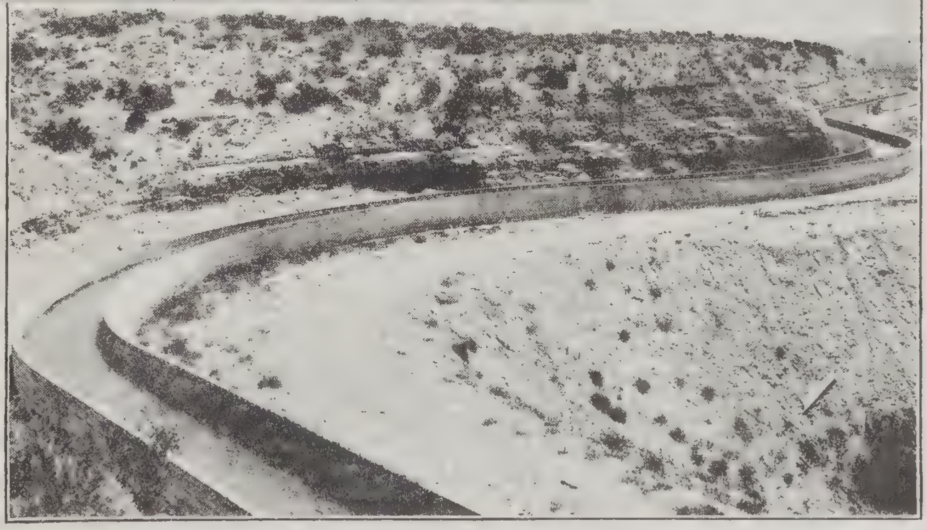
Five types of reinforced concrete flume have been subjected to trial experiments on this government enterprise in Idaho where an arid valley is being transformed into a productive agricultural area, famed for its gardens of fruits and flowers. The combination concrete and gunite flume, however, is of outstanding interest by reasons of its novelty and adaptability to treacherous foundations. A total of 3,300 linear feet of this strangely formed canal are in service on this reclamation project in South Central Idaho. The flume rests on an extremely insecure foundation and yet two years after its installation no settlement or disturbance of the foundation is discernible. It is water-tight and no erosion of the foundation is anticipated. The designing engineer characterizes this novel type of flume as having fulfilled all expectations and wherever insecure foundations are encountered this form of canal can be built to advantage. This water-conveying channel, fashioned from concrete and gunite, contains a floor five inches thick, without variation, while the side walls vary in thickness from two and one-half inches at the top to four inches at the bottom. The inside dimensions of this channel are eight feet and seven inches by five feet, and it has a capacity of 268 second-feet, with a free-board of one foot. The gunite included in the mixture was according to the ratio of one part cement to five parts of sand. However, since 20 per cent of the sand was sacrificed to rebound and scarcely any cement was lost in this way, the gunite in place is in the proportion of one to four. A highly refined concrete sand, obtained at the central mixing plant, was originally employed in the gunite composition. The rebound, however, attained the exceptionally high loss of 30 per cent of the total aggregate. It consisted chiefly of the coarser particles. Subsequent experiments indicated that the rebound could be decreased by the inclusion of hydrated lime, and this decrease is proportional to the quantity of lime thus employed, up to a ratio of one part of lime by weight to 10 parts of cement.



Four-mile gunite flume.



Concrete flume carried over a gulch on a concrete trestle.



Combination concrete and gunite flume, looking upstream; two miles long. This flume is without joints.

Structurally, this water-carrying channel which hugs treacherous slopes far above the river involved interesting engineering details. A double row of longitudinal reinforced steel was placed in the floor of the flume, thus affording a wider spacing of the bars. In the absence of this provision, the bars would be so closely knit together as to render difficult the proper placing and tamping of the concrete. The transverse bars in the floor bend at right angles and extend through the side walls which are reinforced as vertical cantilevers. Supplementary reinforcing steel was employed in the bank wall as a means of fortification from external pressure exerted by blow-sand accumulating behind the flume. The increased compressive strength of gunite when compared to common concrete permitted of a reduction in the section of the side walls at the base from five to four inches. Such a curtailment of thickness of the side wall operates to the advantage of reducing the quantity of longitudinal or temperature steel essential, as the amount of the latter is based on the percentage of the total area of gunite.

The twin brother canal—concrete and gunite—was designed with sufficient temperature steel to compel it to crack at intervals of six feet. This percentage was determined on the assumption that since the flume was built during the late autumn, the steel would be subjected to a temperature of 70 degrees. Accepting this figure as true, it was calculated that one-half to one per cent would be necessary when one-fourth-inch bars were used with an elastic limit of 55,000 pounds to the square inch. After the canal had been in operation for a considerable period of time, observations revealed the appearance of fine hair cracks at more frequent intervals than six feet. These fissures ordinarily occurred at 18-inch intervals, and at the points where the gunite area was reduced and weakened by the vertical transverse bars. The lower three inches of the side walls were fashioned from concrete and poured in conjunction with the floor of the flume. This created a curbing against which the forms for the gunite side walls could be placed and maintained in true position with respect to line and grade. A four-inch tile drainage system was provided. Compressed air, that versatile agent of engineering endeavor, figured in the construction of this concrete and gunite flume. Contrary to precedent, the air compressors were not spaced at intervals along the bench flume and moved as the activities progressed. Instead, they were stationed at a permanent location on the bluff above the canal-in-the-making, and compressed air was negotiated through pipe lines leading to the cement guns. The maximum distance at any time between the cement guns and the air compressors was 2,200 feet. The loss of air by transmission through such a long pipe was necessarily great, but in this instance, was unavoidable. The narrow flume bench precluded the customary practice of setting up the air compressors and transporting them from place to place as the work progressed. Neither was it practicable to move the compressors along the bluff above the flume. The cramped passageway afforded by the flume bench is further accentuated when we are told that no construction road could be built over which materials and equipment might be transported by teams. The location of the bench on a steep hillside rendered it inaccessible save when approached from each end. A miniature railway—a 36-inch gauge industrial railroad, if you please—was laid along the bench paralleling the flume. Over this artery of commerce, penetrating ravines and canyons, materials and equipment for building the flume were conveyed. The miniature railway extended to a central concrete-mixing plant, where a pit with an exhaustless volume of sand and gravel was uncovered. At this concrete-manufacturing establishment two mixers were installed, one to mix concrete and the other to form an amalgamation of dry sand and cement available for use in the cement guns.

The forms for the walls of this canal system constituted inside panels constructed of shiplap with an arrangement of cross-bracing to secure them in alignment. Since only one side of the walls was formed and no pressure was exerted by the gunite, the framework was simple and readily installed. A top templet only was essential to compel these panels to conform to the alignment, the bottom being held secure against the concrete curbing by use of spreaders between the panels. The gunite was sprayed or shot directly against the vertical wall.

When constructing side walls, the application of the gunite was begun at the bottom and was carried upward. The rebound was thus permitted to escape with minimum opportunity of any being buried in the wall. Gunite, exercising a tendency to build up upon whatever it strikes, could not be sprayed at right angles against the wall until the space between the steel and the forms had first been filled by shooting at an angle. Square bars were objectionable in this connection as it was found impossible wholly to fill in the space between the bars and the forms and insure that the bars were entirely imbedded. Experience indicated that the walls should be constructed in layers of from one and one-half to two inches, with a reasonable moisture content. Each coat is permitted to set before the succeeding one is applied. Long life and a minimum maintenance cost are among the virtues held out for this novel canal.

Shall We Kill?

By AUSTIN HAINES

IT WAS my unpleasant duty recently to be an official witness of a hanging at the state penitentiary at Ft. Madison, Iowa. For some time previously I had been waging a newspaper campaign to abolish hanging in favor of some less brutal and brutalizing form of capital punishment, such as electrocution or the lethal cell.

But standing within a few feet of the gallows when the trap was sprung, I felt no more revulsion than I would have before an electric chair as the current was turned on. Death was instantaneous from the seven-foot drop, although the heart reflexes continued for some 13 minutes before prison doctors officially announced the death. There was not so much as the twitching of a finger by the condemned man. Prison authorities told me this was typical of most hangings.

The details of the crime for which Orrie Cross was hanged are unimportant, save as they are characteristic of juvenile crime the country over, especially since the war, and as they raise the questions of society's joint responsibility and of the justification of capital punishment in general.

Orrie Cross, barely out of his teens when he committed murder, was born in a little Iowa town, of parents who were not defective morally, mentally or physically, as far as the record shows. They were just average midwestern ruralites, reaching neither the heights nor depths of responsible citizenship. At an early age he was left an orphan, and like Topsy, "just growed," receiving little attention or schooling and getting his "education" chiefly in the usual loafing places of the average country town. He wasn't inherently a "bad boy"—just weak and rather worthless, like hundreds of thousands of other boys hanging around temp bars and pool rooms all over this broad land of ours right this minute.

Then he drifted to Des Moines and fell in with Eugene Weeks, recently discharged from the army, with a good record as a fighting man, but a much poorer one so far as routine military discipline was concerned. Weeks had much the stronger mind of the two. It was he who planned the robbery of George Fosdick, substantial Des Moines grocer. He gave Cross the gun which killed Fosdick while the latter's daughter pleaded with the youthful bandits not to shoot her father any more, as he lay wounded at his doorstep. But Cross fired time after time in the panic of fear which police officers say is characteristic of the modern youthful criminal, especially when full of dope.

Weeks' common-law wife betrayed the two for the reward. Both confessed, though later repudiating their confessions at the instigation of their attorneys. Both were found guilty and sentenced to hang by the most merciful judge on the bench, who is also judge of the juvenile court. Weeks was hanged some time before Cross, going to his death with the bravado which criminals love, dramatically proclaiming his innocence and that of Cross from the gallows. Cross, far the weaker of the two, who prison officials predicted would have to be carried to the scaffold, faced death calmly, asserting that he had made his peace with God. He refused to discuss his guilt or innocence, but when I asked him at the last moment if he had any word to send to the young people of the nation, he said: "Tell them not to let themselves be influenced by bad companions"—which I took as a confession of his own part as well as that of Weeks in the crime.

An unsuccessful eleventh-hour effort, indorsed by the trial judge, was made to save Cross on the grounds that he had the mentality of a boy of 12—which is about the average of drafted soldiers as shown by the army tests. But regardless of Binet tests and technical opinions, the fact is that Orrie Cross had as much intelligence and ability to discriminate between right and wrong as those same hundreds of thousands of other boys, previously referred to, loafing in temp bars and pool rooms throughout the country at this moment.

That is the sordid setting in the case of State vs. Orrie Cross—or should it have been Orrie Cross vs. State? It leads to the question of whether our old theories of moral responsibility for crime are not often wrong. Should society permit boys who are weak—whether because of heredity, or environment, or both, I will not quarrel with Mr. Lothrop Stoddard—to develop logically into desperate criminals and then inflict the death penalty on them for it, while you and I, Mr. and Mrs. Respectability, thank God our children are not as other's children are?

To state the problem more concretely—supposing there had been a juvenile court in Knoxville, Iowa, before Orrie Cross started wrong, which had interested itself in his behalf, had seen to it that he went to school and had placed him under the influence of some good though unrelated "big brother"? Or supposing you and I, in the New Yorks and Knoxvilles all over America, were to show some sympathetic interest in the boys and girls growing up under similar conditions around us every day—would Orrie Crosses be going to the gallows weekly and police records show the average age of desperate criminals to be in the teens?

There are but four theoretical justifications for the infliction of punishment by the state. The first is reformatory, which obviously does not apply to capital punishment. The second is the idea of vengeance—that the majesty of the law has been outraged and it requires "an eye for an eye and a tooth for a tooth" to restore the equilibrium of the scales of Justice. This theory has been largely abandoned by penologists. The third is that the criminal is so dangerous that he should be removed from the possibility of further harm to society. To this the opponent of capital punishment replies that the same thing can be accomplished by life imprisonment, without pardon or parole, the negligible chance of escape being more than offset by the possibility of discovering later the innocence of the condemned person. Finally there is the argument on which it seems to me capital punishment must ultimately rest its case—that of acting as a deterrent to the commission of similar crimes by others.

That is a fair question upon which authorities disagree. Opponents of the death penalty deny that it ever deterred anyone from any crime and one of their classical examples is the fact that the greatest amount of pocket picking in the days of Elizabethan England was at the public executions of pickpockets. Advocates of the death penalty, on the other hand, assert that where it has been abolished murder has increased and where it has been restored it has decreased. My father was the author of a law which abolished capital punishment in Iowa for a time and author of the present law which later restored it.

Personally I doubt if the fear of capital punishment ever consciously deterred anyone from committing murder. Those who kill in passion do not stop to reason, while the deliberate murderer figures that he will be among the large majority of homicides who escape the death penalty. But it is the ultimate question involved in one's view of capital punishment.

There is one argument against capital punishment which I refuse to take seriously, although it seems to be the predominating one with that particular class of opponents, from Maine to California, who write letters to newspapers. That is the one used by slaves to literal Biblical authority for all their judgments of right or wrong. This was emphasized in the case of Weeks and Cross by the fact that the sheriff whose duty it was to spring the trap that sent them hurtling to Eternity is an ordained minister of the Church of Christ. He and the newspapers of Des Moines were literally flooded with protests against a minister of the gospel taking human life and practically all cited the commandment: "Thou shalt not kill." From total strangers the country over came pleadings that if the deed must be done it be delegated to one of the deputy sheriffs, as the law permits, thus saving "the cloth" from the shame. Perhaps the most bitter criticism came from the pen of Eugene V. Debs, in "The Appeal to Reason." But the "fighting chaplain" of the 168th Regiment of the Rainbow Division scorned such subterfuge, saying that it would not only not relieve him of any moral responsibility but that it would be cowardly for him to ask someone else to carry out the law which he had sworn to enforce.

To those numerous good souls who justify or condemn every action by Scriptural quotation, I would suggest that to the injunction, "Thou shalt not kill," handed down to Moses amid the thunders and lightnings of Mt. Sinai, they add Genesis 9:6, as one among many Old Testament quotations, where they will learn that "whoso sheddeth man's blood, by man shall his blood be shed."

And—which is more important—I would also add that the youthful "bad men" of the United States would not be so "bad" nor kill so frequently if they couldn't get their hands on guns and narcotic drugs so easily. Police officials of many cities tell me that most of the major crimes are committed by boys when under the influence of dope and "toting gats," which they ought never to have been able to procure.

We have state and Federal laws regulating the sale of narcotics—and they are of value in spite of the fact that they do not wholly prevent the illicit traffic. We ought to have similar laws regulating the sale of firearms—especially Federal laws, for state laws are almost worthless so long as such weapons are advertised and can be easily obtained from every mail-order house through the channels of interstate commerce. It's the most important thing that can be done to suppress major crimes of violence. Ask the officer on the beat—HE KNOWS.

But after all, the problem of juvenile crime gets back to one of social responsibility—what is society doing to prevent the reproduction of the socially unfit and what is it doing to develop its Orrie Crosses along right lines? I did nothing to help one such and therefore his blood is partially upon my head. That's why I said to myself, with him of old, as I stood upon the scaffold the other day: "There, but for the grace of God, hangs Austin Haines."

The Why and Wherefore of the Buffalo

Concluded from page 3

arm against the higher powered rifle of the soldiers and white hunter.

Buffalo flesh was usually jerked over buffalo chip fires, then stored away for future use. I might say here that the buffalo chip was nothing more nor less than the sun-dried manure of the buffalo. And this fuel was certainly a godsend to the early traveler and settler. Without it he would often have lacked fuel.

So different from the white man, *the Indian used all the carcass but the bones;* even the lowly entrails would be stripped of their contents, a piece wrapped around the end of a green stick and held in the fire till piping hot, when with smacking lips and much "Ah-hah-ing" the red man would swallow it down like a cove oyster—Hi-U kloshe muck-a-muck.

The buffalo's most constant enemy was the large gray wolf, sometimes called the loafer wolf, the lobo wolf, or the buffalo wolf, the name depending on the territory. Hanging around the outskirts of the herd he watched for animals crippled in combat, or a patriarch whose days were numbered, or a cow about to calve; he jumped in, dodging the wicked horns, quickly hamstrung his victim, and after eating his fill (sometimes done before the animal was dead) he left the remainder to the coyote, which modestly, perhaps wisely, waited for second table.

When winter snows lay deep and the cold had long since weeded out the weaker ones of the herd, the wolf pack became bold with hunger and made savage attacks on the calves. When too closely pressed the cows formed into a circle. With their sharp bristling horns on the outside they formed an endless defense that the wolf found exceedingly difficult to break through. If a cow was wearied by the vigil, she retired to the inside of the circle where were the calves, and some of the cows, one of which took up her place in the line. In this way they held off their gray enemies till their bellowing attracted the rest of the herd. The large circles trampled into the ground by these fights may be seen to this day.

American buffaloes were divided roughly into two vast herds, the northern and the southern, when seeking their wintering grounds. The southern herd wintered in the vicinity of Missouri, feeding north in the spring as far as the Dakotas and Montana, and returning when winter gave warning of its approach. The northern herd wintered in Southern Alberta, Canada. There they found the chinook winds, which in Southern Alberta are warm and dry. The effect of the chinook is magical. When prairies were held in the icy grip of winter, covered with two feet of snow, ofttimes with a heavy crust on it, and hungry animals could not paw their way to the rich bunch grass below, suddenly from the dark blue horizon of the west would come the magical chinook wind. In 15 minutes the mercury would rise from 15 to 20 below zero to 50 above, the snow disappear in a short time, the deepest snow melting in a few hours. The air was as in the spring, with this difference—there would be very little water running, it being absorbed by the warm dry air as by a sponge.

A change, no less magical, was seen upon the buffalo. The calves with lifted tails frisked about like lambs on a summer evening. This is the reason why the great herds of buffalo wintered so far north, traveling from Montana and Saskatchewan and Manitoba to Alberta and the chinook.

Sharon Pays for Its Doctor

Concluded from page 7

chances with colds. Their doctor bill was paid, the doctor was called early and given every chance to help nature overcome the disease."

There are some drawbacks from the doctor's standpoint, he admitted.

"If there is a profession or calling which has none I predict it soon will be overcrowded," the doctor said.

One of the drawbacks is that among the almost 1,000 persons in the health association (Rooseveltian families are fashionable about Sharon) there are some who are unreasonable. Not many. Not as many as usual. But some.

There are 30 business men in town, counting the banker, the barber, the merchants and the shoemaker. Every one is a member of the association. They approve the plan. It has brought business to town. When there was no doctor in Sharon much trade was lost when members took their families to another place for medical advice and treatment. Now they come to Sharon. They come all the more readily because the doctor bill is paid. And while in town they do the trading.

"We believe we have solved the problem of keeping a doctor, and in our case a good doctor, in a small town," Fred Leith, editor of the Sharon *Valley Times* and secretary of the association, said. "Our Constitution and by-laws may be lacking on some vital point. If so that point hasn't been revealed so far. But we had no guide. We tried to write a working agreement and as far as I know it has been satisfactory."

"If a doctor will be square with his people and they will be square with him there is no reason our plan should not work out in the average community," Dr. Haworth said. "I'm trying to be square with the people here. Generally they are trying, I believe, to be square with me. As long as that situation continues I believe we will be of help to each other. When that condition no longer exists the association will fail."

And what of Blackmore, with the nervous wife and the prosperous business? He has sold his business at a good price and has about decided to move back to Wichita.

International Science Briefs

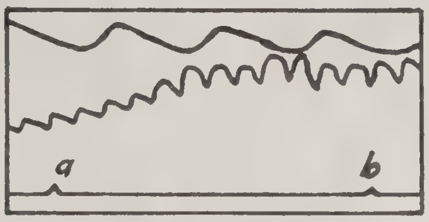
By DR. ARVID REUTERDAHL
President, Ramsey Institute of Technology, St. Paul, Minnesota.

Psychobiology—the Science of Mind and Life

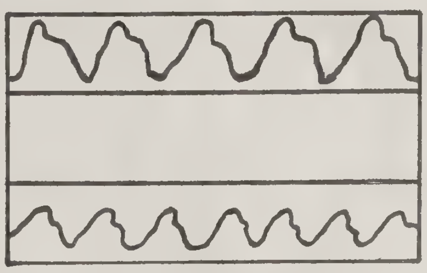
THE human body is the most wonderful energy developing and controlling machine in the universe. In this machine a central directive mental agency operates with utmost precision through a complex network of nerve-fibers and cells in the production of definite motion and action. The machine is capable of performing work of the most varied and intricate types. This ability to do work is a register and indicator of the machine's mechanical fitness and condition. From this standpoint the capacity to do work is directly proportional to the health status of the body. Years ago health was generally considered as being principally a physiological problem. The great majority of the physicians and surgeons of the old school were merely expert mechanicians who examined, repaired and oiled the members of the bodily machine. Little value was assigned to the patient's mental attitude toward his ailment. Many physicians of this old materialistic school stubbornly opposed and denounced all investigations as futile and ridiculous which had for their purpose the scientific correlation of mental attitudes and bodily health. A possible relationship was not admitted and therefore the study of this problem was considered as merely a wanton waste of time.

At the present time this attitude of medical science is almost entirely a matter of past history. The old school of medicine has given up its much cherished materialistic *"mumpsimus"* for the new mental *"sumpsimus."* Materialistic bias has been supplanted with frank admission that mind and matter are not isolated and separated by an impassable gulf. Quite to the contrary, the consensus of scientific opinion now favors the view that instead of isolation being a fact, an extraordinarily intimate relationship exists between mind and life in general, and the mental attitude and bodily health in particular.

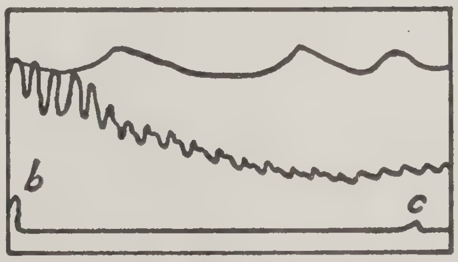
As a result of this changed attitude the comparatively new science of *psychobiology* has found a definite place among the accredited sciences, by the side of that other recent arrival *biotechnics* which was briefly discussed in a recent issue of THE DEARBORN INDEPENDENT. The science of psychobiology deals with the great problem of the nature of the intimate relationships existing between mind and matter. The psychobiologist finds it within the legitimate limits of his science even to question the existence of a relationship because the very word "relationship" seems to suggest the existence of two separate existence types, *mind* and *matter*. Many psychobiologists now hold that a living organism is a *psychophysical* being, a single entity, capable of expressing itself in a *twofold* manner, as a more or less sentient existence and a material being. Twenty-one years ago the writer, in a lecture at the inaugural meeting of the American Electrochemical Society, outlined his Theory of Interdependence which included as one of its fundamental doctrines that matter was merely a phase or manifestation of one basic activity principle. The writer then maintained and still contends that all being, organic and inorganic, is organized action in space and time.



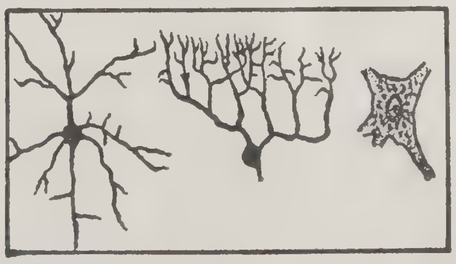
Curve of respiration during exciting happy thought.



Pulse curve during influence of optimistic faith.
Pulse curve during influence of fear.



Curve of respiration during sad, depressing thought.



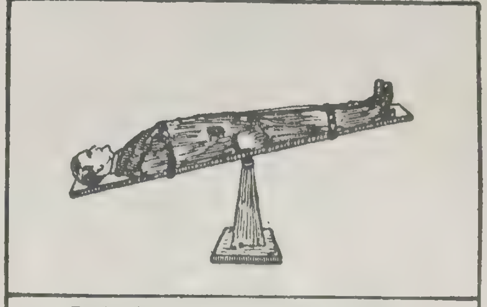
Nerve cells from the human brain. Figure at right shows cell-body only. In other two figures cell-bodies shown in black with thread-like processes extending therefrom.

This view serves as a sound and logical background for the science of psychobiology. From the experimental side, this science is supported by a formidable series of convincing investigations which have revealed facts of not only extraordinary interest, but also of unusual significance and value to mankind. The field of psychobiology is entirely too broad for proper consideration in a single article. We shall consequently confine ourselves to the consideration of that phase of psychobiology which deals with the effect of a mental attitude upon bodily health.

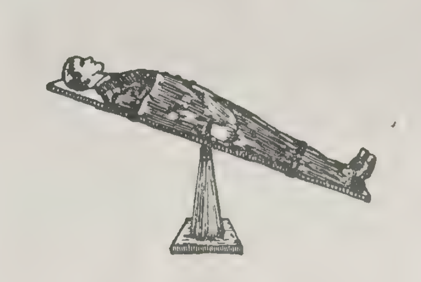
Psychobiological experiments have proved conclusively that the well-being of the human body is, in a great measure, dependent upon the mental attitude. One of the first problems investigated by the psychobiologists was the effect of the mental mood upon the circulation of the blood. It is a well-known fact that health and nutrition depend upon proper circulation. With this fundamental fact as a point of departure, psychobiologists began to investigate the behavior of the circulatory system during periods of sustained mental attitudes of concentration, attention, fear, cheerfulness, sorrow, optimistic faith, jealousy, hate and other states of mind which help to make up the content of conscious human life.

The following convincing experiment can be easily conducted by any one who desires to prove that the mind is effective in controlling the blood circulation:

An inexpensive balance, constructed out of ordinary boards, as shown in the figures, is all the apparatus that is necessary. The subject is strapped to the balance which is then brought into the horizontal position of equilibrium. Upon being requested to make some mental calculations which involve concentration, it will be found that the balance will begin to swing on its fulcrum or pivot in such a manner that the feet will ascend while the head descends. This experiment, which has been performed in many of our psychological laboratories, proves conclusively that equilibrium was destroyed by a flow of blood toward the head due to the mental attitude of concentration during the calculation of a problem.



Equilibrium destroyed by flow of blood to head while subject performs a mental calculation.



Equilibrium destroyed by flow of blood to feet while subject thinks intently about his feet.

If it is desired that the blood shall flow in the opposite direction then the attention of the subject must be directed to the lower part of his body. The experimenter first brings the balance once more into a horizontal position. Then it is only necessary to direct the subject to think about his feet. He can, for example, be requested to imagine himself in a jumping contest and that he is flexing himself on his toes in preparation for the leap into the air. After some time has been devoted by the subject to these thoughts concerning his lower extremities the balance will begin to move downward at the foot-end and upward at the opposite end showing that the blood has traveled toward the feet instead of the head which was the case in the first experiment.

Numerous records of blood pressure during various mental states help to substantiate the contentions of psychobiology. The average blood pressure of a normally healthy person between the ages of 20 and 45 years is about 125 millimeters of mercury. When the blood pressure is raised, more blood flows through the brain and other parts of the body. The blood is the stream of life and nourishes the body. While the blood pressure is moderately high the subject will feel a sense of exhilaration. Confidence, courage and hope will be in evidence in his mental states. Excessively low blood pressure is generally accompanied by a state of mental lassitude, weakness and debility. The mechanism by which the volume of blood is controlled is one of nature's mechanical masterpieces. The *medulla oblongata* contains the regulating center which controls the arterial nerves whose particular function it is to govern the size of the arteries thus adjusting the flow of blood in the different parts of the human body. Whenever excessive quantities of blood are driven to the heart, because of excitement or violent exercise, its cavities may become dangerously extended. At such critical moments the *depressor nerve* automatically signals the *medulla oblongata* to set in motion a complicated set of nervous and motor machinery by which all the arteries are distended thus permitting the overfull heart to discharge the excess blood into the arterial channels. The little *depressor nerve* is perhaps the most remarkable piece of nerve-mechanism in the entire body because it knows neither exhaustion nor fatigue. It is an ever vigilant guard driving danger away from the heart.

It has been demonstrated, time and again, that the mental attitude can set this entire complex mechanism in motion. The pulse is also subject to the influence of mental states. The graphical representations shown in the figures depict the effect of mental mood upon the pulse. Cheerfulness, faith, and an optimistic attitude are conducive to a regular, strong and slow pulse. Whenever the mental state is one of anxiety, depression, fear, or a pessimistic reaction to the problems of life then we find the pulse to be irregular and weak.

Respiration is influenced by the mental mood in as marked a manner as pulse. Contentment, happiness and optimistic faith are productive of regular, slow and deep breathing. Larger quantities of oxygen are taken into the lungs than during a depressed mental mood. The amount of injurious carbon dioxide discharged from the body is also greatly increased during periods of sustained contentment. When the mental mood is pessimistic and the subject broods, worries, and succumbs to fear, then the breathing becomes irregular, shallow and quick, with the result that the oxygen-intake and also the carbon dioxide-output is greatly lessened.

The stomach's secretions are lessened and often entirely suspended by anger, fright, worry, fear and disappointment. Happiness and an optimistic attitude, on the contrary, augment the flow and improve the quality of the secretions. Psychobiology conveys the message to us that cheerfulness and optimistic faith are the benevolent attending genii of medical science.

BRIEFLY TOLD

C. W. Barron, the noted financial editor, says in a cable from Jerusalem that there is not water enough in all that city to maintain the bathrooms of a good-sized modern hotel.

An eastern financial journal has brought to light an interesting bond. It is dated 1865 and was issued on a horse car line. The bond is for $1,000 and is carrying its third set of coupons, having been twice extended from its original maturity in 1880. Although the property has long since been abandoned the bond is still "going" at four per cent and is an underlying lien of the New York railways. It has paid $3,330 in direct interest. If all interest payments had been promptly reinvested at five per cent, the original investment in 1865 would have returned almost $25 000 up to the present time. From 1865 to 1900 the bond carried seven per cent interest.

A new explosive has been invented. It is a preparation consisting of sawdust and ammonium nitrate and it is possible to make it to sell at one-third the cost of commercial dynamite as neither of the two principal materials are expensive.

A new type of diving apparatus consists of a water-tight chamber mounted on endless belts similar to a caterpillar tractor. This is lowered overboard. The crew of the diver consists of two men. A power cable furnishes light and power and enables the machine to move about on the floor of the sea.

Because of the fact that dishonest individuals in religious disguise have by willful misrepresentation obtained from the government permits to secure so-called "sacramental wines" for pretended religious ceremonials, when such permits were in reality to obtain wines for commercial purposes, the trustees of Har Sinai Temple in Trenton, New Jersey, urged, in resolutions, action toward the revocation by the Federal Government of the privilege accorded Jewish congregations of using wine for religious purposes.

In the state of Texas, city and rural schools are to merge in all counties of 100,000 or more population. Taxes for schools will then be distributed justly and the standardization of the schools in all counties insures as efficient a school in the country as in the city. If any county desires to abandon the system it may, after two years' trial, by a majority vote, abolish it.

Dr. George Clarke Houghton, rector of the Church of the Transfiguration, better known as the Little Church Around the Corner, in New York, died recently. At one time the Little Church Around the Corner was a favorite resort of runaway couples, but Dr. Houghton drew up a set of rules requiring every such couple to produce evidence of parental consent before the ceremony. He refused to marry divorced men and women. During his pastorate more than 15,000 persons were married in the Little Church.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Introduced by accident in 1879 into the Bay of Southampton, at Hythe, an American plant, called the *Spartina Townsendi* has spread rapidly along the English coast, flourishing vigorously in spite of the fact that it is under water part of the time. The plant is an excellent fodder for cattle and may possibly be used for paper pulp. It may be introduced to the French coast to bind the shifting sands.

The deepest mine in the world is in Brazil at St. John del Rey. It has attained a vertical depth of 6 726 feet. At that depth the temperature of the rock is 117° Fahrenheit, necessitating a system of artificial cooling. The gold bearing ore at the bottom shows no signs of decreasing in volume.

The automobile has supplanted the camel as a mail and passenger carrier over the hot sands of Arabia. The car makes the trip in four hours that required an entire day for the usual camel caravan.

Representative Martin L. Davey, of Ohio, has a novel way of keeping in touch with his constituents. Mr. Davey has opened a temporary office in each of the counties of his district to receive the "complaints of taxpayers." He will meet his constituents, hear their complaints, and transmit them to Washington.

Resolutions protesting against the encroachment of private enterprise on the national parks in the western states were passed by the first national convention of the Izaak Walton League of America recently held in Chicago. The league is fighting earnestly to stop pollution of running streams, to halt deforestation and to save wild animals of all kinds, as well as to maintain an adequate supply of game fish. Certain interests are rapidly destroying the beauties of the streams and the wild life in the parks, and Congress will be asked in the interest of the whole people to stop further inroads by corporations of this type.

Ancient wall writings have been found in a hitherto inaccessible part of the Grand Canyon by a party of explorers. The discoveries were made about 50 miles from El Tovar, Arizona.

A Federated Press dispatch from Moscow announces the establishment of a new bank in Petrograd, which, like other Russian banks, accepts paper money deposits on a gold basis. That is, if a deposit of 50 rubles is withdrawn when it has fallen 50 per cent from the gold value when deposited, the owner receives 100 paper rubles for it. If the ruble rises he gets fewer on withdrawal.

A private in the United States Marine Corps can assemble a Browning automatic rifle in one minute and seven seconds blindfolded.

Sixty Americans are insured for $1,000,000 or more.

The ubiquity of the common micro-organisms, whether in the torrid zones or in the icy north and south, is phenomenal. Samples collected by explorers contain many familiar species of bacteria. In previously untouched soils and in the contents of the intestine of arctic animals, is found a motley group of bacteria, yeasts and molds, most of them familiar to us of the more contaminated zones. There is no escape from bacteria.

The inhabitants of the Fidsyi Islands in the Pacific South Sea believe that trees and cocoanuts have souls.

The ancient Incas of Peru possessed an efficient calculating machine in the "quipu." This instrument consists of a knotted cord about 16 yards long, containing 100 knots. These knots are divided into 10 unequal sections by as many silver beads, representing the odd numbers from 1 to 19. The sections are of different colors which were important factors in the calculating process. The silver beads between the groups represent the even numbers from 2 to 20. Calculations involving tens, hundreds and thousands are possible by this device, which was first used by the Chinese, later by the Japanese and must have been brought to America by Asiatic migrations in ages past.

CHRONICLER OF THE NEGLECTED TRUTH

Where Sweetening in Sugar-producing Goes: A Farm Story From Nebraska

Price of Product Soars But Beet Farmers Are in No Position to Benefit

By H. T. DOBBINS

WHILE the housewives of the country are being called upon to pay ten and eleven cents a pound for sugar, a price that is attempted to be justified on the ground of a shortage of 300,000 tons in the beet-sugar production of the United States, the North Platte Valley in Nebraska, one of the large units in that production, is listed on the statistical maps as being in the worst financial condition of any part of the nation, save New Mexico.

Representative men, like A. N. Mathers, speaker of the Nebraska house, and Senator Thomas C. Osborne, say that this condition is due to the refusal of the Great Western Sugar Company to pay the beet growers of the valley a profitable price for their crop, in spite of the fact that the financial reports of the sugar company show that it has a surplus exceeding by many millions the original investment in properties.

The growers are helpless because the Great Western is their only customer. They must sell to it or not at all. They have not the course open to other land owners of turning to crops that will pay them a return on their investment after the cost of operation has been deducted. Practically all of the holdings are irrigated land. The water rights on this land cost the owners from $40 to $55 an acre, and this, with the original price paid, plus the machinery needed, makes a total investment upon which no ordinary farm crop could pay a return. The heavy investment calls for intensive cultivation, and this means, very largely, sugar beets and potatoes. Last year many farmers did turn to potatoes, but the country overproduced the largest crop in its history and many acres in Western Nebraska were abandoned because the market price did not justify the expense of digging.

Farmers Losing Homes

EBEN D. WARNER, principal owner of the Platte Valley Telephone Company, which operates in that section of the state, recently said that because sugar beets have been the almost exclusive crop there, practically every farmer in the valley has been broken financially, and many of them are leaving their farms and losing them under foreclosure.

Mr. Warner's statement is substantiated by the records of Scotts Bluff County, which raises sixty per cent of the beets grown in Nebraska, and which, with Morrill, Sioux and Garden counties, supplies eighty-six per cent of the entire production of the state. Unpaid taxes in the county were recently totaled as in excess of $500,000. Most of the land is under the Pathfinder Dam irrigation project, fostered and financed by the government. It sold the water rights at $55 an acre on a ten-year payment contract. Because of inability of purchasers to pay, the government has made extension after extension of time. At the present time most of the contracts call for twenty-year completion of payments, made on an annual basis.

A computation made not long ago for the United States Reclamation Service shows that seventeen per cent of the water users are delinquent on their payments for 1919, or 240 in all, making a total due the government of $36,710. Four hundred and fifty-seven of the 1,400 farm unit owners under the government project are delinquent upon their 1920 payments, for a total of $99,000. The payments due for 1921 total $209,000, while of the $312,000 in payments due the government for 1922 but $32,000 has been paid, which represents practically 200 of the 1,400 who were able to keep up their payments.

This is not all. Farm mortgages totaling $3,850,000, which are second to the government lien, encumber the records. The local banks—two of them in the valley broke under the strain within the last year—have loans to these beet growers of $1,671,000, while local merchants are carrying them for not less than a quarter of a million, estimated. On the mortgages the growers are paying eight per cent interest, and to the bankers ten per cent, an annual interest-carrying charge of $475,000.

How Bonus Works Out

THIS condition has resulted, also, in the face of a constantly increasing tonnage of beets. The government project figures, for 1912 to 1921 inclusive, showed an average per acre of 10.96 tons. The tonnage for 1922 averaged 13.4 tons an acre, due to the unusually long period between killing frosts. Andrew Weiss, project manager for the government reclamation service, says that the 1922 crop was the best ever grown.

For this crop the Great Western contracted to pay $5.50 a ton, with a sliding scale provision that has since then added a dollar to that figure, with the promise or prediction of the sugar company officials that if the retail price continues in its elevated position they will pay an additional sum later. This sliding scale is drawn on the basis of sugar content and the price secured by the company for its product.

The criticism made by the growers of the operation of this scale is that the company has steadfastly refused to discuss profits or other intimate details of the business, so that, while the agreement is that the grower shall receive additional compensation based on the average net price it obtains for sugar, they must take the word of the officers of it as to what that net price is, since the retail price does not appear to govern. When the dollar bonus was declared some time ago the market price at Scotts Bluff was sixty-five cents a hundred more than in November last. George C. Porter, a lawyer and landowner of Morrill, who has been foremost in the battle to secure better treatment for the growers, says that when that dollar raise was announced the price was quoted to jobbers at $8.36, which means $8.86 wholesale to dealers, while the seaboard price was $7.05. If the market had been the determining factor, Mr. Porter points out, the company could then have paid about $8.02, as the contract when properly construed called for that amount with fifteen and one-half per cent sugar selling at $7 a ton. The percentage refers to the amount of sugar in a ton of beets.

Mr. Porter is quite convinced that the company paid this dollar bonus as a matter of policy, because of an experience he had during the war time. In 1918 the company was paying $7 a ton for beets, while the retail price was soaring. Mr. Porter called the attention of G. W. Wattles, state food administrator, to the spread, and his report finally reached Herbert C. Hoover, then in charge nationally. A committee investigated and a report was prepared recommending that the grower be paid $10 a ton.

The significant thing, said Mr. Porter, is that before this report was made public the company "voluntarily" raised the price to $10, its inquiry agents having tipped off to it what was coming, and it simply used the opportunity to make a show of generosity to the beet growers. At that time the local valley and the seaboard prices were lower than they are at the present time.

"The fundamental trouble afflicting us locally and aside from agricultural depression elsewhere is that the Great Western Sugar Company is taking an outrageous proportion of the wealth produced annually," says Mr. Porter.

His contention is backed by the financial report of the Great Western, printed in the May 5, 1923, issue of *Facts About Sugar,* the organ of the entire trade. The gross earnings from operations for the year were $8,056,992, and the net income, after depreciation and adjustment charges were deducted, was $6,789,114. The report does not state the amount of the investment in properties, but it says that the consolidated balance sheet shows current assets of $30,586,581, which includes $14,276,338 of sugar and by-products on hand as of February 28, 1923, leaving an investment, apparently, of $16,210,000.

Beet Cultivation Intensive

THAT this latter figure does represent the investment is further indicated by the fact that the dividend payments for the year were $1,602,500. That being true, then the net earnings for the year were 43 per cent. The company passed to its surplus account, as a result of the year's operations, the enormous sum of $5,200,000, as compared with dividend payments on stock of $1,602,000. Its surplus at the present time is slightly in excess of $25,000,000.

W. L. Petrikin, in his annual report to the stockholders, said that the company purchased nearly two million tons of beets, harvested from an area of 177,000 acres, at a yield of a little over eleven tons to the acre. The sugar produced was slightly in excess of five million bags of 100 pounds each.

The gross income from an acre of beets is large, but the cost of preparing the ground, seed, caring for the growing crop, thinning, cutting tops and harvesting foots up to a large figure. The experience of years has shown that beets cannot be successfully grown on the same land over a period of time. There must be rotation of alfalfa to rejuvenate the soil, feeding activities for fertilization and other plans followed, all with the object of better yields of beets. These operations must all go on at once, the farm being divided into sections each to take its turn.

The grower maintains that as these other activities fail, on high-priced land, to pay their cost, this fact must be considered in fixing what is a remunerative price for beets, since all of these are for the purpose of increasing the yield and making the whole proposition pay a profit. The cultivation, which is the hardest part, is done by Russians and Mexicans, together with some Japanese, who take up this work on contract—$21 an acre this year—move on to it in shacks or tents, and use all the members of their families in the work.

With only one market in which to sell his beets the grower has been forced, because the men who control that market refuse to pay what he says is a proper price and insists upon forcing a condition differing but little from that of peonage, to take defensive measures. Following the disaster of 1922, the growers organized. Public meetings were held, the bankers and business men declared themselves to be back of the effort to force a better contract, and a committee, thus encouraged, began negotiations. The sugar company was represented by officials and a publicity man. They refused the terms offered by the committee, and in the beginning refused to deal with anybody but the beet grower. All winter the battle waged. The company refused to do any better than $5.50 as the basic price, with the sliding scale contract attached. This contract provides for an equal division of all money received in excess of a basic figure.

The growers declared they would abandon beet culture for the year, and try their hand at some other form of agricultural activity. This did not influence the company representatives in the least. They knew that these lands must be intensively farmed, and that the farmer had only a choice between potatoes and beets. With the potato price outlook poor, they figured the landowners would be forced to plant beets. They looked at their $19,000,000 surplus, and a threat of an idle year for their factories did not disturb them.

The Nebraska growers acted in co-operation with those of Colorado and Wyoming, but in the end they had to yield. The only satisfaction they got out of the fight was the recognition of their right to collective bargaining. It did not, however, add a dollar to their returns on beets.

But the end of the battle is not yet. The legislature, which has just adjourned, forged a new weapon for the growers. It is the same which United States Senator R. B. Howell, as manager of the municipally owned waterworks of Omaha, has employed successfully to secure lower rates for electricity for lighting and power uses in that city. It is that of public competition, where private capital refuses to engage in enterprises occupying fields already pre-empted.

Three years ago the farmers of the state undertook to supply this competition. They organized a corporation to build a factory. They had, however, but fairly started on their stock-selling campaign when deflation struck agriculture, and the enterprise had to be abandoned. Now they propose to try public competition.

Has Paid Heavy Dividends

UNDER the law which will become effective August 2, next, authority is vested in the freeholders of any county or counties in the state that desire to do so to organize a sugar mill district, just as irrigation districts are created. Upon the petition of ten per cent of these freeholders, the secretary of state shall call an election in the proposed district to vote upon the question of whether to establish such a district. If sixty per cent of those voting, which must number at least two-thirds of the freeholders, vote in the affirmative, the governor shall issue a proclamation which will have the legal effect of creating such a district.

Directors elected are commanded to make a full investigation of the matter and if they recommend that a sugar mill shall be erected, a bond issue shall be submitted upon a ten per cent initiative petition, and if two-thirds of the landowners vote in the affirmative the bonds shall be sold and the proceeds used in erecting a factory. This law makes it a taxing proposition to meet bond interest, and thus gives the securities a standing that it is believed will insure their ready marketing.

This weapon is to be employed first as an argument for reasonable prices for beets. If the sugar company remains adamant it is proposed to go ahead with the public ownership proposition. It is believed that with one factory paying a higher price for beets and thus furnishing competition for the four Great Western mills in the valley the company will have to increase its prices. If this fails and the publicly owned mill proves its value as an investment, other factories will follow, organized on the same lines.

Mr. Porter submits a calculation of profit, based on the wholesale price, as this article is being written, of $9.50: "Based on figures given by the company some years ago, the cost of manufacturing sugar and of the beets is $3,657 for 100 pounds. This leaves a margin of $5.84 as their present gross profit on that amount."

The Great Western is a combination of a number of sugar companies, operating factories in Colorado and Nebraska, effected in 1905. It has outstanding $15,000,000 of preferred stock, of which a little over $5,000,000 is owned by the American Sugar Refining Company. This stock has consistently paid a seven per cent dividend, and $1,050,000 of the $1,602,500, paid in 1922, was on the preferred.

How It Links With "Street"

AMERICAN Sugar Refining directors are Earl D. Babst, Charles Francis Adams, George H. Frazier, Albert H. Wiggin, George F. Baker, Jr., James H. Douglas, Philip Stockton, Samuel McRoberts, Newcomb Carlton and James L. Richards. These men mostly represent the National City Bank, First National Bank, and other Wall Street banking interests. The Great Western, therefore, is affiliated with, though not controlled by, the American Sugar Refining Company. In September, 1922, a syndicate of Jewish bankers, Goldman, Sachs & Company and Lehman Brothers, sold a block of $1,300,000 preferred shares. In December a non-Jewish syndicate, consisting of Clark, Dodge & Company and Dominick & Dominick, offered for sale $6,800,000 additional shares of preferred stock.

The common stock issue is the same amount, $15,000,000. It paid a five per cent dividend for eleven years after consolidation, but in the meantime the surplus piled up so that five years ago a forty-two per cent stock dividend was declared. This stock has paid seven per cent since 1916, with occasional 10 per cent extra dividends. It is understood to have sustained a heavy loss by its carry-over of a large stock of sugar manufactured in 1920 from high-priced beets which it had to dispose of on a lowered market.

The company is so secretive about its operations that the publisher of the Moody manual appended a note to his listing of this company to the effect that it had declined to give sufficient information that would enable him to give the facts in standardized form.

Made Divorce Fashionable in the United States

Proclaiming "Dictatorship of Women," Mrs. O. H. P. Belmont Claims Her Courage Freed Woman From "Marriage Slavery"

By JAMES MARTIN MILLER

MRS. OLIVER H. P. BELMONT, President of the National Woman's Party. (C) Harris & Ewing

THE National Woman's Party, with Mrs. Alva Smith (Mrs. O. H. P) Belmont, and Miss Alice Paul as mistresses of ceremonies, entertained me a few days ago. It was a case where one mere man had to take the terrific chastisement and punishment of 20,000,000 other men who collectively constitute the male sex which Mrs. Belmont describes as, "the most menacing and destructive influence the world has ever known."

As Mrs. Belmont dealt blow upon blow, in the most powerful and vehement words at her command, upon these 20,000,000 worthless and miserable and tyrannical creatures we call men, each blow aimed directly at me, I felt that I had become one of the first martyrs in a new persecution.

Mrs. Belmont sat on one side of me and Miss Paul on the other so I was completely surrounded. As Mrs. Belmont delivered her severe verbal punishment of men there was no chance to escape. I knew I was surrounded by veteran and trained warriors. Miss Paul did not look one bit sympathetic but laughed heartily as brave Mrs. Belmont trained her batteries upon the one representative of pestiferous man.

The scene of this one-sided battle was at *"the new Capitol of the United States"* in Washington, across the square from what is now called the Capitol Building where Congress is permitted to meet until the rival women's House of Representatives and Senate are organized to meet in this historic building. The present Congress and Senate of the male sex, it is promised, will be permitted to meet and deliberate until the Congress of women can take over the reins of government entirely, dissolving Congress as we now know it and sending all men back to private life, while the women of the National Woman's Party will straighten out the mess these men have made of affairs.

It has been announced that the first session of this United States Congress of women will meet next year and "legislate" upon the same bills that are under the consideration of the "Man's Congress" and prove to the nation and to the world that the National Woman's Party can do it better than the men.

When I arrived at the headquarters of the National Woman's Party, Miss Alice Paul received me. I asked to have the pleasure of meeting Mrs. Belmont

"I can answer all questions and represent Mrs. Belmont," said she.

"But, Miss Paul," said I, "when I go to Rome I want to see the Pope himself and not by proxy; in this case I want to see Mrs. Belmont."

She soon went to Mrs. Belmont who came belligerently into the room, fixed me with a cold eye, snapped out a question with military abruptness, and the battle began.

I thought it best to take the offensive.

"Mrs. Belmont, is there any reason a woman should not be President, Vice-President, Secretary of State, War or Navy, Senator, Ambassador, Minister, Consul General, Governor, officers in the Army and Navy?"

She answered in a tone of high disgust: "Of course not; no reason whatever why a woman should not hold any office. If you were an intelligent man you would not ask such a foolish question."

"Mrs. Belmont, inasmuch as the wife of the President is now 'the first lady of the land' in the event that a woman should become President then her husband would be known as 'the first gentleman of the land,' would he not? And the husband of the ambassador to the Court of St. James would be known as the husband of the ambassador?"

"Certainly, and why not?" roared Mrs. Belmont in a voice that shook my courage.

"But, Mrs. Belmont, we have overlooked one thing here; say a maiden lady should become President?"

"Why she'd have a million proposals to marry the day she was nominated; you men are always looking for soft snaps," was her reply.

What Woman's Party Would Do

THEN the militant president of the National Woman's Party launched into an outline of the principles of the Woman's Party as follows:

"Henceforth women are to be dictators. The end of the dictatorship of the world by men is in sight. We women have lived long enough in the cramped confines of a misfit social structure. We have been forced to sit still too long. We have been powerless for such an endless time that we have enough stored-up energy to shape any structure to our will.

"We know we can manage the house. We can and will reconstruct it. We can put on a left wing and a right wing. *We can even tear the house down if we like and I think men know that perfectly well.*

"The time has come to take this world muddle that men have created and turn it into an orderly, peaceful, happy abiding-place for humanity. In its present condition the world is its own worst indictment against the dictatorship of men. Men have always obstructed and suppressed the intellect of one-half of the human race. They have always worked for themselves. That is not sufficient. The error lies here.

"Men have always kept women in subjection. To acknowledge women as equals would have destroyed their own pedestals. *But now we propose to destroy these pedestals of egotistical man.* They have opposed an even partially woman-governed world, fearing a limitation of their own undisputed freedom.

"Men have insisted not only that we live in a man-governed world but that we worship in a man-dominated church; we no longer accept this. When we speak of women as dictators we mean that we are establishing such dictatorship for the good of the human race.

"The day is not far off when the Woman's Party, of which I am president, will be strong enough to impose any measure it may choose. We mean to plant the idea of independence in the mind of every woman. Our Party will be a woman's Party, and only a woman's Party. It will have no members, no officers, no employes who are not women.

"I have no intention of repeating the experience of the American Red Cross, which, in spite of the fact that it was founded by a woman, is run entirely by men. Every big, high-salaried position in the organization is now filled by some man. It will never be possible for that to happen in the Woman's Party.

"Be Independent," Her Cry

"THERE is a clause in the deed of gift of the property in Washington—the building on which the new Congressional Building for Women will be erected—which provides that it reverts to my estate the moment any man is given official position, employment or salary. We will never get a balance of power except through rigid rules like these. The world makes its adjustments by swinging to extremes.

"We mean to free women from the indignity of hanging on to the old political parties. Women have got to stop being political followers.

"Perhaps there is something very glorious about being a helpmate, but if so it's time some man shared that glory. And there is something very glorious about being a starter, an initiator, a leader; it's time women shared that, too.

"The strength of man has always been in the union of men, and the weakness of woman in her lack of union. It is necessary to make women realize that until they have achieved some solidarity they will never be able to impose their will upon the state.

"Men have always tried to isolate women, to keep them as creatures apart. Men have always put women in houses, shut them away behind walls, kept them for themselves, detained them apart from the community. Men used to put women in a harem; now they put them in the same thing but call it a home.

"Women in the past have been afraid to lose the respect or the admiration or the love of men by opposing their wishes. In the last few years the suffragists have demonstrated that women do not lose the admiration of the worth-while men by expressing their individualities. Women gain far more than they lose by an attitude of independence."

"Mrs. Belmont," I ventured to interrupt, "do you believe in laws that make divorce easy?"

"I was the first woman in America to dare to get a divorce from an influential man. Up to that time divorce had been the prerogative solely of actresses. Rich men could marry women, treat them in any way they chose, and ignore them. No woman dared to get a divorce. But I did. I made divorce possible for American women. I have gone down the aisle of the church when women I had known since childhood drew back in their pews and refused to speak to me. I have been the guest at parties where the hostess was the only woman in the room who talked to me. Why? Because I had dared to criticise openly an influential man's behavior. That is all changed. There is hardly an influential family whose women have not deemed it wise to divorce their husbands.

"Divorce was the cause of my first ostracism, then suffrage. When divorce became respectable I was received back into the fold.

"When suffrage divided itself into militant and non-militant groups, I, as a militant, was again in disfavor.

"Men must cease to dictate everywhere; in the judiciary, in the Senate, and even in the White House. If the right woman came forward I would say, 'Make her President.' I am sure we have in this country more women fit to fill the Presidency of the United States than the last few men who have filled it. Today you say to an intelligent American: 'Why don't you go into politics?' He replies that it is so corrupt and vile he wouldn't think of it. Who made it corrupt? Who is going to rescue it from its corruption? If men do not choose to do it surely they have no right to bar us from doing it. Men have demanded and held control everywhere. If they had controlled things in the right way we might have had no complaint. They have not done so, and we women are full of indignation and resentment," said Mrs. Belmont.

"Do you believe in birth control, Mrs. Belmont?"

"It's no one's business but that of the woman who bears children as to whether she has them or not," she vehemently replied.

"Do you think, Mrs. Belmont, that it is becoming for women to smoke cigarets?"

"Just as becoming and proper for a woman to smoke them as for a man to do so, and that is strictly her business," was her rejoinder in no gentle tones.

"Do you believe the prohibition law is going to make people better?"

"I do not believe in the prohibition law and do not think such questions are proper ones for legislation."

She Would Be Candidate

IT IS said that Mrs. Belmont entertains ambitions to become the first woman candidate for the Presidency. I said to a member of the Woman's National Party: "In the event that Mrs. Belmont should become a candidate on such a ticket would men be welcome to vote for her?"

"Oh, yes, of course they could vote for her but no man would have any voice in the management of the Woman's Party; neither would any man be appointed to office in case Mrs. Belmont were elected President. The Cabinet, the diplomatic offices, the Federal judges, and every office would be filled by women and only women," said this militant one who asked that her name be not mentioned. She admitted that the Secretary of War as well as Secretary of the Navy would be women.

The League of Women Voters, however, has entirely different ideas from those of the National Woman's Party. The former co-operate and work with men in both the political parties; they do not believe in a separate woman's party. Both of these woman's organizations have branches in every state, and are active. While both seem to be well financed, Mrs. Belmont is a multimillionaire. Both the men she married possessed tens and perhaps hundreds of millions, and Mrs. Belmont was the beneficiary of each of those former husbands. She is able to finance a campaign for any amount without any outside aid. She has spent hundreds of thousands in the woman suffrage cause.

Mr. Kahn Is Too Modest

MR. OTTO KAHN, of the banking firm of Kuhn, Loeb & Company, is reported to have said in a speech to the Rochester Chamber of Commerce that he doesn't know what an international banker is. It appears to be a case of Mr. Kahn being too near the thing to see it. For his benefit a brief list of some of the characteristics of an International Banker is appended.

An international banker is a member of the International Race, which has no country and plies its own purposes in all.

An international banker is one who (taking an example known to Mr. Kahn personally) was born in Germany, took citizenship in Great Britain and now calls himself a citizen of the United States for whose people he frequently assumes to speak in Paris.

An international banker is one whose firm has connections, even in war times, with alien nations and enemy nations, and who plays the financial game through neutral countries for or against each or all the warring nations as may comport with his notions of profits.

An international banker is one who belongs to such a ramification of financial institutions that at a World's Peace Conference, say at Versailles, his connections are represented on both sides not only by partners but it may be by relations.

An international banker is one to whom the enemies of all nations, the Bolshevists, send their stolen gold by millions of dollars for investment in a safe country like the United States.

An international banker is one who, ostensibly supporting one President, is really grooming another Presidential candidate for favors which may consist of ambassadorial appointments which have hitherto been sought unsuccessfully.

And, finally, an international banker is one who in the face of the thunderous facts will stand up calmly and in dulcet tones deny that there is any such a thing on earth.

In view of the fact that an agency saw fit to telegraph Mr. Kahn's unimportant utterance from coast to coast for publication in newspapers which are largely supported by the advertising of corporations which in turn are financed by international bankers, this preliminary description is given, and it will be followed from time to time, for Mr. Kahn's benefit, if his present modesty shows no indications of abatement, by descriptions still more definite.

One Decision to Be Praised

IN DECIDING an appeal by the government in a Federal taxation case, the United States Supreme Court has established a principle of law which has a wide effect. It should settle for all time efforts to evade the payment of taxes alleged to be excessive or illegal, and simplifies the procedure to correct mistakes.

A certain company sought by injunction to prevent execution against its property for unpaid Federal taxes amounting to $1,000,000 or more. The injunction was granted in district court and the government took an appeal.

The Supreme Court reversed the decision of the lower court on the ground that the proper procedure to correct erroneous taxation is for the aggrieved party to pay under protest and then sue to recover any excess due.

The effect of this decision is apparent. The plan of the company to force the government to initiate suit for settlement of the difference between the tax as levied and any justly due would have opened the way for limitless litigation, and the satisfaction of delinquent taxes by property seizure and sale would have become practically impossible.

The government is the people and its rights are the people's rights. The individual citizen must often submit to what he deems unjust action, but has always a protection in the courts against injustice. The attempt to secure redress by preventing the execution of law is not to be thought of.

Besides, the aggrieved taxpayer himself stands a much better chance of justice by appearing in court as a suitor against unfair assessment, as plaintiff, than as if brought in as defendant, and would-be tax-dodger, seeking to evade or compromise for money he owes the common treasury of the people.

By paying under protest, as many have done, no rights or equities are surrendered.

How Can It Be Done?

THIS letter, written by a man of international fame who cannot be named here, shows that some thought is being expended on a subject which has been opened in this paper:

> "In the matter of control of credit, it seems to me like every other modern question, a political matter. Each nation needs a strong executive: an executive stronger than any individual or corporation within it. To talk of international finance being independent of national governments is nonsense. With strong national governments the individuals, who have to live under *some* government and who compose international finance, could be brought to heel."

There is in that brief paragraph a world of wisdom and a suggestion for action. It is worth thinking about.

The New Premier

THE selection of Stanley Baldwin to head the British Government has been received everywhere with a sense of increased stability. Bonar Law was a much bigger man than Lloyd George, but the job of reconstruction was apparently too much for him, not only as a physical task but also as a political one. Stanley Baldwin has been tested on some pretty tough propositions and has usually arrived at a point of accomplishment. In stature he promises to exceed any British premier of recent years, and his selection reduces Lloyd George's political stature even more than Bonar Law did. In leadership insufficient, in opposition futile, the former Welsh premier has quickly sunk to his proper place among the second-rate politicians of the old era.

Fears System, Not Human Nature

THERE is food for reflection in the summing up of his survey of the economic situation in Europe, and it applies here as well, by H. G. Moulton, of the Institute of Economics of the American Economic Association, as published in the organ of the association in its March issue. Mr. Moulton says:

"The notion that somewhere down underneath the surface of things the people are at work like beavers in reconstructing the foundations of the economic edifice and that good old human nature may be relied upon to achieve the economic salvation of Europe, regardless of financial ills or of the policies of politicians, is based on assumptions that were applicable in the age of Crusoe and even under the primitive rural conditions obtaining only a few generations ago in the United States; but they have little pertinence in the interdependent economic organization of today. The individual business man, with his land, labor and capital goods, is today in the fell clutch of economic circumstances over which as an individual he has practically no control. The individual is no longer the master of his own economic destiny. I am not distressed, you will observe, over the nature of man; it is the nature of the economic system with which we have to deal."

No man has the right to evade the call to duty the economic situation brings. If his personal comfort is assured beyond the need of physical or mental exertion as a wage earner, he has yet a duty to exercise his talents and influence for the common good.

And he will find ample reward in an honest effort to fulfill that duty.

Gold!

ON ANOTHER page in this issue we print portions of a speech by Captain Estes relating to the presence of Soviet gold in this country. The facts, however, do not rest on any man's say-so. The facts are in possession of the Government but we have reached such a stage of un-American cowardice in this country that there appears to be no one in Washington who will publicly sponsor a fact which would be offensive to the International Jewish Financiers.

There is now—the statement is made deliberately—not less than Two Hundred Millions of Soviet gold in Wall Street being insinuated by Jewish banking houses into various American investments for the purpose of producing rich incomes for the murderers of modern Russia. Some of the money, a negligible quantity compared with the whole, is being used to foster Bolshevik tendencies in the United States, but the leaders of Bolshevism are no doubt convinced by this time that there is something in the Anglo-Celtic-Norman-Saxon mind that neutralizes the Bolshevik germ. Bolshevism is the destroyer of the lesser races, not of the great race which has founded civilization. There is no question whatever that where industrial unrest is found or great and economically destructive strikes are fomented Soviet gold is easily traced. But the supremely horrible thing is that the financial system of the United States should be used to receive this gold virus from abroad and to pump it into the veins of American business life.

The proof is now all in hand that the Great War was foreseen and assisted by financiers of a certain class who prepared for it, profited by it and are not through even yet collecting their usury from the distress of the nations. The class that caused the war is the class that caused all wars, and the truth will take from them forever their power to do further harm. But what we need first and immediately is more patriotism and less Jewish financial pressure in the City of Washington.

Many attempts are made to misrepresent the position of THE DEARBORN INDEPENDENT on the question of gold in general and the question of alien gold in particular. As to a gold basis for our currency, by all means let us have it if it is a *basis*. But if it is only a basis for those who are in the money business and not also a basis for the dollar in the workingman's pocket, then it is not a basis. Moreover, if we claim that gold is our basis, and then discover that the basis is the privately owned property of an alien money trust who can use it as it will, then gold is not *our* basis at all but *their* basis legalized by us, the people taking all the risk and the alien money trust taking all the security. If gold is to be the basis of our financial system, then let the people of the United States own and control the gold—which they do not now. To have gold as the national anchor, and to have that anchor under the absolute control of private parties is not good for the Ship of State.

But, with all this alien gold in the country, people will say, "Look at our gold stock—the greatest in the world!" Yes, and it is not *ours!* There's the rub. It is a debt rather than an asset. German gold is in the United States by the hundreds of millions; British gold is in the United States probably to the amount of more than a billion; Soviet gold is here to the extent of not less than $200,000,000—the United States Government would probably put the figure at $250,000,000. If that is our foundation it is plain to the most inexperienced mind that these owners of our "basis" have only to pull the "basis" out from under us to throw us into the most disastrous panic in our history. Probably they will not do so now; the dividends paid on this gold from the fruits of American labor are now too valuable. But if another world crisis should develop, causing these alien investors to withdraw their gold as France withdrew her money from Germany just previous to the war, the results to the United States would be disastrous.

The question is, Are the people entitled to know these things? And is the anxiety of the people for their own security to be sufficiently honored by our financiers who have no more right to juggle with American finance than they have to juggle with the American Navy. The great mistake, of course, was ever to let the control of money go out of the hands into which the Constitution placed that control. Maybe we shall have to start a march back to the Constitution, and put our national Finance where the Army and Navy are, and where the Constitution put all three, under the control of Congress as representatives of the American people.

Mr. Ford's Page

POLITICS is in the air and all the prophets are getting busy earlier than they ever did before, but it is significant that there is nothing new about the politics, that is, it is the same old talk about parties and candidates, it is the same old contest for place, without the slightest discussion as to how this party or the other, one candidate or the other, will serve the people.

The politics about which we hear so much today is all within the old ring of politics, there is not a word, not a discussion as to what any of them propose to do for the United States. There are not even any party issues. The nearest thing to an issue which either of the great parties has seen is the "wet" and "dry" issue, and if politicians were even half wise they would know by this time that "wet" is no longer an issue.

So that all this early excitement may be taken as a piece of strategy to put politics back on the map. As everyone knows, nothing has gone out of fashion so quickly and so hopelessly of latter years, as has politics. It is like an old model which nothing can revive. The people have consistently refused to take it seriously. The polling places of the nation have been more than fifty per cent deserted. As between tweedledee and tweedledum the people haven't cared the scratch of a voting pencil. Politics has simply slumped.

And it is apparently hoped by this early excitation of interest to rouse the gambling spirit of the nation again, to revive the old competitive spirit, and by a large field of candidates and near-candidates work the people into a good election frame of mind. That is to say, there is a good deal of wire-pulling going on behind the scenes to make the audience give an encore to politics.

There are those of us who remember that when candidates and parties came before the people, they came on issues. They said they would do this or that and the people were interested enough to discuss whether this thing which the Republicans wanted to do was wiser or better than the other thing which the Democrats wanted to do. Parties and candidates proposed something definite. There was a time when the Republican party promised to fill the dinner pails of the country, and there was a time when the Democratic party promised to furnish the country with a just financial system; but what is either of these parties promising today? We have fallen on a time when "economies in administration" is about the biggest thing that is promised, or a policy of "sitting tight."

The point is this: There are many things waiting to be done in this country, and we have reached a stage in our history when they must be done on a big scale, requiring if not government action then government vision and leadership. Up to this time the country has been developed by private initiative with magnificent results, except that there has been little unity in the development and the private motives involved have not always left room for the broader public purpose to be considered. But so great has become even private effort that it is being forced into a semblance of unity, and business itself, no matter how selfishly conceived, is beginning to feel the necessity for an organization of the resources and activities of the United States as a United States and not merely as a large number of corporations.

It is admitted that organizing minds are few at any time and seldom in modern times have they been present in governments. That may be the reason that up to the present we see no evidence that politicians are able to leave the business of politics and begin to show some interest in the business of the people of the United States.

INSTEAD of elections after the old style we should have some kind of a competitive bidding in the service of the nation. Let the Republican party say what it is prepared to DO and give bonds for its performance of its contract; let the Democratic party do the same; let all parties specify the things they will actually undertake to DO, and the result will be better than a lot of oratory and flag-waving. It would compel politicians to study the needs of the United States and that seems to be the particular subject on which most politicians are most ignorant. Elections are for terms of service and the service should be described with specifications as to how it shall be delivered. We should then be voting for a program instead of for mere office-seekers.

Are there no problems exclusively American to be solved? Is there nothing waiting to be done to enlarge the lives of our people? Is the material side of our country's life so well arranged that all we need to think about now is setting up certain political institutions in Europe? Does anyone care a cent about this politician's mind or that one's mind about a League of Nations when one knows that those politicians are talking about political leagues in order to conceal their ignorance of American needs? If a politician arose who could talk in terms of developing water power, for example, or of stabilizing the market for farm products, or of so organizing our business that we should speedily be done with the fluctuations of prosperity—at once so artificial, unnecessary and disastrous—that we have always witnessed here, would not the people think of him as knowing his business better than the man who conceals his economic ignorance and helplessness behind verbose discussions of foreign problems.

The man who will be of most use to Europe in helping to solve her problems is the man who can demonstrate his ability by helping the United States solve its problems.

Politics is no longer the business of this country. In days when the principal roads to distinction were the profession of law or the profession of speech-making, when the country "was on a talk basis," so to speak, and when the principal necessity was that certain ideas of liberty and union should be planted in the popular mind, politics was then a going profession, it meant something; it fitted into that stage of the country's life. But to try to keep the country on a "talk basis" when it has already shifted to an industrial basis, and to try to conceal one's ignorance of the country's needs by taking excursions into the dubious realms of international politics, is simply to try to prevent the past slipping away—and that cannot be done.

If there is anyone in the region of politics who realizes the terrible tax which our transportation methods put upon all our citizens (adding 100 per cent to the lumber that builds the workingman's house) and can tell how those methods are to be changed with government encouragement and assistance, and this heavy tax removed from the people—if there is any prospective candidate who can take up the various wholesale robberies being practiced upon all sorts and conditions of people by interests who have never learned the meaning of the term "service"—if there is among the whole retinue of politicians one who has lived close enough to the people's problems to have really felt them and really thought about them, then there may be hope.

But when you run your finger down the government lists and see bond brokers, speculators, lawyers, hired propagandists, professional officeholders, talkers, fixers, party organization men comprising the actual government, and when you scrutinize the list of those who want to oust the government and see that the political aspirants on the other side comprise the same class of men—men who have never raised a loaf of bread nor driven a nail nor faced the conditions which the producing classes in this country are facing every day—then you begin to understand that politics has gone to seed, it has ceased to be Public Service because it has lost its contact with Public Need.

The country refuses to be interested in anything less than a program that actually promises to do some things that are crying to be done at home, and in anything less than men who have the ability to put the program through. Such men will have opposition enough, but they will have the American people behind them.

A volume of 346 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Weird Art of Great Benin Savagery a Mystery

Declared to Have Furnished Inspiration for Much of Present-day Freakishness

AN ALTAR that was drenched with the blood of human sacrifices until 26 years ago has been set up in the University Museum at Philadelphia. It is the central feature of a collection of idols and objects of art from Great Benin, capital of the country of the same name in West Africa which is now a part of the British Protectorate of Nigeria. Apart from its being an example of absolute barbarism, the altar and the objects associated with it have a direct modern interest in that they are said by many authorities to have furnished the inspiration for the waves of freakishness in art sweeping through civilized countries during the last ten or fifteen years.

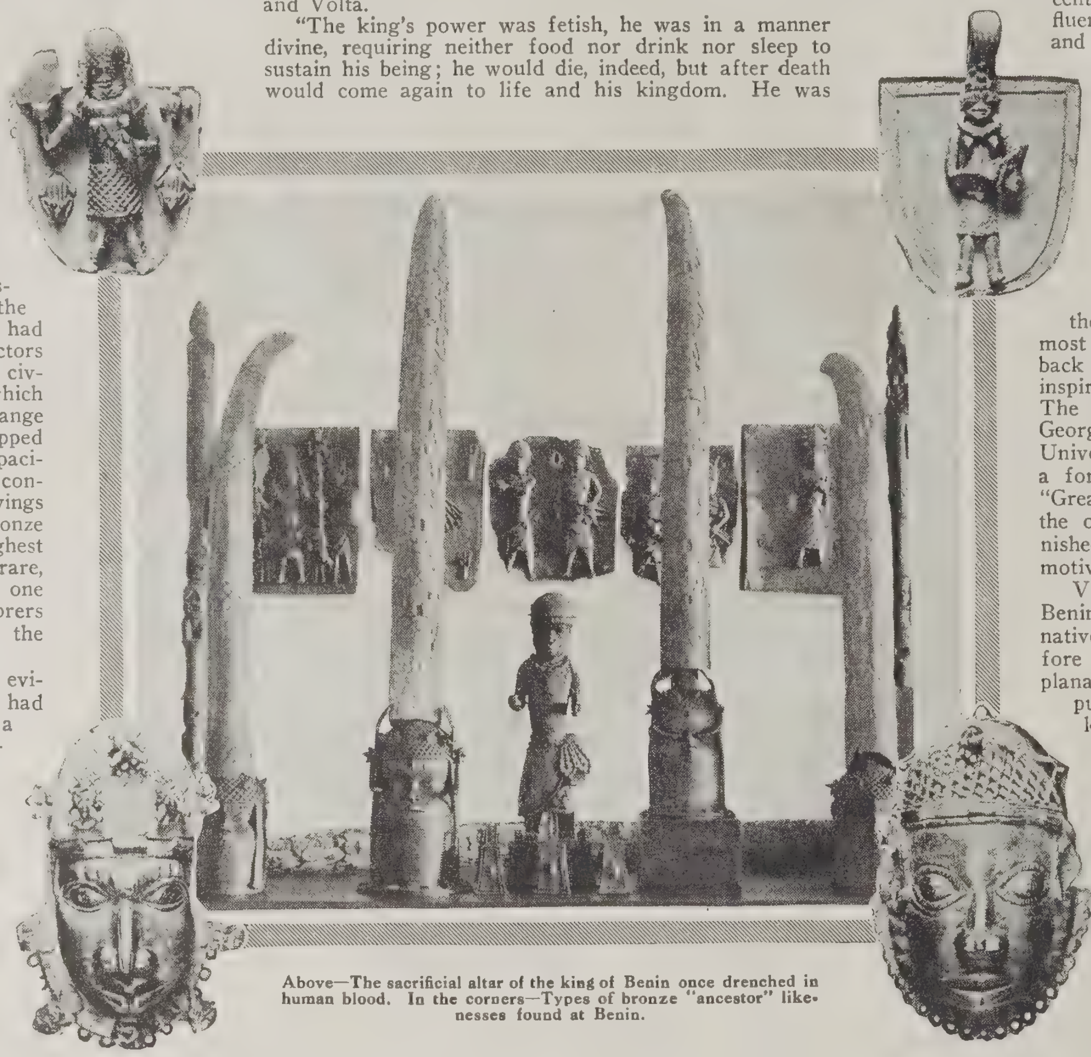
Great Benin for many years was a mystery to archeologists. Until the last king was made prisoner by the British in 1897 and the human sacrifices were stopped, it had been a source of supply to collectors of art objects representing early civilizations for the excellence of which none could account. From the strange savage city in the wilderness, equipped with palaces far beyond the capacities of present inhabitants in conception and execution, came carvings in wood and various works in bronze comparable to those of the highest cultures. The examples were rare, of course. It was not often that one could be smuggled out, and explorers were discouraged from visiting the city.

In time, however, it became evident that at Great Benin there had taken place, apparently within a few centuries, a rise from savagery to civilization and a fall back again such as had not been witnessed elsewhere except in terms of a thousand years or more. The city assumed a new significance in the minds of students of the human race. It became a sort of cross section of humanity. Development was traceable from the crudest beginnings to a point where Benin was an art center in the midst of the jungle. There was a short period during which marvelous work was done. Then the decline set in. It was as rapid as the ascent. The art work of Benin at the time of the overthrow of the kingdom was only a savage memory of earlier days.

By that time the city had become a religious center for the fetish worship to which uncounted victims were sacrificed. The power to order such sacrifices was not limited to the king. It was held also by the queen mother, the captain of war, the principal judge and the chief priest, each of whom might sacrifice human beings to his ancestors, from whom the offices named were inherited. The slaughter was performed by a public executioner who became an official of considerable importance. Victims were forced to kneel before the mud altar, on which were set up the fetishes, carved tusks, heads of brass or bronze, made in the likenesses of the ancestors being worshiped, bells and rattle staves. The rattles and bells were used to attract the attention of the spirits.

"The king of Benin," says H. U. Hall, describing the altar and the collection of which it is a part, "passed his life in almost complete seclusion from the lower ranks, at any rate, of his subjects, by whom he was only rarely seen. He exercised his authority through powerful officials and left the compound in which his palace was situated only on certain ceremonial occasions. Through his lieutenants he ruled over territory which at one time reached the sea on the Slave Coast, the flat, low stretch of the West African seaboard between the rivers Niger and Volta.

"The king's power was fetish, he was in a manner divine, requiring neither food nor drink nor sleep to sustain his being; he would die, indeed, but after death would come again to life and his kingdom. He was the object of a service which was of the nature of worship, and the sanctions of which were grounded in fear—the fear of a being whose seclusion surrounded him with mystery, and the arm of whose law wielded a terrible sword. Offenders against that law, together with slaves and prisoners of war, furnished most of the victims sacrificed to the gods.



Above—The sacrificial altar of the king of Benin once drenched in human blood. In the corners—Types of bronze "ancestor" likenesses found at Benin.

"The most striking and the essential part of the ritual of the worship of the Bini consisted in sacrifices to the ancestors, who were conceived as directing for good or evil the affairs of living men. These spirits might be angry, and the wider powers which death had conferred on them by association with the spiritual and the invisible, that is, with other spiritual forces and elements never incarnated and always malignant, made their anger most formidable. They must be propitiated, and blood, the essence of life, was an acceptable offering, if not a necessary revivifier, to them. Altars and images, containers of the ancestor spirit, the god, were drenched therefore with the blood of victims, fowls and goats and oxen and men and women.

"The gods were spirits; other spirits, liberated by bodily death, must be made messengers to them of prayers and wishes, and a human spirit was naturally the most efficient messenger. The gods were subject to the same needs as their children on earth; so, when a king or a great chief died, attendants must be dispatched with him to the spirit world, and others must follow on at each anniversary celebration of his death. For lesser men a lesser sacrifice of fowls or goats or oxen must serve; though the poultry yard and the herd were not spared in the former case either.

"Benin was, it seems, a holy city—it was cut off not only physically by a wall but spiritually by a kind of taboo from the rest of the kingdom—governed by a hierarchy whose members were possessed of varying degrees of supernatural power. Apparently the city maintained its supremacy over the other towns of the kingdom chiefly by the superstitious awe which this theory of government inspired, supported as it was by the bloody terror of ritual murder."

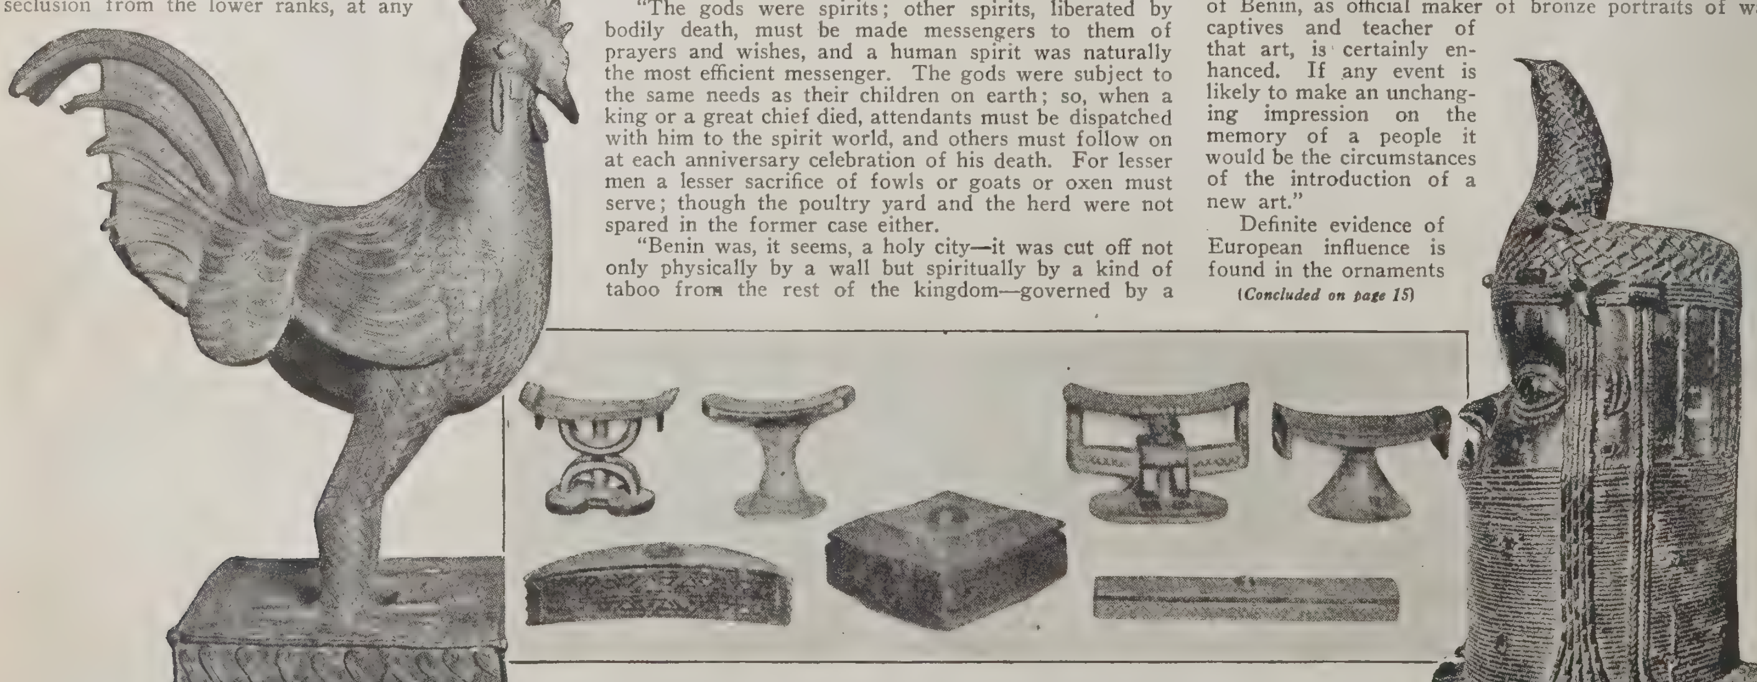
It has been stated that freak art developments of recent years have been traced to the influence of Benin carvings, statuary and bronze work, and to other examples of native African art that never reached the standards of Benin. Various authorities have pointed out resemblances between the native work and such modern growths as futurist, cubist and post-impressionist art. If that seems strange at first, it grows less so when considered in the light of the history of art. Most experts are agreed that when the highest developments and the most conventional forms are traced back far enough it is found that their inspiration came from savage sources. The point is well illustrated by Dr. George Byron Gordon, director of the University Museum, when he states in a foreword to Mr. Hall's study that "Great Benin was the last example of the old-style barbarism that has furnished history with one of its principal motives from the beginning."

Very early and later works from Benin are generally on a par with other native African productions and therefore need no special ethnological explanation. Various theories have been put forth to account for the excellent work done in what has been called the middle period. Efforts have been made to trace it to Egyptian influence. In that connection wooden headrests found in various parts of Africa are similar to those of ancient Egypt. Such headrests were the forerunners of the modern pillow. Pigment boxes also have been found in the Dark Continent, of a type familiar to all ancient civilizations. The pigment box is still in use under the name of the vanity case. Mr. Hall is inclined to the belief that the influence under which Benin developed its art was a comparatively recent development.

"In the reign of Esige," he remarks, "the ninth successor of the founder of the dynasty which was overturned by the British occupation, there was attached to the court of Benin, or living in the town, a white man, Ahamangiwa by name, who, being skilled in bronze founding, was commissioned by the king to make portraits of the captives taken in an expedition against a neighboring tribe. Certain of the king's boys were assigned to Ahamangiwa to assist him and to learn this new art. The circumstantial relation by a court historian of Benin of facts which link up well with known events in the history of the close Portuguese relations with Benin is evidence at least of probability. When, for instance, we know from a letter written to Dom Miguel, of Portugal, in 1516, by one of his subjects then residing in Benin as a friend of the king that Portuguese missionaries accompanied a Bini force on a military expedition and remained with it a year, the likelihood of a Portuguese Ahamangiwa's connection with the court of Benin, as official maker of bronze portraits of war captives and teacher of that art, is certainly enhanced. If any event is likely to make an unchanging impression on the memory of a people it would be the circumstances of the introduction of a new art."

Definite evidence of European influence is found in the ornaments

(Concluded on page 15)



Left—An example of the fine bronze casting done in the days of Benin's glory. Center—Head rests and pigment boxes from Africa, similar to those of ancient Egypt—the boxes are the forerunners of present-day vanity cases. Right—A view of a bronze portrait of the king.

A Colonial Empire That Was: Fate of Germany's Possessions

More Than Five Times Area of Mother Country, All Are Now Ruled by Powers That Conquered Holdings During War

By WALTER M. WOLFF

German native colonial troops on parade at Dar-es-Salam, German East Africa.

OBSCURED and almost forgotten since the war is the record of Germany's lost colonial dominions. To the world at large it was no secret a few years ago that Germany's commercial aspirations carried her to every corner of the earth. Even the schoolboy knew from his geography that Germany had large possessions in Africa, in Asia, and in the South Seas; and nobody questioned Germany's right to colonies any more than he did England's or France's or Holland's, or perchance that of his own or any other country. Germany owned colonies and was developing them as she saw fit; the world thought no more about them and cared less. But all this happened prior to Versailles.

Today the world has practically forgotten and Germany has no colonies. When it is remembered that in 1914 her largest colony, German East Africa, was half again as large as the entire *Reich* itself, our curiosity might be aroused relative to the actual importance of the German colonial holdings which, as such, are no more, but should not be entirely forgotten. What were the German colonies? How many were there? Of what value were they to Germany and how were they lost during the war? These and similar questions are of sufficient interest to call us away from the topics of the day and to brush up our memories somewhat on a little-known phase of bygone history.

The imperial governor's home in former German New Guinea.

Nearly every newspaper reader today knows that Germany was forced to give up control of Alsace-Lorraine to France; that she lost the Saar coal fields; that most of Upper Silesia has been given to Poland; and that German territory has been carved and chiseled away within the last five years to such an extent as to leave not much more than the core of what was once a very healthy apple. But that an "invisible empire" of more than 1,027,000 square miles (which is about five times the size of Germany proper) was once the pride of the Fatherland, which was lost almost in a day, is an item not apt easily to be recalled by a busy, restless, more or less disinterested world.

To begin with, we must not overlook the fact that the Germany of better days usually had her fingers in the pie of world affairs at all opportune moments, much like any other major nation. And experience has taught the world that this statement is all too true to need further comment. It is enough for us to know that Germany kept a colonial eye steadily focused on Africa, the Orient and on the Pacific, beginning with 1884. At this important juncture in Germany's history, the venerable Bismarck came upon the scene and the rapid expansion of Germany as a world power began. Bismarck knew that if Germany was to figure prominently in world affairs of the future, in competition with the other great powers, she must acquire colonies and become a colonizer like the other great powers. It, therefore, became the new policy of Germany to enter the field of colonial expansion. Whether the newly acquired colonies should in themselves become paying investments (which they were not) seemed to be a matter of ulterior importance. The main plan was that they should be directly instrumental in paving the way for commercial prestige and world-wide trade extension. In other words, when Germany saw that to have colonies (like children) was fashionable, Germany set out to get colonies; and the results of her getting from this time on were in many respects quite remarkable. She finally came into possession of territory over a million square miles in size, with a total population of fifteen millions.

Her colonial property in Africa was comprised of Togoland, Kamerun, German Southwest Africa and German East Africa. In Asia she secured control of Kiachau Bay from China. In the Pacific she acquired, chiefly through purchase: Kaiser Wilhelm's Land or Eastern New Guinea and islands; and German Oceania which was a little island empire composed of the Bismarck Archipelago, the Marshall Islands, thirty-two of the eighty-eight Caroline Islands, two of the fifty-six Pelew Islands, part of the Solomon Islands, and seven of the fifty-eight Mariannes. Germany also owned the two largest islands of the Samoan or Navigator Archipelago.

Most of the colonies and dependencies became protectorates under an imperial governor, while the actual development was left in charge of German colonizing and trading companies. That Germany found her colonies not at all a paying proposition, although large and rich in raw products, is shown by the trade balance of 1905. In this year the total value of the imports from the colonies amounted to only eighteen million marks, while the exports to the colonies came to forty-six and one-half million marks. An imperial contribution was thus always necessary, and the rebellious natives kept the German government at home very busy meeting enormous expense accounts which, of course, had to be checked off as profit and loss.

Much Money Poured Into Vast Stretches, But Only Togoland Proved Self-supporting

The largest colony belonging to Germany, German East Africa, was about as large as Arizona, Nevada and California combined. Its extreme length was 725 miles and it had a seacoast 620 miles long. The country produced almost every tropical fruit, cocoa, coffee, cinchona, fibers, sugar, tea, rubber, tobacco, vanilla and maize. Coal, copper, gold, iron, lead, mica, precious stones and salt have been found, also garnets in large quantity; and forests of mangrove, palm and tamarind abound on the coast, while acacias, cotton trees and sycamores cover the higher areas. Government forests extended over more than 200,000 acres; and the government also operated experiment stations for stock breeding and tropical culture. The natives in the more settled regions pursued agriculture, some of them cultivating large banana plantations, while near the coast were many German estates. Wide, well-kept roads, on some of which rest-houses and supplies were provided, traversed the entire country. Railway transportation was well developed, and many government steamers plied along the coast and on the great lakes, but few of the seaports were available for ocean ships. Telegraphs connected the towns on the coast with one another, with Ujiji (where connection was made with the line from Cape Town to Cairo) and with Zanzibar. Dar-es-Salaam, the capital, had more than 25,000 persons, but Tabora, two-thirds of the way from the ocean to the lakes, was the largest city, with a population of about 40.000. The country had 17 government schools with 3,500 pupils, and several hundred mission schools with 17,000 scholars.

Kamerun, north of French Congo, was a colony almost as large as Germany itself, but had a population only slightly greater than the city of Berlin—mostly Bantu and Sudanese Negroes. The country was very fertile but the great number of swamps made it very trying for Europeans of whom there were scarcely 1,000. The name of the dependency was derived from the river, which enters the Bay of Biafra by an estuary more than twenty miles wide, and for a considerable distance is nearly a mile wide. Northwest of the river's mouth lie the Kamerun Mountains, a volcanic group which in one peak, Mongoma Lobah, the Mount of the Gods, reached the height of 13,746 feet. The chief exports derived from Kamerun were rubber, ivory, horns, cocoa and oil fruits.

German Southwest Africa had an area of 322,450 square miles, with a population of some odd 200,000—largely Bantus and Damaras. This country had cable connections with Europe and two important railroad lines, one 237 miles long and the other 359 miles. Windhoek was the capital, with Swakopmund the other important city. There were extensive pastoral interests and artesian well irrigation; and cotton cultivation, to-

Chiropractors Go to Jail in Ohio to Win Professional Independence

State Medical Board Pushes Prosecution of Practitioners Who Declare They Are Not Bound by Physicians' Regulations

Next to religion, perhaps medicine is the most ticklish subject in the world with regard to possible controversies. So when the report came to THE DEARBORN INDEPENDENT that the law was being applied in Ohio to a class of men whose desire is to assist the people to regain or maintain their health, that class being fairly well established on a scientific basis, and that several hundreds of those men had endured fines and even imprisonment for a principle, we asked an entirely disinterested publicist to ascertain the facts and report. The article here presented is the result. It seems to outline a policy of perfect fairness to the profession and protection to the public.

By ALBERT SIDNEY GREGG

A SINGULAR struggle to win professional independence is raging in Ohio between the Ohio Chiropractic Association and the Ohio State Medical Board. Since December, 1922, *nearly 200 chiropractors have been arrested by agents of the medical board,* and arraigned before municipal judges and justices of the peace. While this article was being written, in May, 25 arrests were made in Toledo, and preparations were being completed to arrest chiropractors in other cities.

Many of these men have been convicted and fined $25 to $500. Some have refused to pay their fines, because, under the law, this money would go to the treasury of the medical board to be used for the further prosecution of chiropractors. Those who do not pay are sent to the county jail or workhouse, where they are working out their fines at sixty cents a day.

Officials of the medical board claim that they are merely enforcing laws enacted to protect the public from irresponsible and incompetent medical practitioners, who are a menace to life and health.

To Jail Rather Than Pay

CHIROPRACTORS of recognized standing freely admit the very condition charged by the medical board, but insist that the cleaning up should be done by chiropractors themselves, under the regulation of a state law. In place of merely trying to drive out the incompetents, so the chiropractic leaders claim, the medical board is seeking to destroy the chiropractic profession as a whole. They also assert that the medical board has exceeded its authority. In support of this contention the chiropractors call attention to the so-called Administration Code passed as an emergency measure when Harry L. Davis was governor. This law provides that the state medical board shall be attached to the Department of Education. It is distinctly specified in this code that it shall be the duty of the Department of Education to make recommendations as to preliminary education, standing of professional schools, and colleges, methods of conducting examinations, and how the laws shall be enforced. So far the Department of Education has not had any say in the matter. Disregarding the plain provisions of the Administrative Code entirely, so the chiropractors claim, the Ohio State Medical Board is prosecuting chiropractors under rules of its own board rather than according to recommendations of the Department of Education, as specifically provided for in Section 154-46.

All the prosecuting is done by inspectors who operate under the supervision of Dr. H. M. Platter, secretary of the medical board. No arrests, so it is asserted, have been made on complaint of citizens or county officials.

The arrests and prosecutions have stirred up considerable interest and some excitement, especially where young doctors have elected to go to jail rather than "contribute" to the treasury of the medical board. In Cincinnati two chiropractors who were sent to the workhouse made careful preparation for their stay in that institution. After they had been enrolled they were ordered to "take a bath." They told the attendant that they had just had a bath, and he replied:

"Can't help that. You will have to take another one." And they did. They were then given numbers like convicts and locked up in "bootleggers' row."

Sentiment Changes Sentence

AT CANTON the justice sent four chiropractors to the workhouse for more than two years. He gave them the limit—a fine of $500 to be worked in the usual way. Mass meetings were held, press and public got busy, and finally the judge had a change of heart and let the prisoners out voluntarily after they had served thirty-six days. The defendants resumed practice with a largely increased business.

In Youngstown eight men and one young woman were committed to the workhouse for six months, but they were in jail only 32 days. Public sentiment forced the judge to release them. Four other Youngstown chiropractors were convicted before the same judge and fined $100 each. They took an appeal and while the appeal was pending they were re-arrested by inspectors of the medical board.

Two young men were arrested and tried before a justice at Norwood near Cincinnati, but they were acquitted. Then they were re-arrested on a different count and taken before a justice in another township, who sent them to the county jail for six months. The men were imprisoned just eleven days. Public sentiment forced the trial judge to remit their fines and let them go.

Justice Mark H. Shank, of Kenmore, near Akron, Ohio, presided at the trial of twelve chiropractors who had been arrested on the charge of "practicing medicine and surgery without licenses, to-wit: advertising in the newspapers." After a brief hearing all the defendants were discharged. Justice Shank in dismissing the cases declared that the chiropractors were being persecuted by their medical competitors. In a public statement later published in the Akron *Beacon Journal,* Justice Shank said:

"The chiropractic method has or has not remedial properties. If it has not, its practice should be entirely abolished, and if it has, its practice should be permitted, protected and propagated. The present law should be revised so that it will provide for a board of chiropractors for the examination of members of the profession. It should not permit the continuance of the present farcical method of examination which reminds me of trying a canary bird before a jury of tomcats."

In discussing this question with Dr. David A. Williams, of Ashtabula, Ohio, field secretary of the Ohio Chiropractic Association, I asked him to define the issue in simple terms:

"The laws of Ohio governing the practice of medicine and surgery," he replied, "define the chiropractic system as a limited branch of medicine, subject to the control of the Ohio State Medical Board. We hold that it is not a branch of medicine and should be regulated by a separate board created by an act of the legislature, just as has been done in 25 other states. Such a bill was before the last legislature, but it was openly opposed by the state medical board, the head of the Ohio Public Health Association, and the secretary of the Ohio State Medical Association. This bill was not reported out by the public health committee. It was not given a chance on the floor."

Hold Rules Unreasonable

"PREVIOUS to 1915 there was no law in Ohio relative to chiropractic. The name, chiropractic, did not appear anywhere on the statutes. Several attempts had been made by the Ohio State Medical Board to construe chiropractic as the practice of medicine and a number of people have been prosecuted for practicing chiropractic on the ground that they were practicing medicine without a license. In about ninety-five per cent of the cases, however, the court ruled that chiropractic was not the practice of medicine and the defendants were acquitted.

"In 1915 a statute known as the Platt-Ellis law was passed. It was sponsored by the medical board. This law made chiropractic a limited branch of medicine and gave the medical board the power to make rules and regulations governing the practice of chiropractic. At that time about 180 chiropractors were examined by a chiropractic committee, appointed by the medical board, and received licenses as limited practitioners of medicine. Since that day there have not been over a half-dozen licenses issued to chiropractors in Ohio and yet it is estimated there are between 800 and 900 chiropractors, or those who hold themselves out to be such, practicing in the state.

"The rules adopted by the medical board under the Platt-Ellis law were so intolerant, unreasonable, arbitrary, unjust and unfair that qualified chiropractors, out of respect for their own integrity, their profession and its schools and colleges, could not and did not attempt, save in a few cases, to live up to these rules. A few prosecutions were attempted, but with little success. In spite of the fact that a state statute said that chiropractic was a limited branch of medicine, it was difficult to make any court believe it so. The scientific fact remains that chiropractic is not the practice of medicine, even in a limited form. Twelve state supreme courts have also decided that chiropractic *is not a practice of medicine.*

Say Law Has Joker

"IN 1919 a bill known as the Tally Act was sponsored by the state medical board and passed, which gave the medical board still more power, and made it easier for the board to prosecute supposed violators of the medical practice laws. It provides that whoever maintains an office to practice medicine in any of its limited branches, or who advertises or represents himself to be a practitioner of medicine in any form, without first securing a license from the medical board, shall be subject to arrest and fine.

"A clever provision in this law makes it practically impossible for the accused ever to obtain a jury trial. In case he is arrested for a second offense, he may have a jury, because the penalty then is a fine *or imprisonment.* But there are no *"second offenses."*

"Under the foregoing law a chiropractor may be arrested three or four times in succession, but each arrest will be on a different count, thus making it a *first offense.* For example, Brown may be haled before a justice for *hanging out a sign,* and fined $500. After he has paid his fine he may be taken into custody again for *giving out a card.* Again he pays his fine and is released. But that is not all. He is liable to arrest and a fine of $500 for *advertising in a newspaper.* By thus making each arrest a *first* offense, the effect is to prevent the defendant from having a jury trial, and to enrich the treasury of the medical board to the extent of the fines collected. *Does it not look as if the deliberate purpose of this method was to bankrupt the chiropractors by compelling them to pay repeated fines?*

No Protection Afforded

"AS SOON as this law became effective the state medical board began the prosecution of chiropractors. Twenty-one chiropractors in Cleveland were arrested at one time and hauled into municipal court. Then the chiropractors put on their fighting clothes. In May, 1919, they obtained an injunction against the medical board to prevent malicious prosecutions, and this injunction stopped all such activities until last December when the injunction was dissolved by the court of appeals in Cincinnati. Then the prosecutions were renewed, and have since been vigorously pushed. This case has been appealed to the state supreme court, and will probably be decided in a few months.

"Meanwhile what is happening? For seven years there has been no legal regulation of this profession in Ohio. No standards, educational, professional or ethical, have been or can be enforced relative to the practice of chiropractic as long as the matter is being questioned in the courts. Any individual desiring to do so, whether qualified or not, can practice chiropractic. Short-term and correspondence graduates locate in Ohio, open an office, and begin the practice of chiropractic at will. Incompetents and those who have failed to pass examinations in other states, that have good and adequate laws, take their place in the profession unmolested. Thus Ohio has become the dumping ground for professional incompetents, and the situation grows worse every year.

"This condition of affairs greatly endangers the rights of the people who want chiropractic service. The public does not, because it cannot, discriminate as to whether a chiropractor is qualified or not. There is no adequate legal safeguard to guide and protect the people in their right to receive chiropractic service.

"In addition to the foregoing, the standards of the profession in Ohio have no protection. The influx of incompetents from other states, and the coming of short-term and correspondence graduates, lowers the general educational, professional and ethical standing of the chiropractic profession in this state. If a chiropractic outcast comes to Ohio and is found guilty of some misdemeanor, the profession in general shares the disgrace. This is unjust, to say the least.

Sawyer Member of Board

IS IT not highly important that the legislature solve this problem? We believe it is. In so doing, the legislature will relieve the state medical board of a burden which never should have been placed upon it.

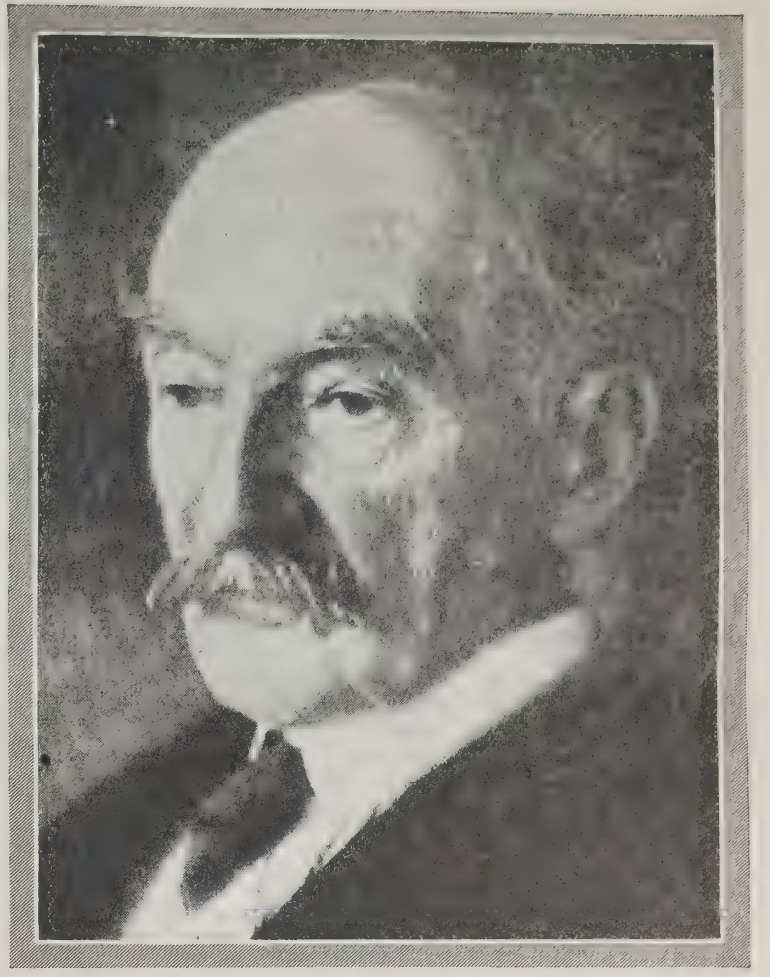
"We are making a special effort," continued Dr. Williams, "to obtain representation on the medical board. Under the law members of this board are appointed by the governor subject to the approval of the senate. The requirements are that schools of practice shall be given representation on the board as nearly as possible in proportion to their numerical strength in the state, and since chiropractors number nearly one thousand in Ohio, and since the law at present provides that chiropractics be governed by the rules and regulations made and adopted by the medical board, the chiropractors believe they should have some representation upon that board. *To be ruled by a board upon which you have no representation is tyranny."*

Dr. Sawyer, who is President Harding's physician, has served on the medical board for nearly seven years, and Governor Donahey will soon be required to appoint a member to take his place. Meanwhile Dr. Williams, representing the chiropractors, has laid the entire situation before the governor and has urged him to choose a chiropractor, or at least a man who is not antagonistic to chiropractors.

Thomas Hardy and His Wessex Country

Counterparts of His English Rural Characters Not Hard to Find

By JOHN DAVIS ANDERSON



THOMAS HARDY

> Had Thomas Hardy never lived and written, the home of his birth and its environment would still exercise an abiding spell upon all those who love rural England, and who, pre-eminently in the southern counties, find the attractions of summer and rural life perhaps more strongly emphasized than in even most of the many other favored portions of Britain.
>
> —George H. Ellwanger.

BUT Thomas Hardy has lived and he has written! The real fortunate part of the whole matter is that this most deft and skillful of all the modern novelists was born in this part of the world and has never been far removed from it. The background of it all forms the canvas upon which he has painted full length the life of Tess, of Marty South, of Giles Winterbourne, of Michael Henchard, of Jude Fawley, of Eustacia Vye, to mention but a few characters encountered in the long list of novels which came from his pen between the years 1871, when he wrote "Desperate Remedies," and 1895 when "Jude the Obscure" appeared.

It must not be supposed that Hardy was the first writer to find literary settings in this South-of-England group of counties. Indeed it was no new field when he took it in hand, nor must it be surmised that he has closely confined himself to only one county or to a restricted region. As a recounter of this Wessex Country we first have John Aubrey (1626-1697), a gossip, "whose odds and ends about men, things and places are now better than most full-dress literature," and of whom Anthony à Wood once prophesied that he would some day break his neck while running downstairs after a retreating guest in the hope of extracting a story. Then came Gilbert White (1720-1793), the writer on natural history who until the time of Darwin had more closely observed the habits of birds, insects and earthworms and more clearly recorded what he had observed than any other writer. The next to draw attention to this region was William Corbett (1763-1835). Between Farnham, Weyhill and Botley was the best of Corbett's England. What he declared he loved most were "the heaths, the miry coppices, the wildwood and the forest" of the region. We have William Hazlitt (1778-1830), the essayist, a small part of whose very early life was spent in America. Hazlitt makes much of the "far off in time and space" and much like a character in fiction. Richard Jeffries (1848-1887) was likewise of this region. He knew Wessex "from childish rambles, long walks as a sportsman, as naturalist and reporter, and loitering as a lover and philosopher, that it became a portion of himself, as if he had partly created it."

But none of these, delightfully as they have all written, possessed instincts of true novelists. For purpose of fiction Hardy found his field right at home; at his front door. He was born on June 2, 1840, in the little village of Upper Bockhampton a mile outside of Dorchester. Today he lives at Max Gate, but a short distance from the place where he was born. The Hardys of Dorsetshire are descendants of Thomas Hardy of Melcombe Regis, who in turn was a scion of the old Isle of Jersey family of Le Hardy. This Thomas Hardy died October 15. 1599. Nelson's Flag-captain, Admiral Sir Thomas Masterman Hardy, and the poet-novelist are alike his descendants. Our Thomas Hardy's father was a builder. His mother descended from a family in Melbury Osmund. At 16 he took up the work of an architect's assistant in Dorchester and three years later went to London and studied under the direction of Sir Arthur Blomfield. "How I Built Myself a House" was his first appearance in print. This was in 1865. "The Poor Man and the Lady" was the title to his first novel. This was returned with the suggestion for its change and he put it aside and wrote "Desperate Remedies." Then came "Under the Greenwood Tree" in 1872 and "A Pair of Blue Eyes" a year later. About that time he abandoned architecture for literature. With what effect he has written the world is now well informed.

No Hustle in Dorsetshire

THE way into Hardy's county is southward from London. Weyhill is on the course to the county town of Dorsetshire. From there are two routes; either through Winchester in Hants or through Salisbury in Wiltshire. It is to be questioned if there are anywhere more restful pictures which bring with them a perfect sense of repose than an English countryside. Even in the winter season a portion of the summer greenness remains, as in Blackmoor Vale, "where the fields are never brown and the springs are never dry." There is harmony here in united, infinite variety; and there are villages, ruins, churches, commons, hedgerows, thatched cottages and gardens ablaze with color, parks and dales and streams and moors while to the south there is always and ever the never-distant sea.

The reader who first encounters Hardy is going to be a bit puzzled at the names of his places. He will not find them on the map. Mr. Hardy's Wessex should not be understood to mean that division of Great Britain which in ancient times was known as Heptarchy and which comprised all of the shires which touch the English Channel, together with the adjacent shires to the north. The Wessex of the novelist mainly includes Dorset, with "excursions more or less distant into Wilts and some of the adjoining counties." Thus his "Casterbridge" is in reality Dorchester; "Melchester" is Salisbury; "Sherton-Abbas" is Sherbourne; "Budmuth" is Weymouth. In "A Pair of Blue Eyes" Mr. Hardy goes farther to the west and farther away from his main-traveled roads than in any of his other narratives. "Endelstow" where dwelt the fair Elfride—" with eyes blue as autumn distance; blue as the blue we see between the retreating moldings of hills and woody slopes on a September morning"—is the fanciful name of a hamlet near Bosnatle on the Cornish Coast.

Dorchester may be said to be the very heart of Wessex Country and a view of it from the slopes of the southern bank of the River Froom is one to remember. Chestnut and sycamore trees overlook the borough and the fertile river valley beyond. There is a comparative absence of commercial interests—none of the hustle nor bustle of the city are revealed in a walk through its streets and its suburbs. Near at hand are low, fertile valleys, but there are also the old Roman ways close at hand. Once they found, so Hardy tells us in "The Mayor of Casterbridge," the remains of an old Roman soldier "in an oval scoop of chalk, like a chicken in its shell; a jar at his throat, a spear against his arm, an urn at his knees, a bottle at his mouth; and mystified conjectures pouring down upon him from the eyes of Casterbridge boys and men."

His Characters Real Folk

IT WAS to scenes like this that he came back after his days as an architect were over. He was then about 30 years of age. His first novel, while it had its share of abuse as most first novels do, also had in other quarters a reception which gave to Hardy the feeling that he was coming to the first outposts of success. But there was hard work ahead, and years of patient training. Hardy is not what may be called the brilliant, rapid-fire type of writer.

A year after "Desperate Remedies" came "Under the Greenwood Tree," and is in no sense a reminder of anything which he has written since, but it showed progress and a beauty in workmanship and a quiet charm which he has never surpassed. Then came "A Pair of Blue Eyes." Not until 1874, however, when "Far from the Madding Crowd" appeared, did he strike that better pace which seemed to settle his career. Five years later a version of this, in which he had Mr. Comyus Carr as his collaborator, was performed at the Prince of Wales Theater, Liverpool. That was in February, 1882. Miss Marion Terry took the part of Bathsheba which rôle was assumed by Mrs. Bernard Beers when it was presented the following May at the Globe in London. "The Three Wayfarers," based upon his Wessex tale of "The Three Strangers," was performed with four other one-act plays at Terry's Theater in June, 1893. Just why more of Hardy's novels have never been transferred to the stage has always been more or less a puzzle to me. True, they would have to be much condensed, but in characterization and background many of them are admirably suited for acting. The performance of Mrs. Minnie Maddern Fiske as "Tess" is still within the recollection of many on this side of the Atlantic.

No writer has ever tried with more diligence nor with better effect to picture life as he has found it and as we all have found it than Thomas Hardy. He is there personally in every one of his stories. We can, in the rural regions of any English-speaking land today, find the counterpart of such characters as he has given us, homely personages of the country side; hay trussers, cider makers, stout farmers, weaklings who became submerged beneath the current of life, country innkeepers; creatures like Eustacia Vye and Arabella Donn, who love the life of the flesh rather than the intellectual or spiritual; they are all here portrayed. Hardy has been referred to ranking with Thomas Crabb (1754-1832) and indeed has acknowledged Crabb's influence on the realism of his novels. But unlike Crabb, he had not failed nor ceased to command a wide public interest. Crabb was the sternest word painter of the social life of all mankind and in this respect Hardy has to a measure followed him. And his characters seem well suited and well displayed in such surroundings.

This has been a more difficult feat in England than it would be in America. The former land, speak of it as we may as a democratic country, is after all a well-defined hierarchy of classes. "The sovereign, peers, spiritual and temporal, clerks and clergy, untitled gentry, lawyers in their several degrees, yeomen, merchants, artisans and peasants, build up society. Each class has its own duties, its own privileges, and enjoys that self-respect which proceeds from the sense of an assured immutable position in the commonwealth," declares Symonds.

But this is not the democracy which Hardy gives us in his novels. So far we have had but little of this sort of writing; too little of the kind we find in George Sand's village stories, in "Silas Marner," in Pierre Loti's "Mon frère Yves," in much of the work of Turgenieff, Tolstoi and Dostoyevsky and such as we find in "The Woodlanders," "The Mayor of Casterbridge," "Jude," "Tess," and "Far from the Madding Crowd." There is always present here and in the foreground of these stories a severe sincerity with also a corresponding intensity which is Hardy's from choice. With Crabb this narrow vision was one of necessity. Hardy's perfect knowledge came to him by inheritance and training. He was born in the heart of a woodland country.

No Change of Scene Needed

MOST of our great novelists have felt a change of scene necessary as a stimulus to their work but with Hardy this has not been the case nor has he found any new background necessary in order that the public might be kept interested in what he has written. One writer has said that this is all part of a bold experiment which might easily produce a great sense of sameness, but Hardy conducts it with such supreme skill that familiarity instead of dulling the interest becomes a new bond of attraction. One begins to be interested in these scenes for their own sake, and we realize the truth of his contention that there is in this apparently peaceful land ample material for Sophoclean drama. All of the passions capable of torturing or depraving humanity lie like a fiery volcano beneath a repose such as we find only in rural regions. He takes for his purpose a district of England—the only England he knows or seems to care to know—and peoples it with the creatures of his art, just as Balzac and Zola have done. "He has no dealings with the casual. He is always at work upon his scheme. This extraordinary definiteness of aim, this spirit of severe dedication to his task, produces an epic force, which constitutes the larger note in literary art." He uses all the frankness of the county in describing all the facts of life, and so gives to his stories much more austerity than if they had been written by a townsman. He well conforms to this type with his faults, those of the over-masculine temperament. When he is blunt it is for the purpose of adding strength to his narrative. Nature is a bit coarse in Wessex, and Hardy has in the composite given us true pictures of the life and deeds of these people.

The logic of events must trample its way over human hearts to its axiomatic close, knowing neither respite nor pause and is proof against all power or appeal of protesting sentiment. Sentiment is indeed never suppressed save as it enters into the telling of the tale in the only way that such characters as Hardy brings forward could have lived it. A difference between Hardy and many another writer is that they succeeded in telling a story well, but he has done more. He is the maker of literature.

Soviet Gold—Does It Go to Wall St.—Or Not?

Senator Borah Is Confronted With the Facts on Bullion-shipments From Bolsheviks to New York—as Compiled by the Government

FOLLOWING are excerpts from a speech delivered by Weston B. Estes at a luncheon meeting of the Women's Republican Club held Tuesday, April 3, at the Plaza Hotel, New York.

An editorial on this subject appears on page four of this issue of THE DEARBORN INDEPENDENT.

Mrs. President, Ladies and Gentlemen:

About a month ago, I gave a talk at a luncheon given by the National Republican Club and endeavored to present some of the reasons why, in my opinion, the government of Soviet Russia should not be recognized by the Government of the United States as the lawfully constituted ruling authority in that country. During the course of the speech, which in reality was an extemporaneous talk, I made some statements which I believed to be correct, but which did not suit the ideas of those who have arrayed themselves against the present form of constitutional government which we now have in this country. Inasmuch as the reaction to those statements came quick and hard, I am of the opinion that I must have trampled on some very tender toes. The day following was a Sunday, and Mr. Paxton Hibbon delivered an address which he was to have presented before the Republican Club to the Community Church of which Rev. John Haynes Holmes is the pastor. He characterized some of the things which I said as "silly, unfounded nonsense, that they heard from Captain W. B. Estes, once a prisoner of war in Russia." Laying aside the statement that I was a prisoner of war in Russia, which is inaccurate, unless we are agreed that Russia is now making war on the civilized world, let me call your attention to the second reaction. Report of my talk appeared in the papers of that Sunday, and on Monday morning one of the larger banking houses in this city called up a quasi-government bureau and desired to know whether that bureau had been "leaking" or not. Some of the quieter reactions to the truth are quite as illuminating as those which appear in the daily papers. On the following Tuesday, I went to Washington for the purpose of speaking before the convention of the Institute of Government, which was in session at that time. My speech there was delivered on Thursday morning, and practically the same statements were made there. I did not know that on the previous day, Wednesday morning, Mr. Borah made a speech in the Senate of the United States, a speech asking for the recognition of the Soviet government, in which he took me to task for inaccurate statements. The details of this I shall present in a moment. The *New Republic* and *The Nation,* as is to be expected, followed suit, and now I find myself, so far as world revolutionaries are concerned, crushed to earth, with a hope on their part that there will be no resurrection. These revolutionists have built up a supposedly impregnable wall of propaganda about us, which, when it comes down to facts, is about as stable as the proverbial house of cards. A fact always causes a scramble for a new base. So I am doubly gratified at this opportunity to speak again under circumstances which will brook of no misinterpretation and misquotation. Having been designated on the floor of the United States Senate as careless in my use of information and my name having been recorded in the *Congressional Record* as connected with a "venal and corrupt propaganda" I am entitled to be heard in the broadest manner, and I can assure you that my answer would have been forthcoming much sooner but this is my first opportunity.

A Few of Borah's Errors

TO QUOTE Senator Borah, as it is given in the *Congressional Record*:

"To give you an idea, if I may turn to it hastily, about the manner in which this cause is repeatedly presented to us, Captain Estes, in making a speech a few nights ago in the city of New York before the Republican Club, states, according to the press dispatch, as follows:

"'Captain W. B. Estes, who was kept in a Soviet jail in Moscow for a year during the World War, declared that to his certain knowledge there is in New York banks to the credit of the Lenin-Trotsky government, $540,000,000.

"'He said: "New York banks held at least $180,000,000 in gold while I was locked up in jail, and the deposits are three times that sum now. The most of it is with Kuhn, Loeb & Company, and the Guaranty Trust Company, although many other banks have heavy deposits. Much of it is in old Russian rubles."'"

While it makes little difference and only shows how inaccuracies creep into any controversy of this nature, let me say that I was not in a Moscow jail during the World War. I was wearing the uniform of a captain in the United States Army until the Armistice was signed, and when the latter event occurred was on the point of sailing for France. In the second place, I did not mention the name of the banking houses of Kuhn, Loeb & Company, in that speech, and perhaps some here who may have heard me at that time will bear out that statement. Somewhere between the club house of the National Republican Club and the floor of the United States Senate, some bright young newspaper man put the words "Soviet gold" on the one hand, and the words, "Kuhn, Loeb & Company," and the "Guaranty Trust Company," on the other into juxtaposition. I wonder how he could have hit upon those two banks. In the third place, I did not use the figure $540,000,000 in my speech at all. In the fourth place, I did not say that any hypothetical balances were to the credit of the Lenin-Trotsky government. In the fifth place, I did not say that "much of it was in old Russian gold rubles." Aside from these five inaccuracies, the statement as given by Senator Borah on the floor of the Senate is fairly true.

Further, according to Senator Borah: "The intention undoubtedly was to disclose that Lenin and Trotsky were not only tyrants but also engaged in robbing their people, pushing their money out of the country which they were wrecking, so that in the hour of escape, they would have something with which to take care of themselves."

That is exactly the idea that I attempted to convey, and I am under obligations to Senator Borah for expressing it better than I could have done, however much liberty he may have taken with certain facts to substantiate his conclusions.

The Senator proceeds to state that he telegraphed these two banks the following:

"Are you free to state to me the facts concerning the statement of Captain Estes relative to Lenin-Trotsky government having large deposits in your bank?"

Kuhn, Loeb & Company replied, according to Senator Borah:

"We are in receipt of your telegraphic inquiry. We have never had any dealings of any nature with the Lenin-Trotsky government, and have no deposit, directly or indirectly, for their accounts."

The president of the Guaranty Trust says:

"I assume your telegram of today refers to Captain Estes' statement before National Republican Club . . . . We have no deposit here to the credit of the Soviet government, either in gold or otherwise."

Government Has Facts

NOW, in appealing to these two banks, Senator Borah has laid himself open to some very appalling suggestions. It appears like discharging a convicted murderer from prison because he denies the act. I have wondered many times, since reading Senator Borah's speech, whether he really thought that this exchange of telegrams would convince anyone who is even in the remotest degree acquainted with the facts. You will remember that during the war, army psychologists established the fact that forty-two per cent of our population are morons. I wonder whether Kuhn, Loeb & Company and the Guaranty Trust Company have missed slightly in their calculations and believe, actually believe, that the intricacies of banking are so great that not forty-two per cent but ninety-nine per cent of the adult population is moron, so far as banking procedures are concerned. Furthermore, I have watched the career of Senator Borah for some years with increasing interest. His tirades against bankers and banking, particularly of those who, like the Bolsheviks, prune themselves on the designation "international," have been more than severe, they have been bitter. Why did he turn to those for reply who have been the object of his oratorical lash, unless he was pretty certain that the limitations of his inquiry would bring the reply that he desired? How many telegrams did he send which brought replies that he did not publish? Since when has Senator Borah changed his attitude toward international bankers to one of supreme confidence on the subject which must of necessity have been one where there was a possibility of obscuring the issue through personal interest?

There are three government bureaus at Washington whose business it is to keep track of the travels of every pound of gold in the world. Why didn't Senator Borah ask and receive and publish official information on this subject in the interests of truth and regardless of the consequences to himself? Is it because of advance knowledge of what the answer would be? He certainly could have had the information if he had asked for it, and could even have found it in the papers and official reports if he had chosen to look it up.

Now, exactly what I said two weeks ago was this: That there was approximately $180,000,000 of Soviet gold in Wall Street. The information on which I based that statement was of such a character that I believed I was telling the truth. As a matter of fact, I, too, had fallen into an inaccuracy, and I find upon reinvestigating the subject that I was mistaken in the figures given. Instead of being $180,000,000, there is $250,000,000 in Soviet gold in Wall Street, and that Senator Borah may have first-hand information on the subject, I shall give you authority for making the statement.

In the first place, when I was in Esthonia in June, 1921, I stood in front of my hotel one day, when I was informed that a shipment of gold was being transferred from the Esthonian National Bank in military motor trucks to a Swedish steamer tied up at the docks. I went down to the water front, and saw a large number of cases of gold under soldier guard being transferred to the steamer. My associate in the meantime had been interviewed by Isador Gukovski, Soviet commissioner in Esthonia, and had been requested to take motion pictures of the event because Gukovski was anxious to get some material for publicity purposes. Gukovski told him that the shipment was one of gold belonging to the Russian Soviet government—and Gukovski certainly acted as if he were wholly responsible for its safety—and also said that it was going to Sweden. During that month, to my personal knowledge, there were three such large shipments. Estimated by the number of cases, and the apparent weight, there could have been not less than three or four millions and a half in each shipment. Mind you, three such shipments to Sweden in one month from Moscow.

I found upon investigation that the shipments of gold from Moscow to Stockholm by the time I arrived at Reval were so numerous that they had long ceased to excite wonder. It was a matter of common knowledge. But lest there may be some doubting Thomases still, let me refer to some good responsible authority. We can start almost anywhere. Take for instance the following dispatch which appeared in the New York *Evening Globe,* date of April 14, 1922, sent from Stockholm, and signed by Hal O'Flaherty. It stated that between January 11 and April 14, 1922, the American consul at Stockholm had issued permits to export Russian gold to the United States in the amount of $34,345,500—in four months and three days, Mr. O'Flaherty adds: "Ostensibly, these shipments of gold mean credit in New York for Swedish banks but indirectly the Soviet government is piling up a credit which in the last two years has reached $200,000,000."

About one month later, on May 10, 1922, the financial column of the New York *Times* had this to say:

THE $3,000,000 FROM RUSSIA

Gold Coins Are Reported to Be for Bolshevist Credits Here.

"A total of $3,000,000 in Russian gold coin arrived in this country yesterday of which $2,000,000 was consigned to the National Bank of Commerce and $1,000,000 to the Guaranty Trust Company. The purpose or history of the consignment was not known but it was reported to be Russian gold, sent to this country to establish credits for the Bolshevist government."

I have given you only two of numerous clippings to which I have had access which indicates a flow of gold directly or almost directly from Moscow to New York. It is impossible to say how much there has been of this, as in all human probability many shipments have not been advertised in the papers. To be perfectly fair, and to forestall a large noise from our Revolutionary friends, I might add that from this particular lot of gold some should be subtracted to care for a legitimate payment to the American Relief on account of famine relief but this amount is a relatively insignificant amount compared to the whole.

We will find, however, that there is a great deal more interest to be attached to that Russian gold which had as its first stepping point Stockholm. There can be no question about the large quantity. I again found clippings galore concerning this golden stream. For instance, the New York *Times* of January 2, 1923, in its financial column says: "In 1921 Russian gold was exported to France and Sweden in large quantities and re-exported to America." The New York *Times* of February 7, 1922, has an item headed: "Forty tons of Soviet Gold in Sweden." "Copenhagen, February 6.—From Reval the steamer *Gladiator* has reached Stockholm with from twenty-five to forty tons of gold—said to be the largest amount of gold which ever arrived in that city. It is consigned from the Soviet government to two banks in Stockholm."

How the Shipments Roll Up!

AUGUST 20, 1922, the *Times* speaks of $3,000,000 bullion Russian gold arriving in America. On February 3, 1922, the *Times* describes the arrival in New York of $2,500,000 Russian gold with Swedish mint marks from Stockholm, February 9, 1922, $4,939,200 of the same kind arrived in New York. The day before, $2,500,000 also arrived from Sweden. According to the *Times,* quoting a Department of Commerce report on gold movements, there arrived in New York during the one month of March, 1922, $14,938,204 in bullion, from Stockholm. The *Times* of June 25, 1922 states that in the month of April, 1922, $1,587,000 in bullion with Swedish mint marks arrived in New York comparing the arrivals of April, 1921 from the same place which totaled $24,800,000. In other words, the stream of gold from Russia was out of that much disturbed country and safely in New York. The stream began to slow down.

Department of Commerce reports indicate to us that gold arrived in New York from Stockholm as follows:

Total for year	
1921	$66,355,925
1922	32,797,000

I have been unable to get the figures from 1920. The gold movements from Moscow to Stockholm and New York began in the latter part of 1919, and continued until last summer. I estimate that the shipments of this character could not have been less than $50,000,000 and was probably more. This totals roughly for the three years, $150,000,000 which does not include that which came through from Moscow direct. There is still another year to be accounted for, from which should be subtracted a few hundred thousand remelted Japanese gold which may have belonged to the Soviet government at that, and also a few millions a year to cover Swedish balances. There was no other source for this Swedish gold except Russia. No other country had it. German gold to London and New York followed other channels. But why did it stop at Sweden?

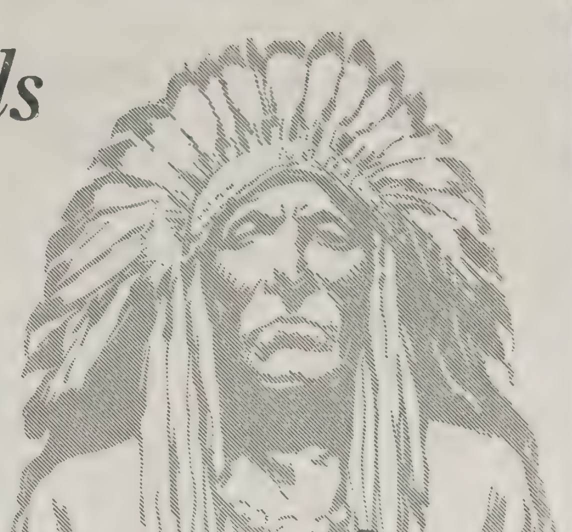
When the first Soviet gold arrived in this country after the second revolution, the Treasury Department made a ruling to the effect that United States mints

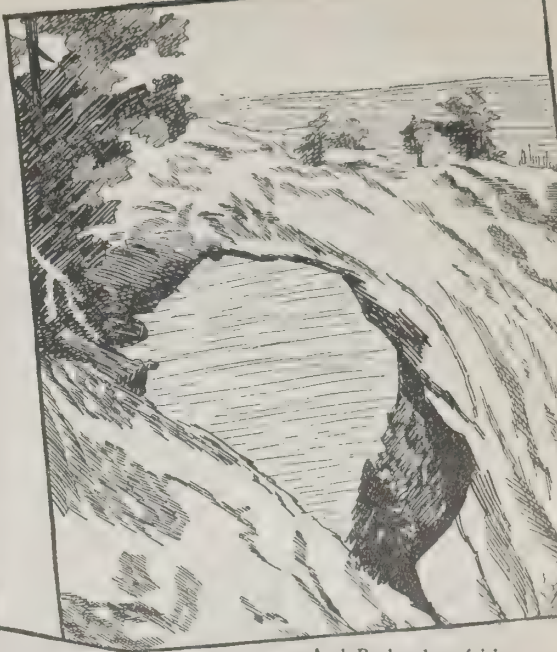
(Concluded on page 14)

Fairy Isle of the Blue Straits and Its Legends

Indian Tales That Go to Make Up History of Mackinac

By MRS. E. L. MOUNTFORT

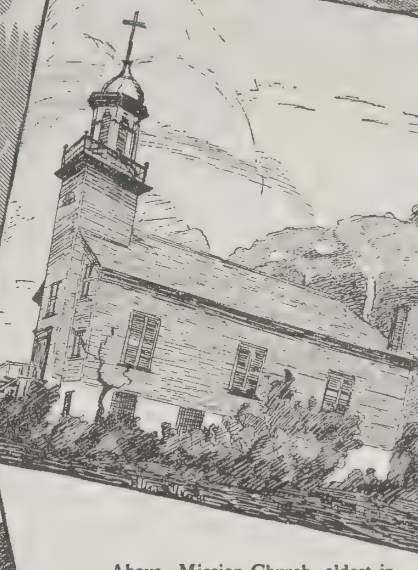




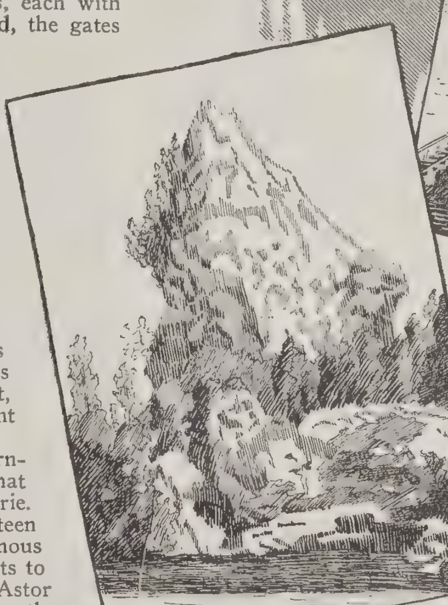
Arch Rock, where fairies come on moonlight nights.

IN THE very heart of America, land of rattle, crash and bang, tucked away in the cold, blue Straits between Huron and Michigan, lies an island only nine miles in circumference, whose shady drives and quiet lanes know not the siren honk of the automobile, since not one is ever allowed to land there, and the horse is still monarch of all he surveys.

Here old Fort Mackinac rears its stately head, a military post for nearly 200 years, but now a fort in name only. Within the intersecting lines of the three blockhouses once lay the fort inclosure, with its two approaches, the north and south sally ports, each with its portcullis that could be instantly dropped, the gates doubly planked, that could be closed any time, day or night. Strong, squared palisades of cedar, eight feet high and pointed on the top, were set vertically along the walls and in the ground intersecting the inner lines of the blockhouses, and were, in turn, pierced by loopholes for musketry which was angled from within outward, so that, standing or kneeling, the fire could be delivered toward the enemy in any direction. Near the blockhouses, sharp-pronged iron caltrops were set in the apses of the pickets, like spikes, wherever the ground seemed to favor scaling parties. The blockhouses themselves were armed with iron cannonades that protected the picket walls of the fort, and iron guns were planted at convenient places so as to rake the hillsides.



Above—Mission Church, oldest in the Northwest.

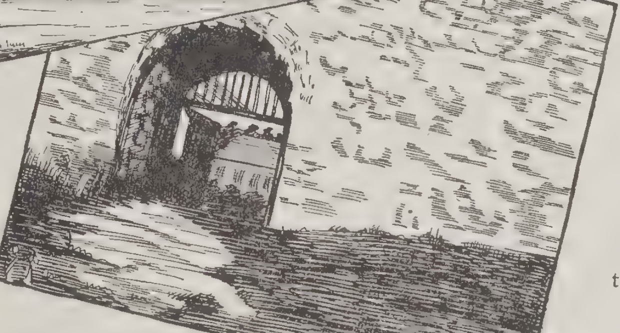


At left—Sugar Loaf, Manabozho's Wigwam.

Guns captured from Burgoyne and Cornwallis grace the old fort, as does a cannon that was in Commodore Perry's battle on Lake Erie.

To this island, Mackinac, in the eighteen hundreds, came the Canadian *voyageurs,* famous in song and story, eight to a boat, three boats to one guide, to barter their furs at the old Astor House. The most skillful were paid $50 for the round trip, Montreal to Mackinac and back.

The Indian legend has it that when Manabozho, the Great Hare, whose father was the West Wind and his mother a great-granddaughter of the Moon, was assigned the task of restoring the world after the Deluge, he called on the animals for aid. They were glad to assist and finally the muskrat fished up some mud on his claws. This Manabozho fashioned into land, giving it the shape of a mud turtle and called it Mackinac or Turtle Island.



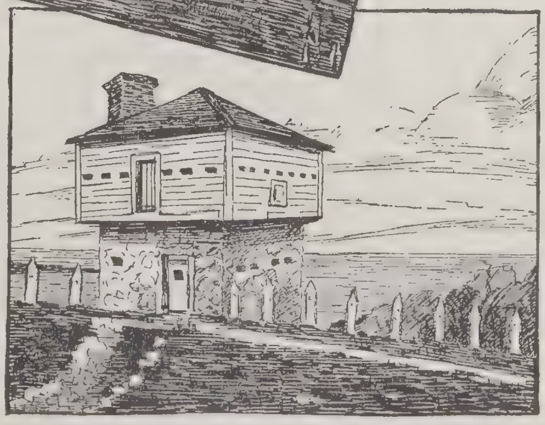
Sally Port, closed with portcullis to guard fort inclosure, through which garrison could pass when necessary.

Because it was the first land made Manabozho always made it his home and, when returning, always steered his craft toward the Gitchie Manitou, a great boulder, erected ('tis alleged) to commemorate his deeds. From there he ascended the Giants' Stairway, making a good resolve at each step, passed beneath the portal of Arch Rock and thence on to his wigwam, Sugar Loaf.

Sugar Loaf is of limestone, 284 feet above the lake, and is said by the Indians to have been made a gigantic hive once by the bees who filled every crack and crevice with honey. Another tale is that it is the transformed body of a giant who once dwelt there and that he will come back to life when Hiawatha returns to the island. (It was the Ojibways, a part of the Huron tribe, who were immortalized by Longfellow in Hiawatha.)

The summit of Arch Rock is 149 feet above the lake, with a span of 50 feet. 'Twas formed ('tis said) by Giant Fairies who may still be seen hereabouts on moonlight nights—by those who have the eye to perceive them. As substantiation, near by is the Manitou Trail, leading from Arch Rock along the bluff to a place called Robinson's Folly, where Captain Daniel Robinson, commandant at Mackinac 1782-1787, loved, not wisely but too well, the beautiful Wintemoyeh, youngest daughter of the old Chippewa chief, Peezchicki, and who, in turn, loved him, but she was already betrothed to an ugly brave, favored by her father but hated by herself.

Wintemoyeh and Robinson, therefore, were secretly married and he built a love nest on the edge of the cliff, where they could watch together the sun as it rose up out of the blue, blue waters. But the jilted brave discovered their retreat, and, creeping up one dark night when Robinson was away, he sunk his wicked hunting knife into the heart of the young bride, just as her husband returned. In the terrific struggle that ensued the two men, not noticing, came nearer and nearer to the edge of the cliff, until they both fell over to instant death on the rocks below.



Blockhouse of old Fort Mackinac.

At the west end of the island there is another like legend. This one has it that a renowned Indian warrior, Wawanosh, chief of an ancient tribe and prominent in the councils of his nation, had one child only, a daughter named Lotah, who was loved by a youth of humble parentage, Geniwegwon. But Wawanosh bade Geniwegwon first earn for himself a name worthy of Lotah.

Before ten suns had set the young lover was at the head of a band of ambitious braves, painted and feathered according to their custom, and after two days and nights of the war dance at the Straits, as braves were wont to do, Geniwegwon bade Lotah goodby.

Thereafter Lotah spent much time alone and grieving. One day, as she sat alone on the bluff, sadly singing, a snow white bird appeared and mingled its song with her own. She at once knew the bird for the spirit of her lover and petitioned it to take her with him to the Country of Souls. The request was granted. That evening her father found her lifeless body at the foot of the cliff, but a happy smile wreathed her face. That place has ever since been known as Lover's Leap.

The Manitous were supernatural beings, both good and bad, and they revealed themselves to mortals only in the form of beast, bird or reptile, usually distorted. They controlled the destinies of mortals. Each Indian early chose his guardian Manitou, to whom he looked for counsel, guidance and protection, the choice being made only after extreme fasting, then falling upon that animal first or most often appearing to the Indian in his sleep of exhaustion. A feather or bone of the animal or bird was always worn about the person thereafter. This was his medicine to which he yielded a sort of worship.

There was one, Wazhuska, or Chusco, a black art Indian called the "Magician of the Manitoulin Islands," who pretended to have spiritualistic powers. He would allow himself to be bound with whitewood withes in a canoe sail, and so placed within a rude pyramidal lodge of poles and skins, entirely shut in and firmly secured by imbedding the ends of the poles in the ground. Soon the lodge would begin to sway to and fro to Wazhuska's chant. Next came a rustling sound at the top which indicated the presence of the spirit. The person for whom the spirit had been invoked could then ask questions. Wazhuska insisted that it was all genuine, but he did admit that the spirits might be evil, Once the commander of the fort, when a boatload of supplies was delayed, invoked the aid of the black magic artist and was told the then position of the boat, the reason for its delay, and the date of its arrival in port, all of which was later corroborated.

Across the water at St. Ignace is a peculiar shaped rock, like a rabbit's back. Here, once, Manabozho, the Great Hare, conferred upon a Huron the gift of immortality, tied up in a bundle, but with the proviso that he must never open it. His wife, however, filled with curiosity, cut the string and away it flew. Ever since that time Indians have been subject to death.

Many, many were the legends of the island, for these child-minded people had the fairies interwoven with even the most prosaic things of their existence. There was the Wishing Well, or Spring, where one must drink and wish and keep it secret for three days if one would have it materialize.

There is a deep crack in the island, several feet wide and some rods long, asserted to be widening. Some say it is the relic of an extinct volcano, although it looks like an earthquake fissure. But the Indians have it that the island will split in two some day, destroying all.

The name Ojibway, or Chippewa, means: "To roast till puckered up," called so because of the puckered seam on their moccasins.

Distances were told as: "Two pipes off," or the distance one could walk while smoking two pipes full of tobacco.

It is related of one poor Indian of the island, fleeced of many fine beaver pelts and of about $500 for labor by an unscrupulous American, that he sent a letter to the President of the United States and requested him to pay it.

There are no "cuss" words in the Indian tongue. Their nearest approach to such is "Bad Dog," and it is considered very bad indeed to call any one by that name.

They had some good traits and some bad, those Indians, just as do their brethren of a paler color, but that they were not ungrateful is brought to mind when one looks across the Straits to Bois Bleu (contracted to, and universally known as "Bob-lo.") This entire island was ceded to the Americans as a voluntary gift from the Chippewas.

Pontiac, greatest chief of the Ottawas, aghast at the continued encroaching of the whites, in 1763, here planned his stupendous uprising that was to have wiped out a dozen forts and all of their garrisons, and which really did succeed in annihilating nine of them, so masterfully was it planned and executed.

"Source of Our Misfortunes and Corruption"

Thus Senator Ladd Characterizes the "Independence of the Judiciary"

By EDWIN F. LADD

SENIOR SENATOR FROM NORTH DAKOTA

This is the third and last article by Senator Ladd.

THE independence of the judiciary and their exemption from any responsibility to the people whom they are supposed to serve has long been characterized and is still endorsed by legal and political writers as a triumph of the spirit of freedom. Yet here is the source of all our misfortunes and corruption of government.

Hamilton, who often spoke in terms of centralized power, says:

"Upon the whole there can be no doubt that the convention acted wisely in copying from the models of those constitutions which have established *good behavior* as the tenure of their judicial offices, in point of duration; and that so far from being blamable on this account, their plan would have been inexcusably defective, if it had wanted this important feature of good government. The experience of Great Britain affords an illustrious comment on the excellence of the institution."

The foregoing is quoted with unqualified approval by Story in his Commentaries on the Constitution, and bears the endorsement of the very highest names among the expounders of the Federal Constitution. And yet, widely accepted and deeply rooted as it appears to be among the members of the bench and bar, it is not supported by historical facts and is manifestly repugnant to the spirit of a popular government. With all due respect for the eminent authorities who profess to place so much stress on the political experience of foreign governments, I have no hesitancy in declaring that it is not countenanced by analogy or warranted by the facts marshalled in its support.

Found Ready Acceptance

IT IS not to be wondered at that such an assumption should have found ready acceptance by a profession that is generally controlled by precedents and authorities. But it is surprising that an assumption which upon examination is found to be so groundless could have been successively accepted by so many disinterested and acute thinkers as have in recent years devoted their intellectual powers to the elucidation of the various clauses of the Federal Constitution. We go to the very heart of the subject in saying that there is no warrant either in experience or analogy for the assumption that a judiciary independent of the people is an "important feature of good government." The fact is the very reverse of this.

Let us consider the conditions which gave rise to the doctrine that the judges should be independent of the people. Prior to the passage of the Settlement Act of 1701 the crown appointed and removed at his pleasure the judges of England. This power of appointment and removal, history shows, placed the judges under the absolute control of the king and made it possible for him to use them as subservient tools to enslave and oppress the people.

A striking illustration of the manner in which this power could be used was exemplified in the brutal ferocity of the notorious Jeffreys and Scroggs, the cowardice of Guilford and the base venality of such judges as Saunders and Wright under James the Second of England. We have, as many now maintain, an imitation of this abuse of power in our Federal courts, in what is known as "government by injunction." However, the Act of Settlement deprived the king of the power to remove judges on his own motion and conferred it upon Parliament, the representative of the people. The primary purpose and ultimate object of this act was to make the judges independent of the arbitrary power of the crown, but it also made them responsible to the people through the people's representatives who had the right to demand their removal.

English Judges Not Independent

THE statement so frequently made and so generally accepted, that our Federal judiciary is modeled after that of England, will not stand impartial investigation. English judges are not now and never have been independent in the sense that the term is used with reference to our Federal judiciary. Making the judges independent of the king was making them responsible to the people through the people's legislative department of the British Government. To have made them actually independent would have been to appoint them for life, and exempt them from responsibility to kings, lords or commons. This would have been to create a new despotic power as dangerous as the king's, which the people were determined to destroy.

"In England where judges were named and removable at the will of an hereditary executive, from which branch most misrule was feared, and has flowed," says Jefferson, "it was a great point gained by fixing them for life, to make them independent of that executive. But in a government founded on the public will, this principle operates in an opposite direction and against that will. There, too, they were still removable on a concurrence of the executive and legislative branches. But we have made them independent of the nation itself."

As a matter of historical fact there is nothing in the political annals of England to support the assumption of an independent judiciary. The judiciary there do not even pretend to constitute a co-ordinate branch of the government and dare not attempt to enforce their opinion in opposition to that of Parliament. Instead of being independent, they are strictly obedient to the commands of Parliament, whose supreme power they never think of questioning.

In view of these historical facts, it is hardly necessary to assert that the courts of England do not exercise legislative functions. While our Federal judiciary are independent of the people, as they are appointed for life by a power which has never yet considered the will of the people as entitled to any consideration, yet they are not independent of the beneficiaries of the predatory privileged corporations and law-evading trusts and combinations which have secured their appointment would seem to be proved by their long series of decisions in their favor rather than in the protection of the poor and, at times, oppressed workers.

In a truly representative government, an independent judiciary would be an utter impossibility. An agent that is independent of his principal is not an agent in any true sense of the word. A principal is responsible for the acts of his agent, but he could not be held responsible for the acts of one who acted independently. Therefore a public agent acting in the name, and by the authority, of the people cannot be rightfully, legally or constitutionally independent of them. It would be a contradiction in terms to say that a public agent paid by the people to perform certain public duties in their name and by their authority was independent of those who paid for the service. This inevitably leads to what it has led to in this country—a confused jungle of judicial ambiguities and contradictions so that it has become impossible for any power short of omniscience to tell at any moment of time what the law is. What the law was yesterday or today is no criterion of what it shall be tomorrow or the day after.

The provision in the Federal Constitution for the life tenure of a non-elective judiciary was deliberately designed as a check, as was the case in England, upon an irresponsible executive, but also upon the direct repositories of the people's authority, the Congress of the United States. Its clear, definite and unmistakable purpose was not to augment but to diminish the people's control over their own government. Though professing to follow the English model, the framers of the Constitution rejected it. They not only gave the Federal judges a life tenure, but made that tenure unqualified and absolute, by withholding from the Congress the removal of judges, a power which the British Parliament wrested from the crown.

Natural Relation Reversed

THIS has reversed the natural and necessary relation which ought to exist between the legislative and judicial branches of a government making any pretense of being representative, and has raised the Federal judiciary from a dependent and representative position to one that has made it an independent oligarchy, and vested it with power unknown to any other government on earth. It is literally true as Jefferson says: *"It is a misnomer to call a government republican, in which a branch of the supreme power is independent of the people."* The essential feature of a government by the people is wanting when the people's representatives cannot make laws without the consent of a body over which the people have not only no control, but who may be chosen by the beneficiaries of predatory privileges whose interests are diametrically opposed to that of the people. Instead of having what the framers of the Federal Constitution were proud in styling an independent judiciary, we have in reality what may at times become a very dependent and subservient judiciary, apart and independent of the people.

Chief Justice Clark, of North Carolina, says: *"At the present time the supreme power is not in the hands of the people, but in the power of the judges, who can set aside at will any expression of the people's will made through an Act of Congress or a state legislature. These judges are not chosen by the people, nor subject to review by them. This is arbitrary power, and the corporations have taken possession of it simply by naming a majority of the judges."*

Chester H. Aldrich, former governor of Nebraska, at the Governor's Conference, held at Spring Lake, New Jersey, September 14, 1911, in the course of his remarks, criticizing Federal Judge Sanborn for his decision in the Minnesota rate case, said: "Therefore, I say, when any court, whether it be the United States Supreme Court or a court of inferior jurisdiction, continually makes effort by a judicial decision to do that which the people and the people alone have a right to do, then I say that such a court is seeking to establish judicial tyranny. And if it be allowed to proceed unchallenged along the line of this unwarranted assumption of power, representative government will simply be that in name only."

President Hadley, of Yale University, says: "The general status of the property owner under the law cannot be changed by the action of the legislature or the executive, or the people of a state voting at the polls, or all three put together. It cannot be changed without either consensus of opinion among judges which should lead them to retrace their old views or an amendment of the Constitution of the United States by the slow and cumbersome machinery provided for that purpose, or, last—and I hope most improbably—a revolution."

But the distinguished professor is very much in error in holding the opinion that an amendment to the Federal Constitution or a revolution is imperatively necessary to deprive the Supreme Court of the United States of its usurped power to declare an Act of Congress or of a state legislature void and null because of its supposed repugnancy to the Federal Constitution. *All that is necessary is to pass a simple amendment to the Judiciary Act of 1789 and deprive it of appellate jurisdiction.*

Even members of the courts are beginning to recognize that the courts have usurped power that never would have been accorded to them. Listen to no less a person than Justice John R. Ford, of the New York Supreme Court. Recently discussing SHOULD JUDGES REPLACE KINGS, he makes this significant statement:

> "How do I become entitled to more respect as judge than was accorded to me as Senator? There is absolutely no sound reason for it and the only justification that can be urged for the custom of exalting judges above other public officials is that it has always been so. The sooner American citizens get rid of this idea that a judge is more honorable than a legislator, and that a court is entitled to more respect than a legislature, the clearer will become our perception of the evils of judicial usurpation—the most threatening present-day danger to our democracy."

Conscious of Their Power

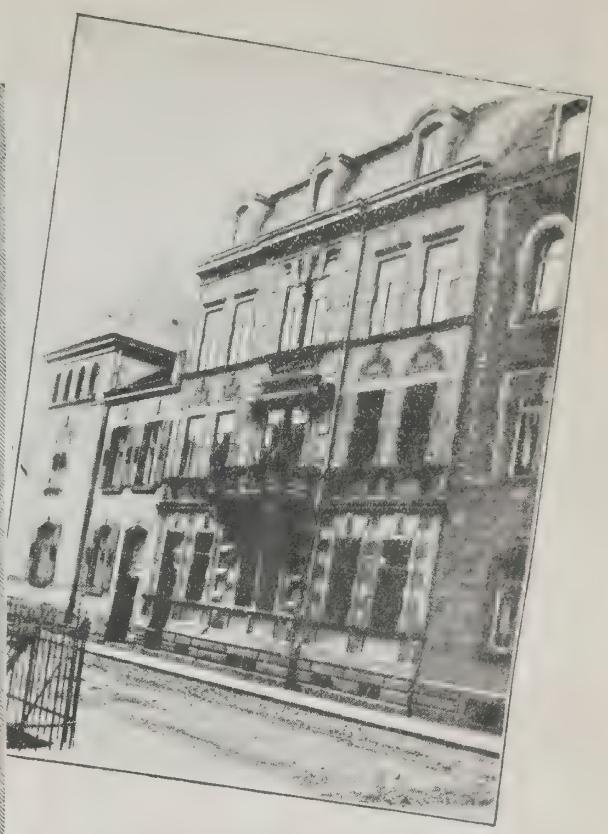
LET us not mistake the spirit of earnestness and determination that is animating the masses of the people, born of the industrial wrongs and judicial injustices that today blacken our civilization. The people are becoming conscious of their political power and are inflexibly determined to exercise it, to establish an industrial system based on the law of natural justice.

The present system is universally admitted to be indefensible and intolerable as administered under some conditions. An arrangement that permits and approves that a privileged few may receive without producing and condemns the industrious many to produce without receiving, that enables the few to enjoy without earning and the many to earn without enjoying, will inevitably evolve anarchy and invite destruction. The hopes and dreams born of the marvelous increase of productive power which has given to our wonderful era its pre-eminence, the producing classes are determined to bring to full realization. The material forces and occult powers of nature must in the future be utilized for the benefit of all. Involuntary poverty must be abolished. And the vice and crime, the ignorance and brutishness, the sordid selfishness and insatiable greed, which are engendered by poverty and the fear of poverty, will vanish when their cause is removed. Industrial development will elevate society from its very foundations, exempting the weakest and most inefficient from all anxiety for the physical needs of life. Properly adjusted these marvelous industrial improvements with their muscles of iron, sinews of steel and nerves of invisible power will bring forth bounteous material conditions, in which our higher powers, nobler qualities and most generous impulses will have ample opportunity and scope to grow. Mutual assistance and reciprocal co-operation will supplant stupid selfishness and cutthroat competition. Children will no longer be stunted and starved from overwork and undernourishment but will know the joy and innocence of life's morning. Workingmen will no longer be harried and harassed by want of employment in the midst of unused natural resources; the rich no longer dehumanized by insatiable greed. The poorest and weakest will have the leisure and contentment essential for the development of all their natural faculties.

"A Gathering Storm"

THE at times apparent hostility of the Supreme Court to the interests of the producing classes have made such an impression on their opinions as radically to change the currents of their thought and to eradicate worn-out conceptions of popular government. They fully realize that as long as the Supreme Court of the United States, a non-elective and irresponsible body, is permitted to exercise an usurped power and declare a law, passed by the legislative department as representing the will of the people and approved by the executive, null and void because it diminishes the predatory privileges of an unscrupulous few; progress cannot be real, nor prosperity permanent. But they now feel the animating spirit of a great deliverance. They behold the faint beams of the sun of industrial liberty rising above the political horizon, to set no more. The entrancing visions of higher and grander and nobler possibilities are not merely gathering power and glory, but their angle has changed—instead of seeing in the past the vanishing gleams of an expiring sunset, all the beauty and promise of a brighter day deck the skies before.

My one purpose and desire in these articles has been to present a layman's views of a most important and fundamental question now being discussed generally in all walks of life among the masses who are seldom wrong with regard to the facts which they observe and the conditions that exist, but who may not really discern the remedy and so have their energies turned into blind alleys and the simple and real remedy be lost sight of until it is too late to escape the vengeance that is certain to follow. If I have succeeded in pointing a way to escape this gathering storm which is before us as a nation, I shall have succeeded in this endeavor.



A Home "For a Song" If You Have Dollars

A resident of Washington, D. C., born in Germany, now an American citizen, has purchased these five substantial residences in Berlin for a sum equal to $5,000. Many millions of marks, it is true, and each of the five is said to be worth $25,000. One chapter of the story usually left untold is the fact that taxation levied against owners is terrifically high—even when measured in our coinage.

A Colonial Empire That Was: Fate of Germany's Possessions

Concluded from page 7

bacco raising, and grape growing had been started with some success. Gold and diamonds were also found but the colony was far from self-supporting. The main source of worry to the German government was the constant rebellion of the natives. Among the chief exports were guano and animal products.

Togoland was Germany's smallest possession in Africa and her pet colony. It lay between Gold Coast on the west, and Dahome on the east. The population totaled more than a million Sudanese, with but a few hundred Germans. Togo was one dependency which was self-supporting, its commerce being very active, and was by far Germany's most proficient colony. The resources of the land were considerable and the Germans were hard at work developing their opportunities to the utmost. Lome was the chief seaport and the seat of the imperial governor. There were two government schools and 141 mission schools with 5,200 scholars. The country had fine roads and connections; and a railroad ran between Lome and Little Popo, the next most important city. Telegraph and telephone service was also very highly developed in Togoland. The bulk of exports consisted of palm nuts, oil and rubber.

The island of New Guinea, the second largest in the world, is situated about 80 miles northeast of Australia. It was jointly controlled by the English, Dutch and Germans. The northern half of the east region, an area of about 70,000 square miles, with a population of 15,000 natives, belonged to Germany, and was called Kaiser Wilhelm's Land. Conspicuous about the island are the large number of forests filled with enormous trees including the camphor. The most important products of value to Germany were copra, gold, pearls and shells, sandalwood and trepang.

The Bismarck Archipelago supplied Germany with coffee, copra and kapok, a sort of cotton.

Discovered by the Spaniards in 1543 and sold to Germany in 1899 were the Pelew Islands, a group of twenty-five islands southeast of the Philippines at the west end of the Caroline Islands. The Pelew Islands are well-wooded, mountainous and are surrounded by coral reefs. The soil is fertile and the climate healthy. The entire group is only 170 square miles in size, and inhabited by some 10,000 natives of the Malay race.

By the treaty of 1889, the United States, Great Britain and Germany assumed joint control of the islands in the Samoan or Navigator Archipelago in the Pacific. This arrangement continued until the year 1898 when King Malietoa Laupepa died, and disturbances at once arose regarding the succession. A joint committee which was appointed recommended among other measures the abolition of the kingship. The final result was that by the Anglo-German agreement of November 14, 1899, accepted and ratified by the United States in January, 1900, Great Britain renounced all rights over the islands as regards the two largest, Savaii and Upolu, in favor of Germany; and in favor of the United States, as regards Tutuila and the other islands. Savaii is the largest of the group, being about 47 miles long and 28 miles wide, the total area covering approximately 1.000 square miles. The chief town of the islands is Apia, on a bay in Upolu. The islands are mountainous and have very rich soil. In spring there are usually disastrous hurricanes, but the climate is generally favorable. Samoa does an extensive trade with the United States at San Francisco, and with Australia at Auckland and Sidney.

In the Orient, Germany was represented by her war-famous Kiaochau, a protectorate on the coast of Shantung in China. Its capital was Tsingtau, a fortified seaport with a dockyard and naval station. Germany obtained a ninety-nine year lease on Kiaochau from China in January, 1898, but the Japanese took it away from her during the early months of the war. The area of the protectorate comprised about 200 square miles, with a population of 170,000.

This, in brief, completes the survey of the German territorial and colonial possessions as they were before the fateful years 1914 and 1915. It seemed as if the firebrands from the European conflagration burned with a ferocity that swept all before it in the colonies. No sooner had the first shots been fired in France and Belgium than the British, French, Japanese and natives rushed to their respective colors in the neighboring possessions and set out to crush German colonization once and forever. In Africa, the French and British colonial forces began extensive campaigns which meant doom for the small garrisons of German troops and loyal natives stationed on German territory.

Togoland was the first to give up the fight. She surrendered or capitulated August 27, 1914, being no match for the invaders, as she possessed only a small police force. The Germans did succeed, however, in defending their big radio station, Kamina, for several weeks. Next fell German Southwest Africa which was conquered by General Botha with troops from the Union of South Africa in May-July, 1915. Kamerun was next in order, being subdued in February, 1916. German East Africa held out the longest of all the colonies. After suffering many reverses, the Belgians, Portuguese, and troops of the Union of South Africa under General Smuts, who were engaged in the task of wresting this territory from the kaiser, finally succeeded and forced the Germans to evacuate in May, 1917.

The Germans had placed a great deal of hope in the Boer rebellion which suffered a crushing defeat at the hands of General Botha's troops only a few short weeks after its outbreak. With the failure of the Boer uprising, the chances of the Germans for an ultimate victory went glimmering. Odds and opposition were too strongly against the Teuton, and the red-white-and-black empire in Africa was at last extinguished.

As early as August 29, 1914, German Samoa had been captured by the British and the government made prisoners and taken to the Fiji Islands. Next, the English took Herbertshöhe, in the Bismarck Archipelago, and September 13 destroyed the big radio station there. On the nineteenth of the same month, German New Guinea was occupied by the British.

It would appear that the French and English had taken over all remaining German territorial possessions, but not so. The Japs, it must be remembered, came into the world conflict and cut off the tentacles of the octopus-like Teuton in the East by staging fierce attacks on Kiaochau, principally near Tsingtau, during September, 1914. After a long siege the protectorate was evacuated November 7, 1914.

On October 8, the Japanese had taken the Island of Yap which belonged to Germany and is a member of the West Carolines. The city of Yap is the seat of government for the Caroline and Pelew islands. Yap now belongs to the United States as a coaling station in the Pacific and, as has often been jokingly remarked, is about the only thing of any value which the United States got from the war. Yap is an important strategical point. It has a population of about 8,000.

And so it came to pass that a great colonial dominion was finally wrested from the German grasp. After 30 years of steady development and advancement in the arts of colonization, the war snatched away rudely the results of German endeavor and left the Fatherland "childless." The proud colonial empire slipped away from the parent, piece by piece, like an island of quicksand—lost forever, except in the pages of our old schoolbooks.

Fairy Isle of the Blue Straits and Its Legends

Concluded from page 11

Born an Ottawa, with an Ojibway mother, by an alliance with the Potawatomies, Pontiac became chief of the three tribes. He was a wonderful personality and he had great executive ability. Afterward he was foully murdered by one of the Illinois tribe. The Ottawas later avenged his death, practically exterminating the Illini at Starved Rock.

As a part of the plan of the general uprising, the Indians invited the garrison at Mackinac to witness a game of ball, called "baggatiway," August 8, 1763. As all seemed friendly the invitation was accepted and during the afternoon the gates were left open. The ball was thrown within the inclosure, as though by mistake, but it was a prearranged signal, at which all the Indians rushed in, grabbing their tomahawks from the squaws who were standing about and had them concealed beneath their blankets. A general massacre ensued.

That soldier of fortune, Alexander Henry, escaped from the carnage and fled for his life, but was discovered and brought back, and as the Indians were becoming satiated, they were keeping him to be tortured later on, but that evening, before their plans could be consummated, Wawatam (or Wenniway) appeared at the council of Chief Minavavana, bearing rich gifts and begging that the life of Henry be spared to fill the place of his dead brother, Musinigon, recently slain in the wars with the English.

The request was granted and Wawatam took Henry to his own wigwam, where he kept him for several days, until a boat, coming through the Straits laden with supplies (including firewater) for the forts, and not knowing that the Indians held possession, was seized by them. Wawatam wished to celebrate with the rest of his tribe and he feared for Henry's safety, once they all got good and drunk, so, one evening at dusk, he hid Henry in a cave.

Henry was far too frightened to have slept much that night anyway, but, scared as he was, he noted the unusual hardness of his bed, and, in the morning, his peace of mind was still further upset, when, on looking around in the semi-darkness of his new lodging place, he discovered the cause of the extreme roughness of the floor of his new abode. It was strewn with human bones!

Some have thought that Indians of prehistoric times took refuge there from the Deluge. Others that the original inhabitants of the island might have fled to the cave before the invasion of the Hurons at the time of the Iroquois wars of 1650 and were there massacred. Or it may have been a burial vault. It has even been advanced that the cave was the one-time receptacle for the bones of prisoners who had been sacrificed and devoured at war feasts, but no one really knows the wherefore of Skull Cave.

There is an Indian legend about the cave, which is, that Chief Kenu sat within the cave awaiting the coming of Michabou, the Great Spirit, to answer his prayer. He had brought the clay with which, by Michabou's help, he hoped to make better peace pipes for his contentious people. As he sat waiting, one of the skeletons rose and said, in a hollow voice: "Silver is under thy feet. Take of it with thy clay and make pipes and thy people shall find the Spirit of Peace wherever their smoke shall arise." Kenu obeyed and the apparition blew upon them filling them with the peace-making power. Thereafter, the influence of the united and peace-loving tribe of Kenu was felt far and wide.

After the celebration was all over and the firewater had been drunk up, Wawatam came back to the cave and got Henry and took him to his lodge again where the winter was spent most happily, the paleface learning to love his Indian brother and family, and it was with genuine regret that he finally parted from them in the spring when opportunity offered to leave the island in the canoe of Madame Cadotte, a daughter of the chief of the A-wous-ee clan of the Ojibways, but who had been married, according to the white settlers' customs, in the little old mission chapel, to Jean Batiste Cadotte, French governor of the fort at the Sault. Later Cadotte and Henry were to be partners in the fur trade.

Wawatam stood on the beach as Henry finally left with Madame Cadotte and her three boatsmen, and he besought the Kichi Manitou to take care of his White Brother Henry until they should meet again.

Poor, kindly Wawatam later became blind and was accidentally burned to death in his lodge at Ottawa Point.

The old Mission Church, oldest in the Northwest, was originally erected at St. Ignace, but was later removed and rebuilt, stick by stick, on its present site.

Not far from the Fairy Isle, the *Scorpion* and the *Tigress* once operated a blockade, during the British occupancy, and it was then that the islanders ate horse meat, and paid a dollar a loaf for bread.

On the north side a mounted cannon marks the spot where the British made their effective landing in 1812. Soon afterward they built a fort on the highest point on the island, 318 feet above Lake Huron and 168 feet above the American Fort Mackinac, naming it Fort George, after their king, George III. When the Americans took possession of Mackinac again they called this Fort Holmes, for Major Andrew Hunter Holmes, who was killed in the battle of Mackinac Island, August 4, 1814, while attempting to capture the fort from the British.

While the British held the fort a large blockhouse occupied the center of the inclosure, under which was stored ammunition. The inclosure was encircled by an embankment lined with sharp-pointed cedar poles, with pickets, much the same as the American fortifications. That old blockhouse was almost destroyed by the Americans using it as a target for practice from Fort Mackinac. Then the remaining timber was used as a barn at the foot of the hill below the fort. Later still, what material remained was carried back and Fort Holmes restored as first built, after much traveling.

Troops under Major Sinclair took possession, July 13, 1780, of Mackinac Island, for a consideration of 5,000 pounds, paid to the Indians. Afterward these same Indians showed signs of discontent with the arrangement, but a hastily summoned cannon from Detroit calmed them.

Above Arch Rock a seat conveniently placed gives opportunity for enjoying a wonderful marine view. This place is named for Jean Nicolet, said to have rested at that spot, and to have been the first white man to view the Straits when, in 1634, in a birch bark canoe, with three Indians, he made the trip from Three Rivers, Canada, to Green Bay, Wisconsin, via the Ottawa trail, Georgian Bay, Sault, Lake Huron and Michigan. He was Champlain's agent, sent to find the South Sea route and China, and to extend the French fur trade. In order to impress the Chinese, he took along "a damask robe, broidered with flowers," and this he wore at Green Bay, Wisconsin, at a meeting with the Winnebago Indians. He was afterward drowned in the St. Lawrence, near Sillery, in 1642, while bent on saving a friendly Indian from torture. No doubt Jean Nicolet felt, when he first viewed the Straits, what Miss Harriet Martineau so beautifully voiced at a later day: "It is comparable to nothing but what Noah must have seen the first bright morning after the Deluge."

It was Father Jacques Marquette who founded the first mission on the Straits of Mackinac, at St. Ignace, in 1671. He had come to Mackinac Island that spring from the LaPointe mission on Lake Superior, where he had succeeded Father Allouez in 1665, that mission being broken up when the Hurons and the Ottawas fled in the face of the fierce Sioux, to the island, and Père Marquette came with them. He found, however, that Father Dablon had been there the winter before, so he went on to St. Ignace and established that mission for both the Hurons and the Ottawas.

These good French priests labored unceasingly for the good of the Indians and while on their travels they made many discoveries and maps which have proved very valuable.

From the Michilimackinac base started forth Marquette and Joliet on their historic journey down the Mississippi, intent on finding the South Seas. When fully satisfied that only the Gulf of Mexico awaited them at the mouth of the Father of Waters, they returned, but next year the indomitable Marquette started forth again, the spirit of adventure still strong within him. Years of privation and hardship had told on him, however, and he died before he could return to the Straits. He was tenderly buried by the side of a stream by his devoted followers, who, two years later, returned, augmented by some thirty canoe loads of their brethren, and brought the body of their beloved leader home.

And here Père Marquette, from the little hill town of Laon, in France, truly a Great Spirit, a Manitou, sleeps 'neath the little Mission Church he helped to found, in Mishi-min-auk-in-ong, Land of the Great Spirits.

Soviet Gold—Does It Go to Wall St.—Or Not?

Concluded from page 10

would not remelt any gold the origin of which could not be traced, and ownership of which could not be proved. This ruling was based on the theory that Soviet gold was stolen gold, which it was, and our government refused to act as a fence for stolen property. Sweden was not so captious with the result that her mints were kept very busy. The second reason for this stop-over at Stockholm is quite as important. Everyone who has been to Stockholm has heard of a banker there by the name of Olaf Aschberg. Olaf was mentioned in the Sisson documents as the banker of Stockholm through whom Max Warburg & Company of Hamburg on behalf of the German Government gave Lenin and Trotsky-Brounstein six millions to finance the second revolution. He is now at the head of the State Bank of the Russian Soviet Republic recently started with a few quintilliards of paper rubles as capital. On April 10, 1922, the London *Post* states:

"A large gold consignment valued at 33,000,000 crowns recently arrived here from Reval. It was addressed to Svenska Ekonomibolagot, a concern whose name has been mentioned in connection with large credits to Russia, and which is run by a Swedish Jew, Aschberg, who, during the war, was a frequent speaker at Bolshevist meetings. Bank credits in America anyway are not always carried in the names of the actual owners." Now with respect to the telegram of Messrs. Kuhn, Loeb & Company, to Senator Borah and which was read into the *Congressional Record*. I did not mention the name of that banking firm in my speech of one month ago, but the name having been brought in, I accept the gage of battle. Let us see what there is on that. In looking up this matter of Soviet gold in Wall Street, I had access to one file in which there were numerous clippings made from the financial columns of the New York *Times* indicating that there had arrived at the port of New York shipments of gold from Stockholm and consigned to Kuhn, Loeb & Company, amounts ranging up to two and a half and three millions of dollars each. I started to tabulate them but the owner of the files assured me that he could not guarantee that the file was complete. You will find these short and extremely significant little articles in the financial section of the *Times* from day to day if you look for them. Surely there is no value in carrying a matter of common knowledge to such lengths of investigation. It is almost puerile . . . .

Senator Borah took occasion to ask these international bankers whom he has so often flayed in the Senate for his information. Why did he not go to some department of the Government of the United States for that evidence which he was apparently so anxious to obtain? I challenge him to do so. He dare not get the facts from official sources. I am quite sure that either Secretary Mellon, Secretary Hoover or Secretary Hughes will be glad to accommodate him. I would be very content to rest on their assertions.

I have but the kindliest feelings for Senator Borah, because I have watched his public career for several years as he has slipped farther and faster into the arms of world revolutionaries. I have long since come to the conclusion that there are political or perhaps business limitations which preclude statesmanlike vision or correct thinking. And it is now on account of that friendly feeling that I desire to point out to him that he is keeping mighty dubious company. For instance, I have here in my hand a copy of a paper called *The Worker* which styles itself the "organ of revolutionary working class expression." The issue is that of February 24. On the second page is an article with a scare head which announces that Senator Borah is to speak at the Lexington Opera House March 11 under the auspices of the World War Veterans, the Rev. John Haynes Holmes to act as chairman, and Jack Brador, national chairman of the World War Veterans, to be co-speaker with the Senator. The Senator should understand that the World War Veterans is the organization which is the mouthpiece for communism in this country among the veterans. The evidence was found in the seized documents of the Communist Convention at Bridgeman. Everyone knows the Bolshevik tendencies of the Rev. John Haynes Holmes. That meeting was held and Senator Borah spoke. Since that time, it has been established that the actions of Senator Borah have been so sympathetic with the Communist organization in this country that he was endorsed for the Presidency in the 1924 campaign by the Bridgeman convention and the facts were brought out a few days ago during the trial of William Z. Foster.

Then, too, I desire to give a friendly warning to Senator Borah on another account. I understand that he is packing his steamer trunk preparatory to a journey to Russia as a guest of the Soviet government. There is a danger in this. I do not speak of the danger of contamination for that period of his political degeneration has long since passed. It passed two years ago when he used all the influence at his command to defeat a Senatorial investigation into the radical activities of the Amalgamated Clothing Workers. There is no further danger of that kind. But I do speak of the laws of the United States, duly spread on the statute books by act of Congress. The Logan Act is now nearly 100 years old, and was enacted when a situation existed with reference to France which parallels with startling fidelity the condition which exists today relative to Russia. This act provides for the arrest and punishment of any citizen or officeholder of the United States who enters into negotiations with any foreign government without the due authority from the executive branches of the government to which is committed by law functions of that kind. It was an expression of anxious concern at the time of its passage to obviate the dangers which George Washington spoke of in his Farewell Address against the incursions of alien influence into our body politic. I advise Senator Borah to be careful. Public opinion in this country is rapidly being educated. Before he returns, it may crystallize sufficiently so that he may become the object of the provisions of this law. Why the Logan Act was not enforced in the case of Senator France, I have been unable to figure out, except that he nominally belongs to the same political party which is in authority in Washington. But party affiliations sometimes fail in moments of distress, and thus again I take occasion to call the Senator's attention to something which he may have overlooked. It really is a very serious thing. I should hate to see him even in an American jail, a victim of his own enthusiasms.

But aside from all this, in its broadest sense, we have watched this conspiracy, to dominate the world rise, flourish and bring horror, misery and suffering to vast numbers of people. I have just received word through European sources of information which I consider reliable that the last Congress of the Third Internationale has appropriated half a million dollars for the propaganda which will have as its object the overthrow of this government by violence. Perhaps there is some connection between this and the press reports to the effect that the former Russian "Ambassador" Ludwig C. A. K. Martins and his secretary, Gregory Weinstein, are planning to visit the United States—perhaps to see that the money is properly spent. I assume that some of this gold in Wall Street we have been talking about will be used. It is handy enough, anyway. That does not take into account money diverted from famine relief funds and local contributions from workingmen, bankers and others. Will someone please advise me where there is an equal amount available for the maintenance of this government through educative propaganda? I'd like to feel the power of its influence.

And as we have watched the meteoric rise of world revolution from the gutters and dregs of Europe, we gradually come to the conclusion, which I believe is entirely warranted by the facts, that the downfall and continued crushing of the Russian people by an irresponsible minority into the mud of despair, has been one of the biggest looting propositions that the world has ever seen. Loot! Loot! Loot! on every hand and everywhere.

The Manless Ship—Controlled by Radio

Experiments Carried Out by Navy with "Iowa" Successful

By S. R. WINTERS

"Official photographs U. S. Navy"
Iowa under radio control.

A BATTLESHIP steaming ahead, without a person aboard, and in the absence of visible means of control, was the strange and almost unbelievable spectacle viewed at the joint maneuvers of the Atlantic and Pacific fleets of the United States Navy Department off the coast of the Panama Canal Zone, in March, 1923. The weird tales of vessels plying the oceans without guide or chart, fanciful myths dating back to the Roman galleys, have been translated into stern reality. The wonderful wireless waves have made of the legendary manless battleship an accomplished fact.

The battleship *Iowa*, a veteran seagoing craft of the Spanish-American War, was equipped with radio apparatus and plied its way through the waters without any crew or personnel aboard. Another steamship, several miles distant, controlled and guided the course of the manless *Iowa* by means of wireless equipment. This apparatus consisted of a standard device for transmitting electric waves, the entire operation of the *Iowa* being subject to remote control. The crewless vessel was started, its direction steered, and its operating machinery stopped solely by use of the wireless waves. Moreover, the obsolete battleship *Iowa* became a moving target, the modern battleship *Mississippi* directing the fire of its giant rifles in the direction of the radio-controlled ship.

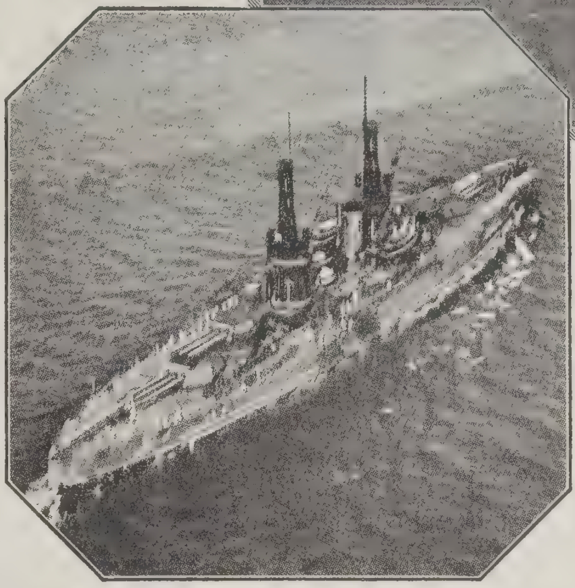
The old battleship *Iowa* was modified in some particulars before it assumed the rôle of a modern miracle. Its power plant underwent extensive alterations as a means of insuring the operation of the propelling machinery for a considerable period of time without requiring personal attention. The boilers were transformed from coal-burning into oil-consuming power-supplying units. Also automatic devices were installed for feeding the fuel to the burners and supplying water to the boilers. The wireless outfit on this crewless battleship consisted of an aerial or antenna for the reception of wireless signals from the distant controlling vessel. The radio signals were converted into a form for the operation of the electrical devices, which control the steering gear and throttle of the engines of the battleship, by use of specially designed wireless receivers, amplifiers, relays, and other units used in the reception of radio communications.

When everything was in readiness for the starting of the manless ship on its epochal cruise, the main engines were started and then left functioning very slowly. The vessel was forthwith abandoned, with not a person on board, and its control delegated to an officer in charge of another vessel miles removed from the *Iowa*. The first wireless signal transmitted by the controlling battleship was intercepted by the antenna on the *Iowa* and received by the radio apparatus located below the deck of the craft. The wireless signal was then amplified by vacuum tubes, similar to those used in thousands of radio-receiving sets throughout the United States. The amplified signal caused the functioning of an extremely sensitive relay or switch, which, in turn, operated a larger relay. The latter closed an electrical circuit which operated an electrically controlled pneumatic valve. When the latter opened, it admitted compressed air to the throttle control of the main engines of the battleship, which action caused the throttle to open and the *Iowa* steamed ahead at full speed.

The large relay or switch also operates a device described in electrical terms as a commutator, which in reality is a special electric switch having control of the steering mechanism. The commutator is the mechanical brains of the battleship *Iowa*. This device receives the wireless signals, interprets them, and passes them on directly to the electric motor controlling the steering engines. By means of the mechanical brains, the officer on the control battleship was enabled to steer the *Iowa* to either starboard or port, or to put the gyro-compass in control and maintain a steady course.

The gyro-compass is another novel installation on the world's only radio-controlled battleship. This device permits of automatic steering of the vessel. This compass is electrically connected to the control panel of the electric motor on the steering gear, thus making it possible for guiding the ship along any course. The steering apparatus on the *Iowa* consists of a standard steam-engine-driven rudder gear, the throttle valve of the engine being geared to a small electric motor. The commutator, or electric brains, of this battleship is connected to the control panel of this motor and is thus enabled to operate the electric motor, which, in turn, causes the steam engine to operate the rudder to either starboard or port, according to the dictates of the officer on the controlling vessel.

Suppose it is desirable to stop this crewless seagoing craft when steaming at full speed? The officer in charge of the controlling vessel merely transmits a wireless signal of 10 seconds' duration. This long radio signal serves to operate a special relay or switch which opens the circuit on an electrically controlled pneumatic valve. This shuts off the fuel-oil and feed-water pumps, thus suspending the operation of the power plant. Obviously, then, the radio-controlled battleship comes to a standstill. Furthermore, if the wireless receiving equipment on this ship should become inoperative for a considerable length of time a safety device is brought into force. This consists of a time clock which automatically suspends the operation of all mechanical devices in the event that the radio-receiving apparatus refuses to function.



The battleship *Mississippi*, ten miles away from the radio-controlled *Iowa*, directed its gunnery upon this obsolete battleship, a survivor of the Spanish-American War.

The wireless instruments and amplifying electron tubes employed on this wonderworking battleship are of the type used for other purposes in the United States Navy Department. The antiquated battleship *Iowa* when linked with that modern wonder, radio, became a twentieth century Flying Dutchman at the maneuvers of the Pacific and Atlantic fleets off the coast of the Panama Canal Zone recently. Under invisible motive power the *Iowa*, without a person aboard, maneuvered back and forth, in loops, curves, and diagonal dashes, while 10 miles away the battleship *Mississippi* was directing its gunnery practice on this relic of the Spanish-American War.

The gunners on the battleship *Mississippi* used the radio-controlled *Iowa* as a target for discharging ammunition from three forms of gunnery—5-inch guns, 14-inch rifles, and 14-inch guns. The critical test had for its objective the determination of the accuracy of the gunners when the battleship, guided by wireless waves, was making a full swing to port or starboard. The fourth and final bombing test was at a range that made it impossible for the gunners to view their target, and it was a gunnery practice that brought into action aircraft as a means of spotting indirect gunnery fire.

The battleship *Iowa* was surrounded by certain safeguards from complete destruction in the recent tests, despite its position as an open-range target. The gunnery practice involved the use of thin-skinned and extremely sensitive shells, manufactured during the final struggles of the World War for ammunition of the naval gunners in France. These shells explode at the slightest shock, and for that reason they were employed in bombarding the protective armor of the *Iowa*. Thus, a minimum damage was inflicted upon the hull of the battleship.

Now, thanks to inventive genius, battleships, torpedoes, automobiles and even trains may be started and controlled by radio. In all these wonderworking feats, however, the wireless waves do not supply the motive power for operating the battleship or train—the electric waves merely actuating certain throttles or levers which cause the engines to begin functioning. Recently, a freight train in Pittsburgh was started by radio and ran for some distance in the absence of local control. Of course, in obedience to law, an engineer was aboard but kept his hand from the throttle. In reality, the operator at the radio-transmitting station was in control of the throttle of the locomotive engine for the distance over which the freight train operated with the engineer keeping hands off. However, the wonderful wireless waves merely supplied energy enough for actuating the lever that opened the throttle to the locomotive engine. Similarly, in the radio-controlled battleship, the impulses of radio energy only serve to operate the throttle valves to the main engines—wonderful accomplishment that it is.

Weird Art of Great Benin Savagery a Mystery

Concluded from page 6

carved on figures on elephant tusks, which were placed atop the bronze likeness of the king on the sacrificial altar. On two such tusk figures appear crosses hung from chains about their necks. "The occurrence of the Christian symbol in the costume of these two figures," says Mr. Hall, "may perhaps find its explanation in conditions implied by the circumstances of the native tradition concerning the workers in bronze. Ahamangiwa's pupils would naturally be chosen from among Bini craftsmen who were already practiced in sculpture; the new master must have been a Christian, and was probably closely associated with the Portuguese missionaries, if he was not one of them. His pupils would thus be directly subject to Christian influences and likely to adopt Christian emblems for their own use."

"There can be little doubt," he adds, "that the Negro kingdoms of West Africa owed certain cultural features to contact by way of the trade routes leading north and east with the civilized parts of the continent; but that the art of casting bronze by the cire-perdue process was known to the Bini before their contact with the Portuguese in the late fifteenth and early sixteenth centuries, cannot at present be demonstrated. In view of the part unquestionably played by the Portuguese in Bini history 400 years ago, in view also of the fact that the only marks upon the bronzes themselves which bear unequivocal witness to definite foreign influences are the figures of Europeans of that period, and having regard to the result of the analysis of the metal, it is clear that the burden of proof of an origin other than Portuguese for metal working as a fine art in West Africa rests upon those who dispute the Portuguese claims."

When that influence was withdrawn the art of Benin began to degenerate. At the time the city was taken by the British virtually all the examples were dispersed, the largest and best of them going to British museums. "The brief period during which impressive products of artistic metal workers were turned out in Benin is, it seems certain, an interpolated great age, so to call it," says Mr. Hall, "appearing abruptly and passing through a rapid degeneration to extinction. The products of the brass workers on the west coast of the present day have little in common with such fine work as is represented even in an already degenerate specimen like either of the two large heads in the middle of the row on the altar." Prior to the introduction of European influence, however, the natives had been wood carvers, and had done work in ivory. In attempting to continue bronze work they applied the methods of their own technique, returning to what Mr. Hall calls the old stylistic treatment of salient features of the face which the less plastic medium in which they were accustomed to work had forced upon them.

The town of Benin was accidentally set afire on the third day of the British occupation, which was made to punish the massacre of the members of a peaceful mission to the king. Nothing is left of it now but modern native huts and some ancient ruins, stripped of all examples of the extinct art. At the time the British entered many fine objects had been removed and scattered about the world. When Benin was in its glory it was the custom to place, on the roofs of most of the buildings in the royal compound, great snakes of brass or bronze, lying heads downward above the doors. Only one of those was in place when the British arrived. The museum collection includes a huge brass snake head. The snake was a powerful juju, or fetish.

"Creative art in Benin," says Dr. Gordon, "fulfilled its greatest tasks in connection with fetish worship, which made the chief demand on the artist's resources and furnished the most powerful incentive to creative effort. In that school the artists of Benin acquired a knowledge and skill that appear to have been extended to personal and domestic uses. The themes employed in personal ornaments, plaques and utensils, true to their traditions, are apt to be reminiscent of the fetish and to point in the direction of magic and the supernatural."

URBANA ILL

BRIEFLY TOLD

Farmers of Northern Wisconsin are mixing honey and water and using the preparation as an anti-freezing agent in the radiators of their automobiles. Ten pounds of honey with an equal amount of water will last through the winter and the solution is effective even at a temperature as low as 20 degrees below zero.

A flock of Rocky Mountain goats are allowed to roam about the buildings at the naval powder factory at Indian Head, Maryland. The goats devour the dead leaves and other inflammable rubbish, thereby protecting the powder house from fire.

Blueberries seven-eighths of an inch thick have been produced at the United States Department of Agriculture testing plantation at Whitesbog, New Jersey.

The will of Stuyvesant Fish makes three children equal beneficiaries in the estate which amounts to about $2,500,000. A sentence in the will read as follows: "Having observed and always believed charitable bequests afford the testator a means of gratifying his vanity at the expense of his heirs, I make none."

The *Commoner*, a weekly publication printed in Lincoln, Nebraska, by William Jennings Bryan, has been discontinued. The publication was 20 years old.

A new cable, the largest ever laid in the Atlantic, will be laid by August 1, between New York and London. The route will be from New York to Nova Scotia, a distance of 1,000 miles. From Nova Scotia it will run to the Azores, approximately 1,750 miles. There it will connect with a cable already laid to Europe.

The Bow River in Alberta is so named because wood well suited for bows grows on its banks.

German buyers are boycotting the world-famed costumiers of Paris. The French designers admit that, since the occupation of the Ruhr by French troops, the import of French models by Germany has dwindled. Many Berlin firms are producing their own fashions which they present to the buyers by means of skillful mannequins.

At Tell-Nebi-Mendhi, in Syria, a large city of the Hittites, and at Djibrail, the Phoenician Byblos, are excavated fragments of large buildings and mummies which prove the presence of Egyptians in Syria during the third dynasty. These Egyptian colonists exported from there valuable varieties of wood.

Many Japanese are going to South America because of the American prejudice against them. The press of Japan is urging them to take advantage of the lenient immigration laws of the southern countries.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

A slogan of the Zionist movement is: "Lead the people without a country to the country without a people."

In the British Isles the buzzard lays two eggs, but never more than one bird is raised, as the incubation of the egg commences from the moment it is laid and the first bird gets the lion's share of the food brought home. When about four days old it launches a violent attack upon its companion and kills it.

There are more than 800 distinct kinds of birds of 69 families in the United States.

Farming schools for women and girls are now operating in Germany. The pupils are taught the household and other duties which are the share of women on farms.

The Boers in South Africa have what they call "dance down" parties. These dances start some time in the forenoon and last until long after midnight. The couple which dances longest without taking any rest is declared to have "danced down" the others.

The movement from the farm to the city last year is estimated by the Department of Agriculture to have been approximately 2,000,000 persons.

In Austria paper money is now counted by weight. A money market rate in a Vienna paper quotes: "Kronen: 10,000 kilogram........0.35—0.37."

Dr. S. K. Mardis, head of the rural education of Ohio State University, at Columbus, said: "No person, either native or foreign-born, should be permitted to vote until able not only to read and to write the English language intelligently, but until they have a well-grounded knowledge of our government and a patriotic conception of the true spirit of the free institutions of America."

Since prohibition became effective in the United States exports of Irish and Scotch whisky from Great Britain to various West Indian islands off the American coast and to Mexico has increased 2,000 per cent, according to figures compiled by the Commerce Department.

Rubber is now being transported to this country from the East Indies in the form of latex, instead of in the blocks and sheets known to the trade since the beginning of its history. Tank cars for latex will soon be a familiar sight on the railroads. Latex is the white sap of the rubber tree from which rubber is made. By the use of ammonia the product is handled without risk of hardening.

During the first week of each New Year one can see in the older parts of the Japanese cities groups of men and women in a praying attitude, waiting for the rising of the New Year's sun. This religious ceremony is called the Hatsu-Hinode.

The Mexican Government considers dictionaries as advertising matter and levies an import duty on them.

The Temple of the Goddess of Mercy at Asakusa, Japan, has a yearly house cleaning. Buddhist priests clad in gray and using brooms of fresh bamboo leaves clean the old temple and dust the idols. These brooms are afterward burned in the "Holy Fire of Invocation" which also chases away evil spirits. The Asakusa temple dates from the thirteenth century.

President Obregon issued two presidential proclamations recently which decreed a ten-year absolute closed season for the rapidly disappearing mountain sheep and pronghorned antelope of the Republic of Mexico.

Aristotle, the great Greek philosopher, who lived more than 2,000 years ago, said in his "Rhetorica" (II.-12) the following about the young people of his time: "Their faults are nearly all errors of exaggeration. They overdo in cases of love and in all other things. They imagine that they know everything, and stubbornly stand on their point. They like to crack jokes for joking is the bad-manneredness of the well mannered."

Washington! Wistful, Wasted and Waiting

Planted and Told to Grow, Capital Has Had Hand-raised Existence

By BURTON KLINE

ONE of these days Washington may yet become the capital of our country. In a moment this remark will shed a bit of its apparent flippancy. Washington may become a capital as New York, Chicago, San Francisco are capitals, lacking only the presence of government; or as London, Paris, Rome, Vienna, Berlin are capitals—not an artificially created center of government, but the heart of a people's life, the seat of its fashion, its finance, its art.

Nobody built New York; it built itself. So did Chicago and San Francisco, and all these other great places. As they grew in obedience to forces of Nature, nothing could have stopped their growth. On the site of every one of them geography offered to human needs a natural situation for defense, or a harbor or river for commerce, and the city that arose was inevitable. Because it was safe, government rested there. About its waters squatted shipping and trade. Drawn by the glitter of wealth and the promise of opportunity, population flocked in. Fashion shaped itself about the courts of kings, or about magnates and their money. As men accumulated means and the desire to sport with means, art appeared, and all the play-efforts of the mind. A capital had been made—every capital, except Washington!

We like to think of our fathers as men of a flawless wisdom. To us everything they wrote into history is sacrosanct. We try to shape every important thing we do after the pattern they left us. But they committed at least one egregious folly. They wrote into our history a lapse of judgment that must exert on our national life a constant and permanent damaging influence, that must be of incalculable force, subtle as it is. In a swamp beside a sluggish river, in a remote corner of the country, where nothing was to invite the founding or foster the growth of a city, they firmly planted Washington, by fiat, and told it to grow.

Hamilton Responsible

IN EVERY other matter their foresight was next to miraculous. Perhaps the enormous westward development of the States was beyond any human prevision then. But not even judgment seems to have entered into the choice of a spot for the nation's capital. Washington is the outcome of a political squabble—the almost haphazard thought of a man in search of any handy compromise.

Somebody of that day wanted the capital for Albany, and put up a stiff case for it. Jefferson argued as stoutly for some point in the South. New York and Philadelphia revived their claims. The States were still jealous and suspicious of each other, and the wrangle took a serious twist, when Hamilton stepped in with his happy idea of putting the capital—in none of these places! On neutral ground, in territory separate to itself, the seat of government, after its wanderings, should come to rest for all time. The map showed a spot on the Potomac to be, if not geographically the center, then at least the focal point of the activities of the country, as it was at the time. The Potomac was a beautiful river, and the site chosen upon it paid the Father of us all the compliment of being but seventeen miles from Mount Vernon.

So Washington was literally put out in the country and encouraged to grow. Once the wrong site had been selected, foresight got busy enough. Under the eye of General Washington himself, L'Enfant drew up for the city that was to be a plan that would have set it to vying with any other capital in the world—if it had grown! In the furtherance of that plan a generous people has stinted nothing, has lavished everything it could provide. Nothing has been niggardly with Washington—nothing but the forces essential to the upbuilding of any great city, and especially a capital—the forces of old Mother Nature. Washington has always been hand-raised. It had to be. Until recent days it was bottle-fed—openly. It still is, furtively. Meanwhile the rest of the country has grown completely away from its capital and left it a suburb. Almost Washington has been left out of the United States.

Friendliness of a Village

IT IS not hyperbole to say this. There isn't a trace of exaggeration in the statement. Live there a year and you acquire a sense of it. The feeling of remoteness grows with your physical approach to the place. One naturally supposes a capital to attract to its neighborhood a surging of people. The approach to Washington, from any direction, is through a thin string of hamlets, some of them the least handsome and the most lacking in thrift of any in the country. These are scattered over a landscape nowhere the loveliest, and in stretches the least lovely, the dreariest we have. No other capital of a great people is circled with environs so shabby. Soon enough the city itself presents you with its beauty—and soon enough with more of that sense of remoteness. You well enough know where you are—in the capital city of the United States. Everywhere stand tokens of government—tokens grandiose, impressive, moving—to remind you of where you are. But they are the only reminders.

You are in a city at once the loveliest, and the laziest; the most entrancing, and the most annoying—and amusing. Its public manners are as flawless as we take our fathers to have been. Buy a newspaper twice at the same stand, and on your third visit the dealer will invite your views as to the beauty—or the rottenness—of the weather, as the case may be; and he may already have learned your name and the place you hail from. Your experience will be the same with the cigar vendor, the butcher, the baker and candlestick maker.

Washington is a cosmopolis, and a village. In the faces of the government clerks, as they go to their duties in the morning, you will read the feeling they have of the national importance of their work. Think what you please about the expense of government, but nowhere in America shall you find folk with so exalted a sense and love of duty. Pride of fidelity is their chief reward, heaven knows! Yet they cheerfully accept their meager salaries and decline handsome offers from the outside world—because they love their Washington. But talk to them, and you are instantly on Main Street. Mr. Sinclair Lewis lives in Washington. It is possible that he got as many of his types there as he did in Minnesota!

"From the outside world"—the words are used advisedly. Hard times may be gripping the rest of the country: Washington serenely goes its way untouched. Government will certainly be the last thing, the least likely thing, to totter and fail. And no other business, no independent business, is permitted. That fact alone has a profound effect on the character of our capital. When the fathers deliberately ruled out of Washington all gross manufacture and commerce, they definitely limited the size of their city, and as definitely crippled its spirit. It lacks the independent wealth, the private enterprise, that builds liberally—business blocks, theaters, all the appanages of a metropolis. Hence Pennsylvania Avenue, as it now is! Hence F street, the smart shopping center, dispensing precious wares to the élite of the world, in buildings raised in the 60's or 70's, and never afterward more than slightly bettered. Hence the absence of an opera, a symphony hall, or suitable theaters. In summer, Nature provides the open air for the concerts of the splendid Marines Band—in winter Washington provides a barracks! It is typical.

So, by its wilful detachment, as by a number of forces, Washington is set apart and given its character of a village, complete, contented, sufficient unto itself, draped about government trappings, most of them gorgeous and imposing, and all of them wasted. The railroad station that welcomes your very arrival awes you as one of the truly magnificent expressions of man's imagination—and except for the occasional notable or band of tourists, its arches echo to nothing but the thin little daily trickle of shoppers from Bladensburg, Hyattsville, or Fairfax Co't House. Outside the station stands Lorado Taft's "Columbus," appropriately gazing at the dome of the Capitol, the symbol of everything that has followed upon his adventurous voyage—and the few people who pass seldom give him a look, save on a hot summer's day when boys frisk in the pool at his feet. From the point of arrival, wide avenues, long vistas, parks wooded with trees from all over the world and studded with statues—the newer ones really noble works of art—invite the stranger to his own tour of discovery. And the prizes that await him! He is a poor American who can pass the White House or the Capitol for the first time without a surge of emotion—or the Lincoln Memorial, the statues to Grant and Sherman, and many another, without a thrill of pride. All the appurtenances to a capital are there—and it is empty. America doesn't come to its capital.

Of, But Not in America

IT MAY take you a year to learn that Washington may be of, but it is not in America. Yet to be utterly convinced of the fact you have only to wander into the galleries of Congress on any day and listen to the debate. There is another remark that is by no means flippant. It is of a penetrating truth. Members of Congress appear to be the first, when they should be the last, to acquire that sense of remoteness. They can't help it. There lies the curious influence for hurt that Washington's remoteness exerts on our national life.

A Senator or Congressman may feel fully persuaded that he knows every heartbeat of his constituents, that he has his finger every moment on the pulse of the American people—to whom he pays such lavish court in his every speech. It isn't so, it can't be so. He may receive bales of letters and dozens of telegrams daily. It isn't the same as the look of the eye, the grip of the hand, the spoken word of the living person. And the living American gets to his Washington only seldom and in mighty small numbers. We and our government dwell far apart—too far apart. There is another sense that you acquire—not of remoteness only, but of the effects of remoteness. When the chief of its effects are the windy debates and the lumbering methods of government, the remoteness takes on a serious cast, and the wisdom of pitching the capital where it is may be questioned soberly enough.

Who supposes for a minute that our honorable representatives would think of indulging themselves in their rambling and aimless oratory if governing went on with us as it does in other countries—that is, in the heart of the land, in some great and typical city, with the common sense of the country beating in upon the scene of legislation? Being off by itself, Washington feels free to talk. On one evening you may meet a Senator at dinner, and find him a brilliant wit, a serious thinker, swift in judgment, a personage delightful, a man who impresses with his flood of common sense. On the next afternoon you may sit in the gallery and hear that same personage putting forth without a blush the most solemn bunk, as far from the point of debate as the Greece and Rome that he must mention at least once to remain on good terms with his pride of service! And they all do it. Any page of the *Congressional Record* will bear this out. What is the reason? you ask yourself. Washington's remoteness is the reason.

One of the reasons. Another is its climate. And again the apparently smart saying happens to be the deadly truth. On a morning in spring, when those Japanese cherry trees are in blossom along the speedway and about the Tidal Basin, Washington is, by look and by everything else that nobly titillates the senses, an earthly paradise. In midsummer it is hell. In either season that climate induces a delicious but insidious languor. It relaxes every fiber in the being—but in especial the fibers of the tongue! It is why Washington is also the capital of gossip. In the wintertime it is too sloppy, in the spring too delightful, in summer too devilish hot, to stir about. Those forbidding distances further discourage movement. Nothing is left but to sit where it is pleasant, and talk. For generations that has been the Washington habit. The newspaper correspondents get the habit. Big news is all about them, to be had for the asking, but they like better to sit about hotel lobbies or in the offices of Congressmen, and put on the wire, "It is rumored—," or "A well-founded story has it—," and then follows gossip, instead. It's a dull week when it has not been "rumored" that some Cabinet member, who has no intention whatever of resigning, is about to resign.

The Sway of Climate

QUITE as a matter of course the tongues of the lawmakers are affected by that Washington climate. Every now and then the complaint goes over the country that the South is again, or always, in the saddle. It is true—and why? Because those salamanders from the South thrive in a blistering heat that lays low the North's representatives. It isn't the South that's in the saddle, it's Climate.

That same climate, inducing the same tendency to talk, does a better service when it steps outside of government circles, lays its soothing spell over the town, and tones life down to a delightful quietude. Nobody rushes in Washington. For motors the speed limit is eighteen miles. Not even the taxis violate the ordinance. As for the street cars, they never come within ten miles of violation. On one of those days when every vehicle for hire in the whole city seems to have been hired, it may easily cost the stranger thirty-five minutes of his time to get by street car from the Treasury to the Union Station. They move with impressive deliberateness, those street cars. For any one in a hurry, Washington can be exasperating, but never more so than in those street cars—unless it be in those traps for the unwary new motorist, the Circles.

Being a Washingtonian, the street car motorman naturally knows most of the population. "Ding-ding!" he gets the conductor's bell, at some stop; but does he start his car? Not yet. His eye has caught the figure of some acquaintance on the corner. "My, my!" runs in his mind, "if there isn't Jim Smith. Last time I saw Jim was—let me see. Six months ago. Got a new suit on, too. Wonder how he does it! On his salary! As if I didn't know what he—and everybody—gets!" And so, his rumination finished, the motorman at length consents to run on to the next stop, where he is apt to repeat the process. Washington may be a city of cliques and levels of society, sharply bounded and mutually impenetrable. But within themselves the cliques are chummy. You may contrive to be lonely in Washington, as in Philadelphia—but not after you are acquainted.

As in Philadelphia, the members of Washington families are interested in each other, they stick together, they entertain each other, and other families, and the stranger. In the evening a Washington man actually goes home. He wants to. Bother the theater, when there will be dining or visiting at home. When the American fireside has everywhere else died to ashes, it will still survive in Washington and Philadelphia. Both cities are literally "at home." Provincial, you may call it, at first, and say so openly—at your peril! Malign his city to a Washingtonian, and hear what he has to say. If he does not shut you up, his cordial hospitality will shame you to silence. In the beginning Washington may put you out of patience; then its charm overcomes your every objection. In the end it will get you. And you will know why Washington may yet become a capital.

Few Good Roads Out

IT MAY be driven inward upon itself—by its very isolation. News from the outer world trickles lazily in, and is read with indifference. The place boasts no feverish excitements, and scorns them. For the motorist there are perhaps two passable drives into Maryland, and two or three others into Virginia. The other roads are literally "rattling" good, and no one ventures on to them unless driven by business reasons. Who drives within Washington itself surely imperils at least the paint on his car, and perhaps the integrity of his own skin. Every corner is a risk, and the thousand and one cops necessary to the regulation of such a traffic the city cannot afford. Not the finest car, neither landau nor limousine, is safe from the flying delivery wagons, every one of them driven on the motto, "Looking out is for the other fellow." It's a common enough sight to see some handsome vehicle, of a proud make, limping home with twisted guards and dented sides.

As for those Circles—Dupont, and Scott, and Thomas, and the rest—with six or eight streets radiating from the statue at their center, they will ten times trap every motor-

Shall We Have an American Opera?

Will Foreigners Who Control Our Operatic Stage and Our Musical Life Be Driven Out and Permit America to Express Her Own Music and Songs?

By HARRY H. DUNN

WHY HAVE WE NO AMERICAN OPERA? Why do American composers, who have written scores of operatic productions, have to look to music festivals, orchestra concerts, pageants, and similar local affairs for the opportunity to present the music and the songs of America to the American people?

Why is not America allowed to express herself in the song-stories of her own history, written by her own sons and daughters, instead of catering to Germany, France, Italy, Spain, and other countries, and being compelled to accept their operas, if we Americans want to hear opera?

The answer, made by American composers who have been trying for years to have one, even one, American opera produced, is:

"Foreigners, and foreigners only, are on guard at our opera houses. They are forcing down our throats or into our ears only the operas of foreign countries, because they do not want the great deeds, the inspiring periods, of American history repeated to Americans."

Above—WILLIAM J. M'COY, master of orchestration for the celebrated Bohemian Club, of San Francisco, and one of the most successful of American composers, who has been for years trying to get even a hearing for one of his own operas, written around an American theme, from the foreigners who control all the operatic productions in America. Circle—GILBERT MOYLE, at work on his new American opera, "The Traitor," in his home in Berkeley, California. At left—CHARLES WAKEFIELD CADMAN, American composer, who, after several years, succeeded in getting the foreign element which controls opera in the United States to present one of his American operas. It was a success, but was allowed to drop out to make room for the work of foreign composers.

For more than a score of years, American composers have been endeavoring to have an American opera—any American opera, not necessarily any particular one by any particular American, but any opera which is American in theme, music, words and composition—produced in American opera houses, but with only temporary success. A few years ago, Charles Wakefield Cadman, one of the leading composers of America, with dozens of worth-while songs to his credit, the man who has written virtually all the songs of the American Indian that we have, obtained production for one opera of several he has written. It was an American opera, written on an American Indian theme. It was a success when it was produced. But the producers, foreigners all, forgot it, as soon as it had been given a showing, to make room for a foreign production.

Every now and again some impresario—foreign by birth, training, sympathies—brazenly announces a "contest for an American opera." American composers, though deceived time and time again, always enter these contests, giving to them the best they have in words, music, plot and stage setting. When the operatic scores are all in, the producer selects, not the best, but the worst, for presentation. When it fails, as it is foredoomed to fail because it is the poorest of probably one hundred entries, this producer from Rome or Jerusalem, sadly shaking his un-American head, makes this excuse:

"There you are. You talk of American opera, and when I try to give you one, this is the result, such a bad result that you won't have it."

The ninety-nine untried, and unread, operas are returned to their American writers, and what might be a serious American undertaking is turned into a fiasco by the duplicity of the foreigners to whom we have intrusted our musical life.

This sounds like the dream of a disappointed composer, but the writer knows of seven different occasions on which exactly this process has been gone through with, this deceit "put over" on Americans by foreign operatic producers in America. So bad is the situation, so hopeless the outlook for American composers and librettists seeking even the *opportunity* for production of an American opera, that American composers, almost without exception, are filing their operatic compositions, in the hope that, sooner or later, possibly not for the next half-century, but some day, Americans will take back from the Jew and the Italian control of music in America. Men like William J. McCoy, master of orchestration for the celebrated Bohemian Club, of San Francisco, and responsible for years for the purely American music which is presented each year with the Bohemian Grove Play, and who has written no less than 12 operas on American themes, have been unable to get a chance to present to the people of their own country their operatic compositions.

Cadman, McCoy, Sabin, and other American composers, meanwhile are obtaining presentations of parts of their operas, overtures, arias, duets, and similar sections of the whole composition, at music festivals, in "music weeks," and similar local and limited affairs. Through these they believe they are slowly building up a demand for American opera, which eventually will crystallize into a demand by the music-loving public for the production of the entire operas, not necessarily in New York, nor yet in Chicago, but in other cities scattered throughout the country, where musical entertainment is sought for the joy of hearing less than for an opportunity to display diamonds.

There is some hope that eventually Americans will come into direction of America's music. That hope grows stronger each year as it becomes more and more apparent that the demand for foreign opera, delivered by foreign singers under foreign standards, is limited to New York and, to a lesser degree, to Chicago. There is more hope in the fact that tours of foreign-directed grand opera companies into the states west of the Mississippi River for the past several years have resulted in both financial and artistic failures. There is still greater hope in the recent successes of the revivals of light operas in English, because these successes show that there is a genuine demand for the operatic form of entertainment, presented in the language of the country and built around themes which are more or less American in spirit, such, especially, as the Gilbert and Sullivan productions.

There should be no underestimating, however, of the strength of the foreign control of our musical stage, nor of the tenacity with which the foreigners holding that control will battle to retain it. An example of this was the recent ousting of Mary Garden from direction of the Chicago aggregation of foreign "song-birds," for whatever may be said of the sturdy Mary, it must be admitted that her ways of thinking and her methods of action are strictly and strongly American.

In the Far West, there is a tendency this year to devote more time to American operas, and to present larger fragments of these American operas to the people through the media of concerts, festivals, pageants and similar homemade productions. The annual music festival, in the Greek Theater of the University of California, at Berkeley, which is becoming the crowning event of musical life on the Pacific Coast, is presenting each year as large parts as possible from American operas, though its list of artists is limited to those who are bona fide residents of California. Other states on the Pacific Coast, however, are preparing similar music festivals, at which the works of their own composers will be heard, and there is a bright prospect that, by this means, a demand for, and an appreciation of, American opera may be established.

Librettists likewise find themselves confronted with an apparently insurmountable barrier whenever they write the book of an American opera and seek to have it set to music by any well-known composer. The foreigners, in control of the operatic stage, will "accept" the libretto, and inform the writer of it that they will obtain for him the services of a composer who is capable of doing justice to the words. There the matter ends; the composer is never found; in fact, the foreign producer in America makes no effort to find him, and, eventually, the librettist is glad to get back his book, without any music or any probability of production. One of these librettists is Gilbert Moyle, of Berkeley, with the books of two American operas to his credit, and a third just completed, the latest American opera to be written. Mr. Moyle has had more than a dozen experiences with the foreign producers dominating the American operatic stage, and American composers, who eventually have written his music for him through direct dealings between them, hold up their hands and say: "What's the use? We cannot get it produced after we have completed it!" Yet librettists and composers, with the Anglo-Saxon spirit that is never whipped, continue their writing and their composing, against that time when we shall seize control of our own music and produce our own operas, based on our own historic deeds, rather than the mythology of Germany, Italy, France or Spain.

Mr. Moyle, who knows the operatic condition in America today probably as well as any American, is not backward in his description of that condition. "Why have we no American opera?" he repeated my question the other day. "Because we put only foreigners on guard in our opera houses. We not only allow them to be there; we *PUT* them there, and then we allow them to say what we shall and what we shall not have in our musical life. They are immaculate, these foreign dictators of America's music; they are suave; they are amazingly polite. The poor devil of an American who goes to them to have an opera produced gets a surprising amount of courtesy—and nothing else. In this the foreign impresario is aided and abetted by the 'society' element of opera goers, who appear so suddenly and mysteriously when the lights come on at the end of the first act. But there is hope, for the student of musical history knows that the foreign influence is a

What Difference Does It Make?

GOVERNOR SMITH, of New York, enjoyed a manufactured prominence for several weeks in a matter that means really nothing at all. New York State had and has an absolute right to modify or abrogate any law made by it. It has abrogated the prohibition enforcement act made by it. The act was no good anyway. It was never enforced. It never would have been enforced had it remained on the books for a thousand years. The principal causes of the recent eruptions in print were the desire to make Governor Smith's action a decisive blow at the Constitutional provision regarding liquor and, secondly, to enhance his importance as a Presidential candidate—or, to be perfectly honest, not a candidate but a name with which to trade state delegations. Both these efforts have failed. Governor Smith did not act with the directness and decision of a statesman, and what New York does in the question at issue makes no difference whatever. If the Federal Government desires to enforce the Prohibition law in New York, it can do so, but such a course would probably be unpopular except with the small American colony residing in New York City. The American Colony in New York, like the American colonies in other foreign cities, would doubtless be glad to keep on loyal terms with the Government of the United States.

Wage Cost in Industry

ACCORDING to an official report of the lumber industry from the United States Department of Labor, the lumber mills in Georgia show the smallest average output per employe, the lowest wage an hour and the highest labor cost in production. Oregon, on the other hand, reverses the scale, heading the list with the largest output per employe, the highest average wage an hour, and the lowest labor cost per unit of production.

In Georgia the average output is fifty feet in band-saw mills, and the minimum wage, forty cents an hour. In Oregon the average output is 117 feet and the maximum wage $1.50 an hour.

The comparison is not definite and the result may come partly from causes other than merely wages paid, such as condition of timber, but the fact remains that the showing demonstrates that low wages and low productivity are like the Siamese twins, inseparable, and that the time rate of wages is not a criterion of labor cost in a given product.

The Cost of Bond-age

MT. PLEASANT, MICHIGAN, furnishes an example of the cost of bonding a municipality for long terms. An issue made in 1892 matures in 1927, when, if then paid, it will have cost, for a loan of $15,000, an aggregate of $39,750.

The debt was contracted for the improvement of the municipally owned waterworks, and the original bonds ran for fifteen years at five per cent. No provision was made for a sinking fund, and we judge there was no attempt to secure a profit from private consumers, and, at the end of the period, a refunding issue, running twenty years, was negotiated at four and one-fourth per cent. The city authorities made no provision for a sinking fund at this time, either, and at the present time the original debt still remains.

The question of paying the bonds in 1907 was one which the village authorities feared to tackle. At that time the annual budget was but $17,500, and to spread a tax for the full $15,000 would have doubled the rate, almost. The rate then was $9.80 for $1,000, and to have collected $18 would have closed some official careers, although in the end the city would have benefited.

Of course, if the sinking fund had been provided for in the first place, and honestly administered, the bonds would have been retired at maturity, and a saving of the interest on the refunding bonds effected.

Carl H. Peterson, city manager of Mt. Pleasant, is an enthusiast in the pay-as-you-go policy for municipalities, and in emergencies, where bond issues seem imperative, favors serial issues rather than long-term obligations. He has pointed out that, had serial bonds been issued and cared for in the case of this loan, the saving would have amounted to $18,750, or about three-fourths of the total interest charge.

The first appropriation for a sinking fund was made in 1922, when $2,000 was set aside toward retiring the bonds at present maturity. Meanwhile other bonds have been issued and the interest portion of the tax dollar is on a par with that of other cities of its class.

Poet's Conquest

ROBERT FROST ambled out across the platform of a small hall at the University of Michigan. He wore a gray suit with a sack coat; his face was New England with maybe a Massachusetts emphasis, and his voice was New England of the pastures, but his mind was New England with something of Midwestern shrewdness—a shrewdness that makes possible at times a noble irreverence. He began to read his own poems, half apologetically, as if there were an element of humor in a man reading his own poems. In the midst of the academic quiet the mammoth building program of the University of Michigan asserted itself; a boilermaker played with his hammer on great resounding sheets of metal. It was machinery against poetry, and someone slipped from the hall, whereupon the boilermaker found repose. Downstairs, then, an orchestra burst gaily into the first measures of a dance, and the voices of happy youngsters floated into the room where Robert Frost stood, sometimes saying things that his audience understood. Again persons left the hall and the orchestra became silent, and the young people, too. And so the poet conquered industry and youth, as poets should. He read about Snow, and with queer whimsical inflection—the very opposite of effort or skill—he let the spirits of New England folk find the spirits of Michigan folk by the barest transmission of ideas, the common things that men and women say when they are just themselves. And the boilermaker held his hammer still and the orchestra waited downstairs, silent. And being a poet, Robert Frost hastened the end of the reading, because he knows that hammers are instruments of expression too and poems too wonderful to be written are begun by college boys and girls on nights in early June.

Who Pays the Taxes

WASHINGTON dispatches recently stated that manufacturers of the country paid 76.83 per cent of the Federal taxes received. If the whole truth were told, the statement would be something like this: "Of the Federal tax burden laid on the people of the United States, so much reached the Treasury through the collectors, and 76.83 per cent of the amount received was collected by manufacturers."

Manufacture pays no taxes. Every assessment against manufacture is added, together with a profit, to the price, and in the end Mr. Ultimate Consumer, although not listed on the tax rolls, pays the shot.

A manufacturing center derives its profits from sales all over the country, sometimes from other countries, so it may happen that a part of the nation's revenue is paid by some foreign ultimate consumer who has purchased American goods, although not under the protection of Old Glory.

Muddle-Headed Thinking

UNDER the title, "Dangers of Muddle-headed Thinking," in *Banker and Financier*, the American Acceptance Council scores a majority of bankers and economists of the country for the menace of their discussions of the possibility of too great inflation in the present trend of enlarged money and credit volume.

There is a basis of truth in the position of the council, since it is a fact that a majority of people take one side or the other of any theory at secondhand, and for that reason the publicist who has less logic in his argument than reputation with the public may easily do great damage by creating an unwarranted demand for wrong action.

Public opinion is the strongest force we know. Men and measures are approved or condemned by it regardless of merit or demerit. The greatest reformers of the ages have been martyrs to the prejudice of a public mind which later has been forced to admit its error.

The basis of the council's censure of the muddle-headed thinking it deplores is the general acceptance of the belief that the depression of the past three years was due to deflation, and that the inflation of the past few months has a part in the present era of prosperity or will affect business one way or the other whether it is continued or halted.

In proof of its argument it submits that deflation followed the business crash as inflation now has followed the revival of industry, a point in which the council stands alone, or nearly alone. It assumes the public mind to have taken cause for effect, and to have ignored other elements entering into the matter. As to other causes, chief among which is chargeable to the psychology of the general situation, there can be no dispute. But that deflation and inflation, generally speaking, affect the result, we believe the public has a more accurate conception than has the council. In fact, its perversion of fact as to the precedence of deflation and depression is so bald as to destroy its argument.

The public knows now, what it did not know then, that the warm battle between the advocates of immediate deflation and those counseling a gradual tightening of the reins was won by the former in the Federal Reserve Board, and that the prediction of the latter was immediately fulfilled. The public did not then know that prior to that time there had been the same warnings as to the necessity for care in future commitments, and so it kept on as if cash and credit must continue indefinitely.

The effect of a sudden curtailment of credit and the refusal to renew outstanding loans, together with the retirement from actual circulation of currency, was natural and is known to all. This is the first time it has been denied, so far as we know.

That the discount rate could affect the situation only lightly, as the council claims, is probably true. Banks will pay any discount rate if legitimate borrowing demand warrants it; but with a threatened call for liquidation and no possibility of renewing existing obligations, money will not be ventured for any purpose.

One Guess as Good as Another

"THE Trader," a clever writer in *Barron's Weekly,* comments on the statement of a savings bank officer that increased employment and some advance in wages had not shown in increased savings deposits. In fact, there has been a steady lessening of deposits, until now withdrawals appear. Guessing on this phenomenon, the opinion is advanced that workers have failed to heed the lesson of 1920-21 and are again recklessly extravagant. "They are buying automobiles on the installment plan."

There is no doubt an increased investment in motor vehicles—which is not necessarily an extravagance. *It does not decrease the buyer's real wealth.* But here is another guess: Every worker, every tenant who can escape the rapidly increasing rentals of our cities, is taking a chance to provide himself a home in decent surroundings at a distance from the congested centers, which makes his automobile a necessity and a real economy in time.

A less fortunate situation is the increasing cost of living, with which "increased wages" have not so far kept pace, as instanced in the boasted boost of scales in steel production to a level of forty cents an hour for unskilled labor.

Mr. Ford's Page

THERE was a time in this country when the business of Government was so efficiently conducted—that is, so much more efficiently than any other kind of business—that it commanded the respect and admiration of all the people. It passed as an article of the common faith that what the Government did was exceptionally well done. Of course, we respect the Government as our government today, but admiration for its superior ability is not so great as it was. The reason is that the private business of the country has grown to greater proficiency than has the public business. Or maybe it would be more correct to say that the private business of the country is becoming more and more the public business.

These statements are not made in a political sense. What is said about government is true, for example, of the universities also. We no longer go to universities to find our wisest men. There are, it is true, well-informed men to be found in those institutions. They are learned in books. They find their way easily among the various speculations which pass for learning nowadays. They are not at a loss in naming and sometimes valuing the various guesses which others of their class have made about things. And doubtless they have a good influence upon the minds of young men and women, reminding them by the very presence and the activities and atmosphere of the university that there is that side of life. But to trust anything entirely to the universities would be to invite failure.

The things that are most vital to the world now are not yet in the books. They are being lived by men who are in the front line of advance. In the course of a decade or so they may find their way into the books and be taught to young men who are coming on. Young men ought to know what is in the books, because it enables them to start abreast of their own recent times; but to accept the books as the highwater mark of discovery and practice is to show oneself rather innocent of the facts of life. Even in industry, the shop constitutes a better book for the book-trained man than does the classroom, because the classroom deals with what was done a few years ago—except, of course (there are always exceptions), where teachers who are themselves ahead of the books are living in the living things not yet standardized into textbook copy

So that it is not, as some say, a descent to a lower plane of thought when it is proposed that public business listen to private business for some suggestions. There is a class of men and women who deplore the fact that the "smoke chimney of the factory" is beginning to smudge our public life. Of course they don't know what they are saying. They fancy a picture of society like that which obtained in ancient Greece when really the better individuals of the community were in public life, when the superior class held office.

WHEN the nation was born it drew its wisdom from the common life, and when the national principles became established and it seemed safe to leave the nation's affairs in the hands of the constituted officials, the wisdom of the common life began to circulate through other veins of the nation's interest. Government has not been the main interest, has not claimed the main strength of this nation for a number of years. Now, however, because of the need, the strength and wisdom of the nation is again flowing back toward Government, and it is not welcomed. When the people begin to think of their country and to offer it their accumulated wisdom, it is sheer folly to interpret their interest in terms of politics. Had there been less politics, there had been less need for popular concern today.

There have been times in the life of various peoples when the cream of the intellect and character of a country floated to the top—the "top" being official position. And in those times it would have been morally an impertinence for the lower orders to have insisted on interfering with the serene power of the upper classes. Blood does tell; brains do count; the emergence of the mind powerful enough to rule and to serve is a fact so important that its sphere of work is worthy of all protection.

But it is no longer true that the best people are the "top" of society, as we are led to see the "top" through the society pages, for example, or through the reports of individual wealth. It is so easy nowadays to attain what fifty years ago was called "position" that it doesn't mean anything. The leaders are not classified as they formerly were. They are not thinking so much about their prestige or their position as about their work.

So that this mistake is due for correction soon, that the irruption of the ideas of private business into the realm of public affairs is an impertinence and an assault upon the dignity of the government. It really means that the true force of the country is beginning to make itself felt from the plane where it has been recently most active, upon the plane where it has been recently most missed.

And what the business mind of the nation will say is very plain and practical. It will deal first with material matters—in which it will again challenge the condemnation of the people who deny "spirituality" to industry. The day of principles in verbal form has been a long day and a useful one; principles are now to be cast in action. The long hypnotic spell of words is to be broken; the long hypocrisy of using terms for qualities that we cannot demonstrate is to be done away. The things we really believe, true or false, shall have their chance in action; by action's test shall they stand or fall.

That is one value to the world of the Russian experiment. They wanted direct action; they got it; they found, as we all have found in factory and shop, that "direct action" is the most austere tribunal to which one can appeal. From the child touching a hot stove to see if it burns, to the revolutionary attacking human nature to see if it turns, both are up against something that is fixed. The universe is fool-proof. We can destroy our illusions but not the truth. And as between what we used to call "necessity" and "free will"—they have invented new names for them lately—there is a sufficient length of rope leading off from each to give us more roving room than we can profitably use.

Well, what has been moving in this country is that the principles about which we used to deliver orations have been taken out of the public assembly and put into the overalls of everyday business. If a thing sounds true in the United States Senate when a Daniel Webster says it, it ought to work true a thousand miles from the Senate when a plain citizen tests it. That is what has been happening in this country. We have taken the Eagle down to see whether it is any better than an ornament, and the splendid thing is that it shows itself a great bird. But coming from the country back to Washington it is somehow not held in as high respect as once it was when it came from Washington to the country.

But that which is coming back from the country to the Government is the salvation of the latter, if it will only heed. The curse of the whole business is that most of the members of the Government have lived so long in Washington that they find it impossible to believe that anyone has any interest in the country aside from a political position. There is a habit of mind at Washington which has seized upon all our officials from the highest to the lowest, and it is this: the man who thinks enough of his country to take note of how it is being managed, does so for no other reason than to oust the present managers and take their places. That is the Washington reaction to the interest of citizens of the United States in the Government. The result is, of course, two losses: Washington loses the assistance that it might have from the people; and the rest of us lose the satisfaction of feeling that we have a group of officials who are as much interested in the welfare of the United States as we are.

Why can't we get together on the welfare of the United States, instead of continually suspecting people of wanting to get certain people into office or certain people out of office? The fault, it must be said, is with the constituted officials. We look up to them. If they were as fair on their part as the people are on their part, our government would become what it was meant to be, a co-operation of the best minds of the country; not the best minds among the officeholders only, but the best minds among the people, too.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

See the Word "Except" on Your Dollar Bill

Who Is Responsible for Two Kinds of Currency?

By JOHN BASIL BARNHILL

Reader, have you a Greenback in your pocket?

Oh, yes, there are Greenbacks—much as the "experts" would have you think otherwise, there are still Greenbacks!—Take one out of your pocket—a dollar bill—and mark well the language which it bears.

It is money—**except!** Look at the fine print on the bill and find the word **"except."** Although it is American money, it is not good for everything, as the following inscription attests:

"This note is a legal tender at its face value for all debts, public and private, EXCEPT duties on imports and interests on the public debt."

So, good citizen, you perhaps handle every day this transcript of the famous Exception clause of the Legal Tender Act—a clause which has inspired millions of words in denunciation and defense. This was only one of a score or more amendments which the Senate added to the original House Bill, all conceived in the interests of the money brokers.

Thaddeus Stevens fought all these amendments to the last ditch.

I Repose In This Quiet And Secluded Spot,
Not From Any Natural Preference For Solitude,
But Finding Other Cemeteries Limited By Charter Rules As To Race,
I Have Chosen This That I Might Illustrate In My Death
The Principles That I Advocated Through A Long Life,
Equality Of Man Before His Creator.

THE foregoing inscription, written by himself, adorns the monument which Lancaster, Pennsylvania, has erected to her great citizen, her greatest citizen save Franklin—Thaddeus Stevens. Stevens rejected burial in cemeteries the charters of which forbade the interment of colored persons, and selected as his last resting place Schreiner's cemetery, a private and humble burying-place, near one of the public schools of Lancaster. The proximity of the school was quite fitting, as Stevens was truly called The Father of the Public School System of Pennsylvania.

But the monument, to be complete, should also display the tributes which his contemporaries bore to Stevens' greatness of mind and heart, as follows:

Stevens knows more than all the rest of us.—*John Wentworth, M. C.*

When Stevens leaves the House, he will take out of it more backbone than he left in it.—*Salmon P. Chase.*

Politician, calculator, time-server, stand aside! A hero statesman passes to his reward.—*Charles Sumner.*

A brief glance at Stevens' career before entering Congress demonstrates that "he was great ere Fortune made him so." Born April 4, 1792, at Danville, Vermont, he was graduated at Dartmouth College in 1811, taught school and studied law at York, Pennsylvania, and in due course began the practice of law at Gettysburg, Pennsylvania. He served as a member of the legislature of Pennsylvania from 1833 to 1841. One of the most remarkable speeches of his whole career was delivered in the legislature. In this speech he changed enough votes, both in the House and Senate, to save the public schools of Pennsylvania, defying the instructions of his constituents and closing with a stirring plea for political courage as the basis of true popularity. Entering Congress in 1849 from the Lancaster (Pennsylvania), District, to which larger city he had moved in 1842, his life is henceforth interwoven with the tangled skein of that troubled period.

An Heroic Character

THE character of Thaddeus Stevens was cast in an heroic mold. In his presence all pretense and insincerity withered away. If the hand of Providence is seen in putting Lincoln in the White House, no less providential does it seem that a man of such supreme and trained ability and of such incorruptible honesty as Thaddeus Stevens should have been selected, as it were, out of scores of public men, to preside over the all-important Committee on Ways and Means of the House of Representatives during the Civil War—a committee charged with the responsibility of originating all revenue measures.

During the whole period of the Civil War *this Committee was compelled to deal with all fiscal measures.* The House Committee on Banking and Currency was not instituted until March 2, 1865. The Senate Committee on Banking and Currency was established March 15, 1913.

Thus Stevens, in the legislative field, was as supreme as Lincoln was in the executive branch of the government.

Peter Cooper, in accepting the nomination of the Greenback party for the Presidency in 1876 (Indianapolis, May 17), said:

"The introduction of that little word *'except'* into the original law drew tears from the eyes of Thaddeus Stevens when he looked down the current of events and saw our bonds in the hands of foreigners who would be receiving a gold interest on every hundred dollars of bonds that cost them but fifty or sixty dollars in gold. But for the introduction of that word *'except'* into that original law our bonds would have been taken at par by our own people, and the interest would have been paid at home in currency, instead of being paid to foreigners in gold."

The famous *Exception clause* of the first Legal Tender Act has inspired a perfect flood of denunciation and defense. The issues under this act were made legal tender to the government and the people for everything "*excepting* duties on imports and interest on the public debt," thus forcing the government to go into the market and buy gold from the speculators in that metal with which to pay the interest. This was the fatal entering wedge. Had they been made legal tender for everything, the best authorities affirm that they would never have been at a discount.

It was enough to inspire the profound distrust, and even to evoke the tears, of such a patriot as Thaddeus Stevens, to see that, in spite of his heroic efforts to establish a national currency, void of every vestige of special privilege, the gold faction, trafficking in the honor of the country, the deepest emotions of its patriotic citizens and even in the very blood of its soldiers, had immeasurably increased the terrible burden under which the nation was staggering, by making a home debt a foreign debt, by making a paper debt a coin debt, by making a coin debt a gold debt.

As the war proceeded the demands of the friends of gold grew bolder, but Stevens, like Prometheus, "never changed, nor faltered, nor repented"; he continued, to the last, the firm advocate of the cause of the Nation's Money. On November 12, 1867, eight months before his death, in reply to a constituent, he published a long letter in the Cincinnati *Commercial* in which he describes the circumstances under which the first Legal Tender Act passed the House in February, 1862. He says:

"Then nothing was said about the currency in which either principal or interest was to be paid. No one, I suppose, doubted that the loans of the United States, of every description, were payable in the money of the United States, of every description; but, to change that aspect, as it regarded a portion of the fund, the New York money changers again made their appearance, Jew and Gentile mingling in sweet communion, to discover some invention to make in a day what it would take weeks for honest men to earn. They went directly to the Committee on Ways and Means and asked that the interest should be made payable in coin leaving the principal as it was. The committee utterly rejected this absurd proposition—two legal tenders in the same empire for the same commodities."

Act Mangled in Senate

IT WAS in the Senate that the measure was so mangled, that, as Stevens said, its own father could hardly recognize it. Of these amendments Stevens said, as reported in the *Congressional Globe* of February 20, 1862:

"I have a melancholy foreboding that we are about to consummate a cunningly devised scheme, which will carry great injury and great loss to all classes of people throughout the Union . . . . There was a doleful sound came up from the caverns of the bullion brokers and from the associated banks. It now creates money and by its very terms declares it a depreciated currency. *It makes two classes of money*—one for banks and brokers—another for the people."

On his deathbed (he died August 11, 1868) the Great Commoner said:

"Yes, we had to yield. The Senate was stubborn. We did not yield, however, until we found that the country must be lost or the bankers gratified. And we have sought to save the country, in spite of the cupidity of its wealthier citizens. When, a few years hence, the people shall have been brought to general bankruptcy (the patriot and prophet foresaw the panic of 1873), I shall have the satisfaction of knowing that I attempted to prevent it."

In a letter to the Cincinnati *Commercial* which broadly covers the whole field of Civil War finance, Stevens says: "How does the European creditor stand with relation to our bonds! Most of them, I presume, are held in Frankfort and London! For the money lenders there are more sharp-scented than those who were cudgeled out of the Temple. At the time they were bought in, gold was 281, or, rather, Greenbacks were at that discount, by the arrangement of the market. But suppose them to have sold at that time for forty per cent which was the highest I think they commanded—what was the operation? The purchaser paid, today, $400 in gold for $1,000 and next Monday, quarter day, received the interest on $1,000 in gold and so ever since; and now claims that when the principal falls due in a year or two it shall be paid in coin. This is what they call honor, conscience, justice, and tell the farmers of America that they were bound to pay the money-dealers of Europe this enormous rate to save their property from destruction; and the moral men of New York denounce us as dishonorable robbers and swindlers if we do not in forty years quadruple the capital of the Rothschilds, Goldsmiths and other large money-dealers. I must beg leave to judge for myself of this monstrous proposition . . . . Why is this clamor against the legal tender which answers all the purposes of solid metal and which has never been complained of by the business men of the community."

Protested to the Last

THE flame of indignation against the "monstrous propositions" of the gold interests burned ever more brightly as this great Friend of the People neared the end of his earthly career. Perhaps his most dramatic declaration on the subject is that reported in the *Congressional Globe* of July 17, 1868, three weeks before his death, a speech which is worthy to rank with that of another great lion of liberty, Lord Chatham, when he was carried from his bed to denounce, almost with his expiring breath, the attempt of the North Ministry to conquer the American colonies. When Stevens heard it suggested in the House of Representatives that certain loans were payable only in gold, his indignation burst the bonds of party loyalty as he boldly declared:

"After they fall due they are payable in money, just as the gentleman understands money, just as I understand it, just as we all understood it, when we passed the law authorizing that loan; just as it was a dozen times explained upon the floor by the Chairman of the Committee on Ways and Means when called upon by gentlemen to explain what it meant, and just as the whole House agreed that it meant. I want to say, that if I knew that any party in this country would go for paying in coin that which is payable in money, thus enhancing it one-half; if I knew that there was such a determination this day on the part of my party, I would vote for the other side, Frank Blair and all. I would vote for no such swindle upon the taxpayers of this country; I would vote for no such speculation in favor of the large bond holders, the millionaires who took advantage of our folly in granting them coin payment of interest. And I declare—well, it is hard to say it—but if even Frank Blair stood upon the platform of paying the bonds according to the contract, and the Republican candidates stood upon the platform of paying bloated speculators twice the amount which we agreed to pay them, then I would vote for Frank Blair, even if a worse man than Seymour headed the ticket. That is all I want to say."

Thus it will be seen that Stevens protested to the last against the course of turning over the financial policy of the government to the international, or, rather, the nationless *banditti* who find their harvest in all wars and who are as certain to be at, or near, every war council as buzzards are to be at a carrion feast.

Fought Against Privilege

IN THE long and noble record of Congressional discussion there are no more interesting or important debates than those during the Civil War in which Thaddeus Stevens stood, almost alone, as the champion of an unprivileged money system. The public schools of Pennsylvania call Thaddeus Stevens by the name of Father; what more gracious acknowledgment could that state make to the creator of its public schools than to prescribe a course of systematic study in Stevens's greatest intellectual achievements which are to be found in the debates on finance during the Civil War? There, verily, will be found the pure milk of the gospel of financial liberty in "thoughts that breathe and words that burn." Indeed, if public schools in every state would pursue such a course of study they would perhaps accomplish more than by any other means, to help in the solution of those great problems whose unsolved condition passed like a shadow before the dying gaze of the Great Commoner.

Lincoln and Stevens—the two outstanding figures of the Civil War: here, indeed, comparison would be odious. It is no exaggeration to say that Stevens, no less than Lincoln, gave "the last full measure of devotion" first to his state, then to the nation, then to the colored race. And of Stevens, at least, it can be said that he fought no less unselfishly to give to the commerce of the country the fetterless wings of a free and unprivileged money system, and it is not a rash prophecy that in the years to come this will prove the brightest jewel in the coronet of all his mighty achievements.

In the granite ruggedness of his character and in the unpolished but overwhelming speech of which he was master, Stevens suggests comparison with Danton. He, too, made his slogan, "Audacity, audacity, forever audacity." In other respects Stevens challenges comparison with Mirabeau. Like this great French orator Stevens might have said, "I have fought for Liberty for a quarter of a century"; only Stevens would have said, "half a century." So, also, like Mirabeau, Stevens might have declared: "My fight has ever been against Privilege and all privileged orders."

The exile from Italy said: "When I die, examine my heart and you will find ITALIA inscribed on it." If Stevens's heart had been examined, the words LIBERTY AND BROTHERHOOD would have been found inscribed there.

Homes Hundreds of Feet Above the Street

Unique Bungalows Among Dwellings Built on Roofs of Skyscrapers

By J. OLIN HOWE

AN AVIATOR flying low over New York might be puzzled to account for what seem like country homes, surrounded by greensward and flowers and shrubbery, where he had looked only for a dull expanse of roofs. Perhaps he would see a man clad in white flannels placidly smoking a pipe and strolling through a lovely garden, or a little child feeding her pet chickens; near by there would be a tennis game.

It would be very real homes atop New York skyscrapers that the flier would see. Hundreds of feet above the rush and roar of city streets the fortunate occupants enjoy all the peace and quiet freedom of the suburbs, yet need only take a convenient elevator to be in the center of city activities.

Theirs is the ozone of the upper air and all the refreshing influence of the night silences without the necessity of rail or motor travel at the beginning and end of the day. To be sure, they may not drive a golf ball far ere they reach the limits of their airy domain, but putting and clock golf are not unknown to metropolitan roofs.

And on one roof there is even a little lake with its lilies and other water plants and a tiny boat and—although writing "fish" makes the story difficult to believe—I have eaten a trout taken from a pool in the garden of a roof-top estate. And the little brook which comes purling over the stones down into that shaded pool must have made the trout feel at home.

They are of varied architecture, these homes on high—bungalows, one-story mission houses in California style, story-and-a-half cottages which might have been transplanted from a New England village, and so on. On top of an apartment house finished not long ago is a home of two full stories in the colonial manner with porch and gallery.

The effect is much as though this pretentious dwelling were perched on a mountain height, snugly fastened to an age-old crag to defy successfully all winds that blow. From its windows one looks out over the Hudson River and across at the Palisades on the New Jersey side; and on clear days the Goddess of Liberty looms up on Bedloe's Island in the upper bay and one sees great ships going down to the open sea beyond Staten Island.

There is a pretty story about the house on the roof with its own lake in its front yard, which has enough of truth in it to be worth repeating. This is atop an imposing apartment house on Central Park West which is owned by the occupant of the roof dwelling.

At the time of the completion of the place, the owner went to his home in the West to marry and to the bride-to-be described the delights of the home. She had the idea, however, that it was in the suburbs. After their wedding journey the two arrived in New York in the evening, the bride failing to pay detailed attention to her surroundings.

Next morning she looked from her window upon a scene of green turf and real trees—albeit none too large—with real birds singing in them, and beyond a dear bit of lake with its own rowboat.

"Why, this is the country," she exclaimed.

"Yes, dear," replied her husband, "the country in the city. It's like the minstrel joke about the man who came into a city hotel late at night and was told that the only room they had vacant was on the forty-ninth floor. 'All right,' he said, 'I'll take that, and if anyone asks for me, tell 'em I'm out of town.'"

It is well over a generation ago that New York began to think of the roof of a tall building as a place to live—for the janitor. They built living quarters for the building's superintendent on the roof of an early skyscraper on lower Broadway about '88 and actually had difficulty inducing families to live there.

Finally, about 1906, a bachelor architect in search of light and air occupied a small wooden structure on the roof of an office building and even made himself a garden before his front door. He went to no small trouble to get earth enough on the roof to fill several flower boxes, and felt he had achieved a triumph.

Today they manage smooth lawns and flower beds and even small trees and good-sized shrubs (in carefully concealed tubs of earth) on New York roofs, and grow vegetables there as well. On one roof the owner of a handsome dwelling, an architect, has a chicken yard and brags about the number of eggs his little daughter's pullets lay. He would gratify her wish for a cow up there but for the city ordinances. As it is he grows his own corn and cabbages and lettuce and tomatoes and other vegetables, and has a sizeable aquarium.

Architects were first to bring to New York's attention the desirability of these country places high in the air. One member of a firm of architects known from coast to coast built the first bungalow on the roof of an office building in the Grand Central district. He planned to have his office on that roof, but when his wife learned of this she urged that they build a home there. The result was a $25,000 house of seven rooms and three baths 300 feet above the pavement.

"Two hundred and fifteen feet in the air is as good as 215 miles from the city," says another architect, equally well known. He lives and works that distance above Madison avenue atop an office building.

"You ought to take space in the building," remarked the man who was about to build it when the architect was explaining the plans to him.

"So I will," replied the latter. "I'll take the roof and I'll pay you well for it."

A lease was drawn at once for the entire roof space, similar to a ground lease, and the architect signed it. He built on his "lot" an attractive bungalow which sprawls comfortably on the roof and affords him an ample bachelor apartment in which to live, a handsome private office and large consultation rooms and commodious, sunny quarters for his draughtsmen and the others of his staff.

The owner has laid out a formal garden. There is a fountain of no little beauty with water bubbling at the feet of a cherub and an old-fashioned lantern in a lattice illumines the garden by night.

While perhaps architects more than any other class of professional men have their homes on New York skyscrapers, the dwellers on high are by no means limited to them. In the financial district, hardly a stone's throw from the Stock Exchange, where it is quieter o' nights than one unacquainted with the locality would dream could be the case, the head of a corporation which owns and operates public utilities in many parts of the country has his home where an office building reaches toward the clouds. There are telephones, of course, but their numbers are not in the book and when he retires to his private residence he is as inaccessible as though in the Canadian woods.

Two or three lawyers whose names are familiar live on New York's roofs. And artists and sculptors and sculptresses and composers and writers and at least one doctor dwell thus high in the air along with the architects, to say nothing of plain business men who fancy this mode of life.

An opera singer, whose voice has been heard on the phonograph by even more thousands than have heard her in person, was unable to find anything in the way of an apartment which suited her until an uptown real estate firm offered her a bungalow atop a high loft building in its charge. There she makes her New York home, with her family and her pets, and she says her travels about the United States have shown her no country place she would exchange hers for.

A college professor and his wife have a fascinating bungalow on the roof of a towering studio building in the Carnegie Hall district and it is noted for the originality of its furnishing. The original tenant was a writer of boys' stories, who gave it much character and then moved to another roof-top home. She now has several such under her control.

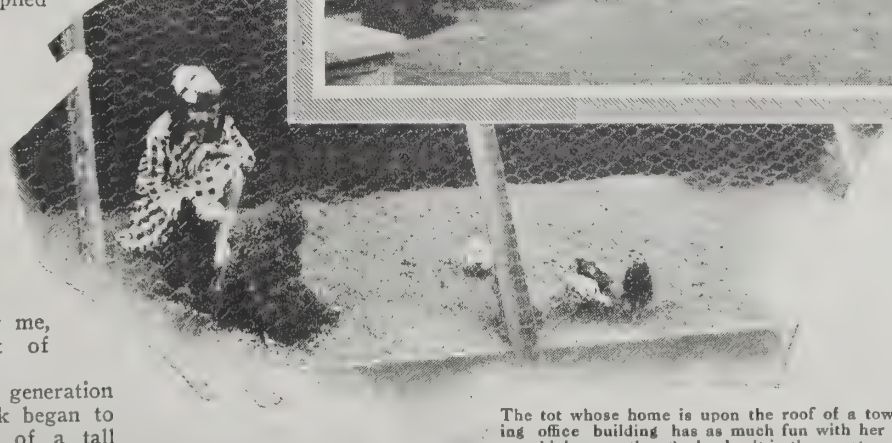
One of these airy dwellings in the West Forties is the realization of the dream of two decades of its owner, a business man who should have been an artist. He has 3,000 feet of roof space. In his fine home the fireplaces burn real wood and there is every fitting and appurtenance of the most modern dwelling, which is generally true of these homes on the roofs.

Above—What more has life in a country home to offer than in this comfortable abode high in the air amid city roofs?

Right—Two sculptors of note live and work in this airy dwelling far above the madding crowd.

Below—A formal "garden" on the roof of a New York skyscraper.

(C) Keystone



The tot whose home is upon the roof of a towering office building has as much fun with her pet chickens as though she dwelt in the country.

The Poor Handling of Our Washington News

Facts Badly Garbled Through "Interpretation" and Sheer Laziness

By a Newspaper Editor of Many Years' Experience

PERIODICALLY the complaint is made that newspapers twist and pervert the news they print, from motives ranging from the selfish and the self-interested to the criminal. Newspaper owners or newspaper workers always rise to resent the complaint, and always with genuine and honest indignation. Mr. Upton Sinclair set out to picture the perversion of the news in his novel, "The Brass Check." In his indictment lurked a good deal of the truth. In the main he was mistaken.

It is perfectly true that there are newspapers in whose offices the news is deliberately trimmed to suit the prejudices of owner or editor. Such papers are few. Critics of the newspapers, like Mr. Sinclair, are both wrong and right. They are nearly always wrong in charging newspaper owners and workers with immoral impulses in shaping their accounts of the news to suit their own interests. The critics are right, nevertheless, in their contention that the news is seldom presented, even in the most ably conducted papers, in a manner that is fair, square, positive, and accurate.

It must be remembered that the man who owns a newspaper is a human being. However able and high-minded he may be, he has his strictly personal "slants," his likes and dislikes for public personages, his prejudices, and all that goes to make even the enlightened human being. It must also be remembered that the owner of a newspaper is not operating a public welfare institution purely and simply. He may sincerely wish to benefit his community through the medium of his newspaper. But his newspaper is after all his business enterprise. It must make him a living, a profit. Benefactor he means to be, and benefactor he is—in part—but only in part. He is also the business man. He soon learns that a certain number of his fellow Americans have the same prejudices and preferences as himself. For that reason they buy his paper. They constitute his circulation. And in buying his paper, they justify him and encourage him in the further indulgence of his personal likes and dislikes.

Reflect Employers' Beliefs

A NEWSPAPER is thus always conditioned by the turn of mind of its owner and the stamp he puts upon its news output. His reporters and editors soon take their cue from him. An honest editor or news writer may so differ from the policy of his employer as to feel morally obliged to quit and seek service elsewhere. Those who stick by a paper do so by reflecting, willingly or unconsciously, the tastes and principles and beliefs of their employer.

This accounts for much of the so-called "coloring" of the news. Where such coloring exists, it is not necessarily immoral or criminal, or vicious. It is merely human. The newspaper as an institution merely partakes of the fallibility, the weaknesses, the failings that are inherent in all human institutions.

Within the bounds of this human restriction, it is safe to say that all but a few of our newspapers are run in a spirit of honesty. They may not perfectly succeed, but they try to present the facts of the news accurately and impartially. The effort is always there; the success is there only a part of the time. The reason is that the owner of a newspaper is not the only human being attached to the paper. Every one of its servitors is human, subject to his own personal dislikes and preferences, subject to the average of human failure. Here is the point where the real mistakes in the newspaper occur. The owner may be of the highest character of American citizen. He may do his utmost to give his paper the high stamp of his own conscience. But in the issuance of his paper he must depend upon other human beings with their weaknesses. He may have built up and drilled what he takes to be a perfect system of news-gathering and news-presentment. But his system is composed of human elements. And it is in this system, in this complicated process of news-gathering, news-handling, and news-presenting that the mangling of the news occurs.

The presenting of the news can be made more perfect only as humanity itself becomes more perfect. In the meantime a good deal of mischief can be done, and is done. There is no escaping it. But there is an escaping of the consequences. If the readers of the newspapers understood more intimately the hard conditions under which the news they read is gathered and handled, they would save themselves from many a misconception. They would also read their papers with better understanding. Finally, they would better comprehend the struggling, baffled, blundering and yet succeeding life about them. After all, the mistakes of newspapers are only of a piece with the mistakes of life in general.

After all, it is not only the writer of news who is at fault; it is also the reader of the news. Public opinion would save itself from many a mistake in judgment, if the public were less inclined to accept as "so" whatever it reads in cold type. The public should be better instructed as to the element of human error that enters into the finding and editing of the news. It would then read its newspapers in the proper critical spirit. It would then find the news where the news really exists.

The news in the newspapers exists *between the lines.*

Newspapers are not so read: hence all the charges of dishonest editing, of garbled or colored news stories, of papers edited or conducted for the benefit of sinister private or corporate interests.

The public needs to learn how to read its newspapers. Until it does that, it permits mischief to be done. Not deliberate mischief, only the mischief inevitably resulting from beings and systems of beings that must remain human.

For an example of this mischief we have only to turn to the news emanating from the seat of government at Washington. There the news is handled as imperfectly as anywhere. There the human element enters in most strongly, to blur the strict impartiality of the news picture. The political bias of the newspapers interferes to distort the reports of their employes. And there the resulting mischief to the country is greatest accordingly. Evidence as to this is only too plentiful to prove the case. This country gets a poor, inadequate, inaccurate, and a sometimes utterly perverted version of the most important news of all—the news of the United States Government at Washington.

This is a sweeping statement. It will be hotly challenged. It will be challenged by many an honest and able Washington correspondent. The answer is that while most of these correspondents are able and honest, few of them take the trouble to get the real news. The outstanding Washington correspondents still do this: they are not only able and honest, but they are painstaking. They get the real news. Too many are not so painstaking. Washington is the widest-open "news" town in the world. The public servants of this country are not only willing, they are expected, to take the country into their confidence on every matter of national concern, except at stages where negotiations may argue for delay in the matter of publicity. The news is there, the property of any reporter with enterprise enough to get it. The hitch is that it is too seldom, or too energetically sought. And even when it is obtained, it is made subject to personal interference or personal "interpretation" on the part of the reporter.

To support this statement I must revert, for a space, to the first person singular. I hate to hide behind anonymity, but to prove these facts, without breaches of confidence, in the singular privileges placed at my disposal for more than a year, I must speak as an observer, a person, without a name. The individual must stand for the assertions made.

Here is an outstanding instance of imperfect reporting, and of its mischievous consequences.

The scene is the chamber of the United States Senate. The time is the summer of 1921. As any one only too painfully remembers, it was a time of business depression. The country was at a standstill. No one not "in the know" at the center of things, in Washington, has the slightest conception as to how dark was the industrial situation then. The problem of unemployment had seized the imagination of the country. Finally a Senator, the senior Senator from Illinois, had asked the Secretary of Labor for the exact figures obtainable as to the volume of unemployment.

It was my privilege to see that letter from the Senator. It was my privilege to witness the painstaking care given to the answer to his inquiry. The answer came from the Bureau of Labor Statistics. That bureau is conducted by men who are both scientists and Americans. That is to say, they serve the strict accuracy of truth, but they also think of the welfare of their country. In passing, let it be said that from this bureau issue all the reports regarding the cost of living which form the basis of so many newspaper editorials.

The Truth and the News

THE Bureau of Statistics, under the Secretary of Labor, duly supplied that official with the elaborate data needed in his reply to the Senator from Illinois. In that report it was indicated that between five and six million more workers were out of employment than was the case during the height of employment during the Great War. The bald figures were startling and discouraging, except as they were interpreted according to all the facts.

What happened?

The report of the Secretary of Labor was duly communicated to the Senator from Illinois. On a quiet summer afternoon he rose from his seat and read that report. No important debate had been scheduled. The press gallery was but partly populated. But those representatives of the press who did happen to occupy their gallery listened only to the startling totals, and paid no attention to the accompanying matter that put the proper light on the situation. They heard only that between five and six million Americans were out of work. They wired this news to the four corners of the country. An enormous sensation resulted.

The material supplied by the Secretary of Labor was careful to state the fact that there are always one and a half millions of people out of work in America even in the best of times. It also made clear that the total of unemployed reported represented the total above the maximum of employment during the stress of war times, when every available individual was put to work. These accompanying facts were ignored. The reporters in the press gallery heard nothing but the grand total of unemployed—between five and six millions.

They put this bald news on the wire and it was carried across the country. A nation already mentally depressed was still further discouraged. Hard times are chiefly a state of mind, and as the state of mind was further darkened, the state of the times became worse. A mental condition had been created directly opposite to the honest, and the scientifically proved, intentions of the Department of Labor.

From physical association with the man, I know that the Secretary of Labor was busy during weeks of that summer in correcting the wrong interpretation of a statement made by him in the interests of improving a dangerous economic state. Explanation is a weakness. One does a thing, and permits the thing done to explain itself. To add explanation weakens the effect of the thing done. Nevertheless, the Secretary of Labor felt it incumbent on himself to explain to the country how poorly he had been reported. What was the result?

The result cannot be spread upon paper in a single sentence. The climax of it comes at the end of a paragraph.

In the first place, the reporter in Washington works at a distance from his editor. The editor, as he is not on the spot, is accustomed to accept as absolutely accurate the reports of his Washington man. In the press gallery of the Senate chamber on the day mentioned, every reporter heard nothing but the startling figures that between five and six million Americans were out of work. That news alone, without a line of the qualifying material, was put on the wires to papers all over the country. The editors of those papers editorially thundered in comment on the news they had received. The picture was false by being incomplete. Without knowledge of this, the editors took the facts as they supposed the facts to be, and played upon public opinion. The result was that at a black period in the business life of the country, a serious blow was dealt to anything like business recovery. The blow may have been dealt in all innocence, without the slightest trace of vicious intent. The editors who dealt the blow may have considered themselves high-minded Americans working with the utmost zeal for the good of their country. They had dealt their blow, nevertheless.

When the Secretary of Labor put himself at elaborate pains to make clear the precise meaning of the figures he had been called upon to give, these same editors felt moved to save their faces and back their original editorial condemnation. They asserted that the Labor Secretary was welshing on his word, he had taken second thought, he was backing water. The editors had the upper hand. They were in command of their own means of publicity. The Labor Secretary had to rely upon the editors' sense of decency, or their indulgence, for the space required for his own needless answers to their own perverted conceptions as to what he had said originally. The Labor Secretary was placed in a weakened position. It was weeks before his explanation had carried into the minds of the public. All this while it was an "explanation," a token of weakness. Not the Secretary had erred, but the editors had erred. Meanwhile public opinion on the issue in question had been utterly befoozled.

The "Interpreting" Reporters

THE fault lay with the reporters in Washington.

But let us examine into their case.

To fall once again into the first person singular, it has been my lot to see fashioned, let us say during a great strike that has gripped the fortunes and the attention of the nation, a statement from a public authority so worded as to convey to the public, for the public good, the most painstakingly accurate picture of conditions as they then existed. Such a statement would be put out expressly to project an unbiased account of the state of affairs in the strike situation. The aim would be to nullify any sway of public opinion, unfairly, to one side or the other. None but a government official could be in a position to state the case thus fairly. Days of thought might have gone into the wording of that statement, so as to make it fair beyond dispute and plain beyond mistake. What happened to the statement?

Carbon copies were handed to the representatives of the press. Instead of putting the statement on the wire as it was, perhaps with some comment on the circumstances surrounding its promulgation, nearly every reporter in receipt of a copy "interpreted" the statement. Instead of reporting the thing verbatim, his instinct was to say, "Secretary So-and-So implied that —" or, "While Secretary So-and-So today said (thus and so) he undoubtedly meant—"

In other words, the government official, striving his utmost to be almost mechanically fair and impartial, was not allowed to tell the public what he had spent days and nights in shaping up. His statement was sifted through the "interpretation" of the reporters to whom he confided. Cases have occurred, by reason of this, where the original meaning of the official statement was converted into its exact opposite. Again the official had, through no fault of his own, to place himself in the weak condition of making explanations. He had to lay himself open to public doubt or suspicion. Meanwhile public opinion, with its great weight, had been started in a direction the precise opposite of the one it should have taken.

Faithful reporting on the scene in Washington would have made this unnecessary. The mischief would not have resulted if the reporters had not obstructed the flow of fact.

Why did the reporter intrude?

He is a human being. As a representative of his paper in the national capital, he wants to show his worth to his editor. He wants to cut the figure of being a man of judgment, keen to see his way through the political dodges of government officials. Especially is he keen to do this if the paper employing him is of a

"Is the Lady of the House at Home?"

Never Be Ashamed of Your Work, Advice to Canvasser

By THOMAS J. MALONE

WHEN the universities and colleges close their regular academic year, they will release, in addition to the new hosts of physicians, dentists, lawyers, engineers, druggists and teachers, an unusually large army of house-to-house canvassers. Merchandizing experts predict that the house-to-house salesmen will be abroad in the land this summer in increased numbers. As in past seasons, a large part of the recruits will come from campus populations. Enlisting and training students for the work has been going on for months at hundreds of educational institutions in the United States. Drilled to a fine edge, thousands of young men and young women are about to set forth to grapple with the closed door, the ringless doorbell and the family dog.

"Somebody's coming, mother!" It is mother's young hopeful, alert face at the front window, who calls out this beginning of drama to her, ironing in the kitchen.

The stranger walks importantly up to the front door, a grip in his hand or, perhaps, a fat portfolio under his arm. If in the country, he has probably dismounted from bicycle, motor cycle or saddle horse, or climbed out of buggy or automobile.

"It's some agent," mother will say, after a furtive peek herself. "Go away from the window, child, so he won't know anyone is at home."

This mild bit of deception will have been practised on him so often before that the approaching stranger will be ready for it, if not actually expecting it. He will keep a persistent finger on the bell button or hammer with cheery knuckles until mother has to go to the door to save her nerves. Then she will make some apologetic remark—not overlooked by the hopeful—as to why she hadn't heard him before, thus giving away that she had heard him from the first, and ask him to step in as a sort of salve to her conscience. Before she realizes it, she will have bought an "indispensable" book of information on child feeding, home treatment of colds, social forms for all occasions, toasts for after-dinner speakers, how to dress oak floors, how to remove fruit stains from linen, how to make flowers from feathers, and how to fashion a beautiful table decoration out of a pair of old hinges; or, it may be, an electric washing machine or a combination butter ladle, hand weeder and currycomb.

This little household drama, with variations, will be performed many times in the next few months. Leaders in that part of the business world that specializes in "distribution"—the process of placing merchandise from the factory into the hands of the consumer—agree that there is a marked trend back to direct selling, especially so-called "doorstep" selling. In these days of high prices, manufacturers are concerned in eliminating middlemen, in cutting out wholesaler, jobber, retailer—all store selling—and promoting a service direct to consumer. Certain goods are sold in no other way. Hence, the enlarged opportunity and demand for the university student.

Recruiting for the army of "agents," "canvassers," "solicitors," "salesmen," "representatives," as done at the big schools, is a very definite business. About the first of February each year, scores of manufacturers' representatives appear on the campuses for the spring campaign. They know exactly what they want and how to go about getting it.

At any of the institutions, they first get acquainted with the president's office, with various deans, with the campus employment bureau if one is operated and with the directors or secretaries of the religious organizations represented in student work. Also, they may advertise in student publications. Through such agencies they learn names of students who look forward to summer employment to earn money for their next year's schooling.

As a rule, a concern that expects to enlist any considerable number of students will select, early in the spring, a student of standing in the campus world for executive ability and leadership, to aid in enrolling a "crew." This student "leader" will winnow out desirable men from his acquaintances and arrange for them to meet his chief. This system enables the chief to handle several campuses at once. The "leader" may receive commissions on sales made by his men, or be paid in some other way for his service. Intense competition often obtains among these leaders, for the best men.

The chief assigns territory to the students engaged, often by counties, and drills them in selling methods—knowledge of product, how to approach a "prospect," how to win an audience, what to say, how to get the name on the dotted line, how to get the money—in brief, in the art of persuading the hearer that life has been drab and joyless for the want of the article being offered. This "drill" is a carefully wrought masterpiece, taking of which is imperative on the student canvasser. Of it, more presently.

Most of the companies represented on campuses seek recognition and approval of campus authorities, though certain ones, lacking such favor, may work among students more or less surreptitiously, even as "outlaws." The director of the student employment bureau in one of the largest state universities of the Middle West says that such bureaus are clearing houses for information as to all the better class of firms and products represented in the spring scramble for student workers; they make it possible for students to look over the offerings listed and make selections.

"We give our O. K. to a concern mainly on the factor of approval of product," this director goes on. "We formerly required also that it guarantee a minimum salary to canvassers, but we have abandoned that, for this year at least. Most of the students work solely on commission, though some on salary guaranty plus a commission on excess sales.

"For approving a firm we have a tentative condition that it do not require the student to purchase an outfit before going into the field—in some cases effecting such purchase is the real aim of the seller and results in abandoning the student — but we do not hold strictly to it. Many firms are willing to take students' notes for the value of outfits. There are two sides to the outfit question; students themselves do not always go through with agreements, and in cases of such failure companies are occasionally out the equipment furnished.

"What kinds of articles are represented? The range is wide, and varies with the times. A dozen years and more ago, stereoscopes and stereoscopic views were high in popularity, and many a student has made his way through college on the proceeds of summer canvassing with them. There is a campus tradition here of a blind student who cleaned up fabulous sums selling them through several seasons. They put him through law school. He had all his views marked so that he could identify them by touch and he knew every detail in each picture. His enthusiasm in describing them was compelling. His customers probably reasoned that if a blind man could be so much interested in the views, surely they were worth while to seeing people. Today, however, I doubt if any house is pushing them—not in our territory, surely. Motion pictures have supplanted them; they are too tame for the modern taste.

"Aluminum kitchen utensils used to be popular and remunerative household sellers. They probably would be so still, had not the company making them—or, at least, the one promoting them in our field—changed its method of distribution. Having won a reputation and a following, it now sells only through retail stores and has done away with canvassers.

"The student from this university who made the most money from canvassing last summer sold maps, of many kinds, the product of a well-known national house, whose name alone was an introduction and a selling help. He earned between $2,000 and $3,000 in the three months. Yes, he hustled. This year he is the campus representative of his house and will get commissions on the sales of all the men he hires, besides going out again himself. Both wall and pocket maps are handled, but the canvasser centers on a few 'leaders,' such as those showing parcel post zones, automobile routes, good roads and the like, for state or section.

"Brushes, silk hosiery, men's shirts, rubber coats, magazine subscriptions, vacuum cleaners, electric washing machines, clothes reels, leather novelties, fire, life and tornado insurance, groceries in car lots direct to consumers, radio sets—these suggest the range.

"Books? Yes, but not so much as formerly. The girls who go out largely cling to books, however. Some of our boys will handle this summer a live stock volume that is said to go great in the rural districts, but books in general are not favored by the students. They feel that the book agent is more or less taboo in the average American home.

"But the stock book is different. What a book! I'll admit I've read it through. It tells all about balanced rations, purebred sires, judging on the hoof, milk testing, horseshoeing and swamp fever; contains absorbing pictures of internal anatomy; and exposes intimate details of the family and private lives of cattle, horses, sheep, swine and chickens.

"New things come up right along. Here's a letter from a firm that makes straw hats and pushes their sale by the doorstep method. It wants to obtain solicitors here and offers to guarantee a minimum weekly salary with expenses, and pay a commission as well on sales over the designated quota. It requires a solicitor to have and operate an automobile.

All the large universities and many of the colleges are combed for canvassers. I suppose approximately two hundred students will go out this year from this university alone."

Is the book agent passing? Not so; it seems that it is only the old-fashioned type that is on its way out.

This was the consensus at last year's annual convention of the Subscription Book Publishers' Association of the United States. According to a statement attributed to its new president, the association purposes so to raise the standards of the subscription book business that the canvasser will be welcomed into the house with a smile, given the guest chair, handed a cup of tea and asked to write his name and a sentiment in the family album before leaving.

Drills which company experts give to student-canvassers emphasize the main points to be observed in house-to-house selling.
